When *m*-acetylaminophenol and benzotrichloride are heated at 150—160° in the presence of nitrobenzene, several substances are obtained, from which, after somewhat complicated treatment, two acetylated bases are isolated and separated from each other by alcohol. The less soluble one is *acetylaminophenylfluorone* (annexed constitution), m. p. above

360°, which crystallises in tufts of red needles, is insoluble in alkalis, and gives strongly fluorescent solutions in alcohol, glacial acetic acid, benzene, or warm dilute mineral acids. In concentrated sulphuric acid it gives a yellow solution with a strong green fluorescence, which remains unchanged by the addition of ice. By hydrolysis by moderately concentrated hydrochloric acid and boiling alcohol, it yields the chloride of the base, which crystallises in red leaflets with a blue reflex. The base, $NH_2 \cdot C_6H_5 \cdot \langle CPh \rangle \cdot C_6H_5 \cdot O$, liberated by excess

of ammonium hydroxide, has m. p. 305°, crystallises in dark red needles, forms orange-red salts, and by the elimination of the amino-group yields *phenylfluorone*, m. p. 204°, which forms orange-yellow crystals, is insoluble in alkalis or dilute mineral acids, and gives fluorescent solutions. The substance is the chromogen of fluorescein, and shows a striking analogy to *aposafranone*, *oxazone*, and *thiazone*.

Hydroxyphenylfluorone, obtained by replacing the amino-group of the preceding base by hydroxyl, is identical with Doebner's resorcinolbenzen (*Annalen*, 1878, 217, 234), and shows a remarkable similarity

in its colour phenomena to fluorescein, which, as its carboxylic acid, must have the annexed constitution (compare R. Meyer and Hoffmeyer, Abstr., 1892, 970.)

The other product isolated from the substances obtained from *m*-acetylaminophenol and benzotrichloride is *diacetylphenorosamine*, the chloride of which, $NHAc \cdot C_6H_5 \cdot \langle CPh \rangle \cdot C_6H_5 \cdot NHAc$, forms a yellow, fluorescent solution in hot water without hydrolysis. By treatment with ammonium hydroxide, the chloride is changed to a magenta-red, unstable colour base, which is spontaneously transformed to a colourless,

stable form, from which dilute acids regenerate yellow salts. By hydrolysis, the simplest rosamine is obtained as a yellowish-red, extremely fluorescent dye. C. S.

Quinonoid Ester Salts of Fluoran. ARTHUR G. GREEN and PERCY E. KING (*Ber.*, 1908, 41, 3434—3440. Compare Abstr., 1906, i, 670; 1907, i, 933).—In support of their ortho-quinonoid formula for the oxonium salts of quinolphthalein derivatives, the authors have prepared similar oxonium salts of the esters of fluoran and of 2:7-dimethylfluoran. The substances are unstable and extremely soluble, and their isolation is only possible in the form of the tin or zinc double chlorides. When hydrogen chloride is passed into hot methyl alcohol containing fluoran and stannic chloride, orange, prismatic crystals of the *stannichloride*, $\left[\text{CO}_2\text{Me} \cdot \text{C}_6\text{H}_4 \cdot \text{C} \begin{array}{c} \text{C}_6\text{H}_4 \\ \text{C}_6\text{H}_4 \end{array} \text{OCl} \right]_2 \cdot \text{SnCl}_4$, are obtained on keeping. The corresponding *stannichloride* of the ethyl ester crystallises in large, yellow prisms, containing 1 mol. EtOH. The *stannichloride* of the oxonium chloride of the methyl ester of 2:7-dimethylfluoran contains equal molecular quantities of the oxonium and of the metallic chloride; this appears to depend on the solubility, for zincchlorides containing one or two mols. of the oxonium chloride to one mol. of zinc chloride have been prepared, namely,

$\text{C}_{21}\text{H}_{16}\text{OCl}(\text{CO}_2\text{Me})_2 \cdot \text{ZnCl}_2$
 and $[\text{C}_{21}\text{H}_{16}\text{OCl}(\text{CO}_2\text{Me})]_2 \cdot \text{ZnCl}_2$.
 2:7-Dichlorofluoran, $\text{C}_{20}\text{H}_{10}\text{O}_3\text{Cl}_2$, m. p. 256—258°, is obtained by condensing phthalic anhydride and *p*-chlorophenol with concentrated sulphuric acid at 150—160°. The halogen atoms are not readily displaced, and the substance, as also the corresponding dinitrofluoran, does not readily esterify under the preceding conditions. C. S.

Dibenzopyrronium. HERMANN DECKER and HEINRICH FELSER (*Ber.*, 1908, 41, 3755—3757. Compare Abstr., 1907, i, 1064).—It has been found possible to prepare derivatives of dibenzopyrronium, the oxygen isologue of phenanthridine.

9-Phenyldibenzopyrronium may be obtained by the method of Bünzly and Decker (Abstr., 1904, i, 912), namely, by the action of magnesium phenyl bromide on diphenylmethylid (compare Graebe and Schestakoff, Abstr., 1895, i, 372). The *carbinol base* is not such a strong base as 9-phenyl-xanthonium carbinol; the *chloride* (annexed formula) dissolves in hydrochloric acid, forming a yellow solution without fluorescence; the *ferrichloride*, $\text{C}_{19}\text{H}_{13}\text{OCl}_2\text{FeCl}_3$, crystallises in lemon-yellow leaflets, m. p. 163°. W. H. G.

Preparation of 3-Oxythionaphthen. FARBERKE VORM. MEISTER, LUCIUS & BRÜNING (D.R.-P. 200200).—Methyl *o*-methylthiolbenzoate, $\text{SMe} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{Me}$, needles, m. p. 67°, volatile in steam, produced by alkylating *o*-methylthiolbenzoic acid, $\text{SMe} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{H}$, m. p. 168—169°, or the corresponding sodium, potassium, or calcium methylthiolbenzoate, when heated with sodium and potassium hydroxides (equal mols.) at 200° gives rise to 3-oxythionaphthen;

this condensation takes place even more readily when some sodium or potassium ethoxide is present in the fusion. G. T. M.

Preparation of a Dihydroxythionaphthencarboxylic Acid. FARBWERKE VORM. MEISTER, LUCIUS & BRÜNING (D.R.-P. 200202).—5-Sulphoanthranilylthiolacetic acid,

prepared from 5-sulphoaniline-2-carboxylic acid, yields a monopotassium salt; this compound when heated with alkali hydroxides, first at 130—140° and then at 160—185°, gives rise to a yellow fusion product, which, when dissolved in water and acidified, furnishes a dihydroxythionaphthen-2-carboxylic acid. On boiling with water, this acid yields a dihydroxythionaphthen, needles, m. p. 198°.

G. T. M.

[Preparation of Bases of the Adrenaline Series.] CHEMISCHE FABRIK AUF ACTIEN (VORM. E. SCHERING) (D.R.-P. 201245).—The acid reduction with sodium, potassium, or aluminium amalgams of 3:4-dihydroxyphenylglyoxime and the 3:4-dihydroxyphenylalkylglyoximes of the annexed general formula leads to the production of bases having a very intense hæmstatic action, but which are less toxic than adrenaline. Neither the bases nor their salts have yet been isolated in a pure state.

$\text{NOH}\cdot\text{C}\cdot\text{CR}\cdot\text{NOH}$

G. T. M.

Preparation of a Double Compound of Caffeine and Lithium Benzoate. PETER BERGELL (D.R.-P. 199108).—A crystalline double compound, $2\text{C}_8\text{H}_{10}\cdot\text{CO}_2\text{Li}\cdot\text{C}_6\text{H}_5\text{O}_2\text{N}_4$, is obtained in needles by evaporating below 50° under reduced pressure an aqueous solution of caffeine and lithium benzoate.

G. T. M.

Solubility of True and False Tannates of Quinine. F. MURARO (*Gazzetta*, 1908, 38, ii, 507—511).—A reply to Biginelli's criticisms (this vol., i, 562) on the author's previous paper (this vol., i 451).

T. H. P.

Preparation of α -Bromoisovalerylquinone. KNOLL & CO. (D.R.-P. 200063).—Quinine or its salts, when heated for three hours at 120° with α -bromoisovaleryl chloride or bromide, gives rise to α -bromoisovalerylquinine, an amorphous, yellow substance, dissolving in alcohols and in acids, but less soluble in benzene, toluene, light petroleum, or ether. From acid solution, it is precipitated by potassium mercuri-iodide.

G. T. M.

Synthesis of Polypeptides. XXVII. I. Derivatives of Histidine. EMIL FISCHER and LEE H. CONE (*Annalen*, 1908, 363, 107—117. Compare this vol., i, 773).—So far there has been described only one dipeptide, histidylhistidine, derived from histidine, which itself is widely spread amongst the natural proteins. It was of special interest, therefore, to undertake the synthesis of mixed peptides derived from this amino-acid, especially as these may be expected to occur amongst the degradation products of the proteins.

The combination of *l*-leucine with histidine is described in the present paper. As oxyhaemoglobin contains considerable quantities of *l*-leucine and histidine, which are present probably as a mixed dipeptide, and as *l*-leucyl-*l*-histidine is stable towards concentrated hydrochloric acid, it was hoped to find this dipeptide amongst the products of the action of concentrated hydrochloric acid on oxyhaemoglobin. In this the authors have been unsuccessful, as also, so far, in attempts to prepare the isomeride, *l*-histidyl-*l*-leucine. It is found that histidine hydrochloride is stable towards cold phosphorus pentachloride and acetyl chloride. Experiments with formylhistidine, which is described, are in progress.

d- α -Bromoisohexoyl-*l*-histidine methyl ester,

prepared from *d*- α -bromoisohexoyl chloride and histidine methyl ester (Fischer and Suzuki, Abstr., 1906, i, 73) in chloroform solution, crystallises from ethyl acetate in strongly refracting, colourless, hexagonal plates, m. p. 175° (corr.), dissolves in dilute mineral acids, and is reprecipitated by sodium carbonate.

d- α -Bromoisohexoyl-*l*-histidine, $C_{12}H_{18}O_3N_3Br$, prepared by hydrolysis of the ester with *N*-sodium hydroxide at the laboratory temperature and evaporation of the product after neutralisation with sulphuric acid, separates from water in crystals, m. p. 118° (corr.), has an acid reaction in aqueous solution, and gradually becomes yellow when dissolved in alkalis.

l-Leucyl-*l*-histidine, $C_4H_9 \cdot CH(NH_2) \cdot CO \cdot NH \cdot CH(C_4H_5N_3) \cdot CO_2H$, is best prepared by the action of 25% aqueous ammonia on the preceding bromo-compound at 25°. It separates from water in prisms or plates containing H_2O , loses H_2O at 100°/15–20 mm., when anhydrous has m. p. 178° (corr.) (decomp.), has a strong alkaline reaction in aqueous solution, gives a colourless precipitate with mercuric chloride solution and a red coloration with *p*-diazobenzenesulphonic acid,* and becomes dark coloured when boiled with dilute bromine water; these reactions show that the iminazole nucleus of the histidine is present unchanged in the dipeptide. The dipeptide is soluble in dilute acids and alkalis; the acid solutions give a heavy precipitate with phosphotungstic acid. The copper salt, $C_{12}H_{18}O_3N_3Cu \cdot 4H_2O$, formed by boiling the aqueous solution of the dipeptide with precipitated copper oxide, or by adding copper sulphate to the solution of the dipeptide in sodium hydroxide, is obtained in deep violet-blue crystals, which lose $4H_2O$, becoming lilac at 100°/15–20 mm. over phosphoric oxide, and dissolve in alcohol, forming a violet-blue solution. Whilst it is stable towards cold concentrated mineral acid, the dipeptide is hydrolysed completely in twenty-four hours by 20% hydrochloric acid at 100°, yielding *l*-leucine and *l*-histidine.

Formyl-*l*-histidine, $C_7H_9O_3N_3$, formed by heating histidine with anhydrous formic acid on the water-bath and evaporating the solution under 15–20 mm. pressure, crystallises from aqueous-methyl alcohol in slender needles, m. p. 203° (corr.), is readily soluble in water, slightly so in methyl alcohol, but almost insoluble in other organic solvents, has an acid reaction in aqueous solution, and gives a deep red coloration with *p*-diazobenzenesulphonic acid, which points to

the formyl group as having entered into combination with the amino group of the histidine.

G. Y.

Action of Ozone on Thebaine. J. D. KIEDEL (D.R.P. 201324).—Thebaine hydrochloride in 10% aqueous solution is treated with ozonised oxygen at the ordinary temperature until the product is soluble in alkali hydroxides. The ethereal extract of the solution, when dried with potassium carbonate and concentrated, furnishes a compound, $C_{15}H_{21}O_5N$, which crystallises in needles or leaflets, m. p. 125–126°. This oxidation product still contains two methyl groups, and loses one of these by alkaline hydrolysis; it has probably the formula $C_{13}H_{15}ON(CO_2Me)(CO)OMe$. The substance is readily soluble in water, ethyl acetate, and alcohol.

G. T. M.

Sparteine. New Method of Ring-formation of α -Methylsparteine by the Action of Iodine. AMAND VALEUR (*Compt. rend.*, 1908, 147, 864–867).—Although the α -methylsparteine obtained by Moureu and Valeur (this vol., i, 44) by heating methylsparteinium hydroxide is certainly an unsaturated base, since it reduces a cold sulphuric acid solution of potassium permanganate, it is not reduced by sodium and ethyl or amyl alcohol, or by tin and hydrochloric acid. It combines with iodine, however, forming *di-iodo- α -methylsparteine*, $C_{15}H_{25}N_2MeI_2$, m. p. 177–178°, which does not behave as a simple additive product, has a very feebly alkaline reaction, and when treated in aqueous solution with freshly prepared silver oxide gives a strongly alkaline liquid, from which the di-iodide is re-formed by addition of potassium iodide. The latter observation indicates that the new compound is a quaternary ammonium iodide, and therefore must be the methiodide of an iodo-base. In the action of iodine, probably the additive product is first formed, thus:

from which iodosparteine methiodide (I) or iodoisosparteine

methiodide (II) can be formed according to which iodine atom wanders to the nitrogen. Whilst zinc and water or zinc and acetic acid reduce the di-iodide, giving α -methylsparteine only, phosphorus and hydriodic acid at 120° transform it into isosparteine methiodide,

di-iodide should be represented by formula (II). It is possible, however, that the isosparteine methiodide is formed by isomeric change from the α -methylsparteine under the influence of hydrogen iodide. These results confirm the analogy which exists between the two bases dimethylpiperidine and α -methylsparteine (compare Willstätter, *Abstr.*, 1900, i, 249; Valeur, this vol., i, 736).

E. H.

Iodine Derivatives of Strychnine and Brucine. JOZEF BURACZEWSKI and TAP. KOZŃIEWSKI (*Bull. Acad. Sci. Cracow*, 1908, 644—649).—By the addition of a somewhat concentrated solution of iodine in carbon disulphide to a hot alcoholic solution of strychnine or brucine, di-iodo-derivatives are precipitated, from which the alkaloids are regenerated by alcoholic alkalis; it is not yet determined whether the compounds are produced by addition or by substitution.

The *strychnine* derivative, $C_{21}H_{22}O_2N_2I_2$ or $C_{21}H_{20}O_2N_2I_2$, m. 196—197°, forms red crystals; after prolonged boiling with alcohol, the solution deposits ruby-red crystals of a substance, $C_{21}H_{22}O_2N_2I_2$, m. p. 253—254°, which seems to be identical with Jürgensen's periodide (*J. pr. Chem.*, 1870, [i], 2, 434). The *brucine* derivative, $C_{23}H_{26}O_4N_2I_2$ or $C_{23}H_{24}O_4N_2I_2$, m. p. 222.5°, is converted, after prolonged boiling with alcohol, into a ruby-red, crystalline substance, m. p. 251—252°. C. S.

A New Base from Putrefying Pancreas. D. ACKERMANN (*Zeitsch. physiol. Chem.*, 1908, 57, 28—29).—A new base, *viridinine*, $C_8H_{12}O_3N_2$, has been isolated from ox pancreas which had been allowed to undergo decomposition by exposure to the atmosphere during two months. It may be extracted by Kutscher's method, and is found in the same fraction as δ -aminovaleric acid, but may be separated from this by means of the slight solubility of its aurichloride or platinichloride. The *hydrochloride* forms glistening, green needles, only moderately soluble in cold water, and when heated produces yellow vapours with an aromatic odour. The *aurichloride*, $C_8H_{12}O_3N_2 \cdot H_2AuCl_4$, forms glistening, blackish-green or blackish-yellow plates, or, after recrystallisation, brownish-black needles, m. p. 176° (decomp.). The *platinichloride*, $(C_8H_{12}O_3N_2)_2 \cdot H_2PtCl_6$, has an intense yellow colour, and has m. p. 212—216° (decomp.). J. J. S.

Synthesis of Polypeptides. XXVII. 2. Derivatives of Proline. [Pyrrolidine-2-carboxylic Acid]. EMIL FISCHER and GEORG REIF (*Annalen*, 1908, 363, 118—135).—Levene and Beatty isolated from the product of the tryptic digestion of gelatin a prollyglycine anhydride which, on hydrolysis, yields glycine and optically active proline (Abstr., 1906, i, 718). As other similar substances may be formed by the decomposition of proteins, it was thought of interest to study the synthesis of polypeptides derived from active proline.

L-Proline, prepared from gelatin, is best purified by conversion into the *copper* salt, $C_{10}H_{16}O_4N_2Cu$, which crystallises from alcohol in dark blue, rhombic prisms, and when treated with hydrogen sulphide in hot aqueous solution yields proline, $[\alpha]_D^{20} - 76.7^\circ$. When treated with acetyl chloride, cooled by ice, and then with phosphorus pentachloride, *L*-proline forms *L*-prolyl chloride hydrochloride, $C_8H_9N \cdot COCl \cdot HCl$. This, when treated with glycine ethyl ester in chloroform solution at -10° , and then, after removal of the chloroform and excess of glycine ester, with dilute sodium ethoxide, yields prollyglycine anhydride and a brown oil. The anhydride, on extraction with boiling ethyl acetate or acetone, is obtained in microscopic leaflets, m. p. 213° (182—183°: Levene and Beatty, *loc. cit.*), $[\alpha]_D^{20} - 216.2^\circ$ to -217.4° , has a bitter

taste, and does not give a blue coloration when boiled in aqueous solution with copper oxide.

prepared in the same manner from *l*-prolyl chloride hydrochloride and *l*-leucine ethyl ester, crystallises from water in microscopic leaflets, m. p. 160° (corr.), $[\alpha]_D^{20} - 142.6^\circ$ to -143.4° . When boiled with 2*m*. hydrochloric acid, the anhydride yields proline, $[\alpha]_D^{20} - 56.9^\circ$, and leucine, $[\alpha]_D^{20} + 10.1^\circ$; hence racemisation must have taken place to the extent of one-third of the substance during the hydrolysis.

d- α -Bromoisohexoyl-*l*-proline, $\text{CHMe}_2 \cdot \text{CH}_2 \cdot \text{CHBr} \cdot \text{CO} \cdot \text{C}_4\text{H}_7\text{N} \cdot \text{CO}_2\text{H}$, formed by the action of *d*-bromoisohexoyl chloride and sodium hydroxide on *l*-proline, separates from acetone in crystals, m. p. 158° (corr.) (decomp.). When treated with concentrated aqueous ammonia at 25°, it is converted into α -hydroxyisohexoyl-*l*-prolinamide,

which is formed also by the action of liquid ammonia on bromoisohexoylproline. It crystallises from water in prisms, m. p. 123–124° (corr.), evolves ammonia at about 140°, $[\alpha]_D^{20} - 78.3^\circ$ to -78.6° , and yields ammonia when boiled with sodium hydroxide.

α -Hydroxyisohexoyl-*l*-prolinolactone,

formed when the amide is heated at 140–145°, or when *d*- α -bromoisohexoyl-*l*-proline is treated with sodium hydroxide at the ordinary temperature, and, after twenty-four hours, is neutralised with hydrochloric acid and evaporated, crystallises from water in thin needles, m. p. 164° (corr.), $[\alpha]_D^{20} - 166.8^\circ$, has a slightly bitter taste, and behaves towards alkalis and acids in the ordinary manner of the lactones.

The substance described previously (Abstr., 1904, i, 917) as *i*-leucylproline is now found to be *i*-hydroxyisohexoyl prolinamide; on hydrolysis with acids, it yields ammonia, *dl*- α -hydroxyisohexic acid, and *dl*-proline. The anhydride, previously termed leucylproline anhydride (*loc. cit.*), is *i*-hydroxyisohexoylproline anhydride; it has m. p. 124° (corr.). G. Y.

New Isomerides of Coniine and other Hydrogenated Bases.
ICILIO GUARESCHI (*Atti R. Accad. Sci. Torino*, 1908, 43, 1095–1099. Compare following abstract).—No isomeride of coniine or other alkyl derivative of piperidine is known in which two alkyl groups are united to one and the same carbon atom. Such a derivative, namely, 2:2:4-trimethylpiperidine, should be obtainable from 5-cyano-2:2:4-trimethyldihydro-6-pyridone (compare Abstr., 1894, i, 484) by reduction with sodium and alcohol, whilst cyano-1-methylpyridones should yield the corresponding 1-methylpiperidines, 5-cyano-2:3:4-trimethyl-6-pyridone, and 2:3:4-trimethylpiperidine. In the last case, profound reduction by means of zinc dust gives 2:3:4-trimethylpyridine (compare Abstr., 1900, i, 558). Reduction of 3:5-dicyano-2:6-diketo-4-methyl-4-ethylhexahydropyridine should also give an isomeride of coniine, 4-methyl-4-ethylpiperidine, T. H. F.

New Isomeride of Coniine from 5-Cyano-2:2:4-trimethyldihydro-6-pyridone. GIOVANNI ISSOGGIO (*Atti R. Accad. Sci. Torino*, 1908, 43, 1100—1121. Compare preceding abstract).—The author has investigated the products of reduction of 5-cyano-2:2:4-trimethyldihydro-6-pyridone (compare Guareschi, *Abstr.*, 1893, i, 484) by means of (1) sodium and ethyl alcohol, and (2) sodium and amyl alcohol. The first method of reduction yields 2:2:4-trimethylpiperidine and 5-cyano-2:2:4-trimethylpiperidine (?) in small quantities, whilst the use of amyl alcohol leads to the formation of (1) 2:2:4-trimethylpiperidine, (2) a hexamethyldipiperidine, as the result of the condensing action of the excess of sodium on the preceding compound, and (3) 2:2:4-trimethylnipecotinic acid, derived from the complete hydrogenation of the pyridone and the hydrolysis of the cyanogen residue. The normal reduction of the cyanogen group to $\text{CH}_2\cdot\text{NH}_2$ by means of sodium and alcohol is not observed in this case.

5-Cyano-2:2:4-trimethylpiperidine (?), $\text{NH} \begin{array}{c} \text{CH}_2\text{—CH(CN)} \\ \text{CMe}_2\text{—CH}_2 \end{array} \text{CHMe}$, crystallises from water in mammillary masses, m. p. 155°.

2:2:4-Trimethylpiperidine, $\text{NH} \begin{array}{c} \text{CH}_2\text{—CH}_2 \\ \text{CMe}_2\text{—CH}_2 \end{array} \text{CHMe}$, is a mobile liquid, b. p. 148°, D^{15}_4 0.832, has an intense alkaline reaction, and forms white fumes with hydrogen chloride; with copper sulphate it gives a blue precipitate, soluble in excess of reagent, and with Nessler's reagent, a white precipitate. The aqueous solution of its hydrochloride gives precipitates with the ordinary alkaloidal reagents. The *platinichloride*, $(\text{C}_8\text{H}_{17}\text{N})_2\cdot\text{H}_2\text{PtCl}_6$, forms orange-red, mammillary masses, m. p. 215—216° (decomp.). The *aurichloride*, $\text{C}_8\text{H}_{17}\text{N}\cdot\text{HAuCl}_4$, crystallises in yellow prisms, m. p. 135°. With methyl iodide, it gives 2:2:4-trimethylpiperidyltrimethylammonium iodide,

which separates from a mixture of alcohol and ether as a white, crystalline powder, m. p. 266° (decomp.).

2:2:4:2':2':4'-Hexamethyldipiperidyl,

b. p. 266—267°/745 mm. and 237°/40 mm., D^{15}_4 0.869, has an odour resembling that of nicotine, and exhibits intense alkaline properties. Its *platinichloride*, $\text{C}_{16}\text{H}_{32}\text{N}_2\cdot\text{H}_2\text{PtCl}_6\cdot 3\text{H}_2\text{O}$, forms orange-yellow laminae, m. p. 262° (decomp.); its *picrate*, pale yellow needles, m. p. 230°; its *aurichloride*, $\text{C}_{16}\text{H}_{32}\text{N}_2\cdot 2\text{HAuCl}_4$, separates as a yellow powder, which changes gradually into laminae, m. p. 183—184°; its *mercurichloride*, $\text{C}_{16}\text{H}_{32}\text{N}_2\cdot 2\text{HgCl}_2$, forms short, colourless prisms, m. p. 270° (decomp.). When heated in a sealed tube with methyl iodide (2 mols.), the base (1 mol.) forms the compound, $\text{C}_8\text{H}_{16}\text{N}\cdot\text{C}_8\text{H}_{15}\cdot\text{NMe}_2\text{I}$, which is obtained as a dense oil, and, when evaporated with hydrochloric acid, gives a syrupy residue, from which the *platinichloride*,

m. p. 214°, is obtained. With 4 mols. of methyl iodide in methyl alcohol, the base (1 mol.) gives the compound,

which crystallises from methyl alcohol in monoclinic laminae, m. p. 236—237°; the action of moist silver oxide gives the corresponding hydroxide, which is an energetic base, and in presence of hydrochloric acid gives the *platinichloride*, $C_{16}H_{30}N_2Me_4Cl_2 \cdot PtCl_4$, m. p. 227—228°.

2 : 2 : 4-*Trimethylnipecotinic acid*,

crystallises from alcohol in groups of hard, white prisms, m. p. 123° (efferves.).

T. H. P.

Preparation of Basic Compounds from Methyl Ethyl Ketone. WILHELM TRAUBE (D.R.-P. 200203).—Acetone absorbs much more ammonia than its homologues, giving rise to diacetoneamine, and in smaller proportion, triacetoneamine; but by saturating an alcoholic solution of methyl ethyl ketone, a basic condensation product, $C_{12}H_{23}ON$, may be obtained, having probably the constitution $NH \begin{array}{c} \diagup CM_2Et \cdot CHMe \\ \diagdown CM_2Et \end{array} \begin{array}{c} \diagdown CH_2 \\ \diagup \end{array} CO$. In accordance with this view of its structure, the compound is called either 2 : 3 : 6-trimethyl-2 : 6-diethyl-4-piperidone or trimethyldiethylketoneamine. It is a yellow oil, b. p. 247°/740 mm. and 157—159°/30 mm.; hydrochloride, m. p. 128°; sulphate, decomposes at 188°; nitrate, m. p. 169—172°; hydrogen oxalate, m. p. 183°. Another basic product, b. p. 104°/30 mm., is also formed in this condensation; and is separated from the preceding compound by means of its more soluble oxalate.

G. T. M.

Preparation of Anthracene Derivatives containing Nitrogen. FARBENFABRIKEN VORM. FRIEDR. BAYER & Co. (D.R.-P. 199713).—It was shown previously (compare this vol., i, 699) that the acetyl derivatives of the secondary α -aminoanthraquinones, when condensed with the aid of alkalis, gave rise to products of the pyridone series. Similarly, sulphonated pyridones are obtained from the sulphonic acids of acetyl- α -methylaminoanthraquinone.

G. T. M.

Preparation of Phenoxazines. ACTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKATION (D.R.-P. 200736).—The substituted nitrohydroxydiphenylamines having the constitution :

readily give rise to phenoxazines; this reaction, however, does not take place in the absence of a substituent in position 6, denoted by X.

5-Nitrophenoxazine, reddish-violet needles, m. p. 165°, was obtained from 2 : 6-dinitro-2'-hydroxydiphenylamine by warming with 5% aqueous sodium hydroxide. The patent contains a description of six phenoxazine-carboxylic and -sulphonic acids derived from carboxy- and sulpho-nitro-2-hydroxy-diphenylamines.

G. T. M.

Some **Unsymmetrical Analogues of Indigotin**. ARMIN GROB (*Ber.*, 1908, 41, 3331—3334).—The two dyes referred to below have been recently described by Bezdrík and Friedländer (this vol., i, 674), but the author claims priority, as a patent for their preparation had been applied for by the Basler Chemische Fabrik in January—June, 1907.

8-Oxy-7-indoxylacenaphthene, $\text{C}_{10}\text{H}_6 \begin{array}{c} \text{CO} \diagup \\ \text{C} \diagdown \end{array} \text{C} \begin{array}{c} \text{CO} \diagdown \\ \text{NH} \diagup \end{array} \text{C}_6\text{H}_4$, gives an additive product with bromine, from which hydrogen bromide is expelled on heating, leaving a violet bromine-substituted dye. The solution of the leuco-compound of 8-oxy-7-indoxylacenaphthene is violet.

8-Oxy-7-oxythionaphthylacenaphthene,

may be prepared by condensing *o*-carboxyphenylthioglycolic acid with acenaphthenequinone in acetic anhydride solution. It gives a bromine additive compound, and the solution of its leuco-compound is reddish-violet.

J. C. C.

Amino-oxides of Leuco-bases of the Di- and Tri-phenylmethane Series. EUGEN BAMBERGER and LEO RUDOLF (*Ber.*, 1908, 41, 3290—3315).—The authors have investigated the action of hydrogen peroxide and of Caro's acid on tetramethyldiaminodiphenylmethane, tetramethyldiaminotriphenylmethane, and hexamethyltriminotriphenylmethane, and find that oxides are formed analogous to those obtained from dimethylaniline, etc., thus: $\text{R} \cdot \text{NMe}_2$.

4:4'-Tetramethyldiaminodiphenylmethane dioxide,

is most conveniently prepared by the use of Caro's acid. It forms hard, colourless, glistening needles, m. p. 147°. When heated, it evolves vapours of formaldehyde. The aqueous solution has a faint alkaline reaction, and does not reduce Fehling's solution or oxidise potassium iodide. When exposed for three months over concentrated sulphuric acid at 12—15 mm. pressure, the anhydrous compound, m. p. 156°, is formed. The *picrate*,

long, pale yellow needles, darkening at 130°, sintering at 145°, m. p. 150·5—151° (decomp.); *hydrochloride*,

colourless, glistening needles, turning brown at 150°, m. p. 165·5—166° (decomp.); *platinichloride*, *aurichloride*, and *hydrogen-ferrocyanide* are described. On reduction, the hydrochloride yields tetramethyldiaminodiphenylmethane, and when iron is used, traces of tetramethyldiaminobenzhydrol and tetramethyldiaminobenzophenone appear to be formed. With nitrous acid, the hydrochloride gives 3:3'-dinitrotetramethyldiaminodiphenylmethane, and when the dioxide is treated with sulphur dioxide, *tetramethyldiaminodiphenylmethane-3:3'-disulphonic acid* is produced.

By treating the dioxide with acetic anhydride and sulphuric acid, the substance undergoes intramolecular change, partly into *tetramethyldiamino-3:3'-dihydroxydiphenylmethane*,

colourless, hard, glassy prisms, m. p. 114.5–115°, and partly, with simultaneous formation of *tetramethyldiaminodiphenylmethane*, into *tetramethyldiamino-3-hydroxydiphenylmethane*, white, silky needles, m. p. 111–111.5°.

4:4'-*Tetramethyldiaminotriphenylmethane dioxide*,

crystallises with $2\text{H}_2\text{O}$ (analysis by Rudolf) or $4\text{H}_2\text{O}$ (analysis by Reber), forming white, glistening needles, m. p. 131.5–132.5°. Its properties resemble those of the diphenylmethane derivative. The anhydrous substance has m. p. 188–189° (decomp.). The *picrate*, $\text{C}_{35}\text{H}_{32}\text{O}_{16}\text{N}_8$, *platinichloride*, and *hydrogen ferrocyanide* are described. On reduction, the dioxide yields leuco-malachite-green, and, when iron is used, also probably some *tetramethyldiaminotriphenylcarbinol*.

By the action of nitrous acid, an orange-yellow, uncrystallisable powder is formed, which is probably 3:3'-*dinitrotetramethyldiaminotriphenylmethane*, $\text{CHPh}[\text{C}_6\text{H}_3(\text{NO}_2)\cdot\text{NMe}_2]_2$; on reduction, this yields 3:3'-*diaminotetramethyldiaminotriphenylmethane*, pale brown, amorphous flakes; the *platinichloride*, $\text{C}_{23}\text{H}_{26}\text{N}_4\cdot\text{H}_2\text{PtCl}_6$, was prepared. By the action of acetic anhydride and sulphuric acid, the dioxide is converted into 4:4'-*tetramethyldiamino-3:3'-dihydroxytriphenylmethane*, colourless needles, m. p. 183–184°.

4:4':4''-*Hexamethyltriaminotriphenylmethane trioxide*,

forms hair-like, colourless needles, m. p. 176°; the *picrate*,

and *platinichloride* are described. On reduction, it yields leuco-crystal-violet, and by the action of nitrous acid it gives 3:3':3''-*trinitro-4:4':4''-hexamethyltriaminotriphenylmethane*,

orange-yellow flakes, which, on reduction, furnishes 3:3':3''-*triamino-4:4':4''-hexamethyltriaminotriphenylmethane*, white needles, m. p. 221.5–223.5°; the *platinichloride* is described.

By the action of acetic anhydride and sulphuric acid, the trioxide is converted into leuco-crystal-violet and 4:4':4''-*hexamethyltriamino-3:3':3''-trihydroxytriphenylmethane*, a pale bluish-green powder.

J. C. C.

Negative Substituted Amino-oximes. II. Phenylnitroethenylamino-oxime. WILHELM STEINKOPF and CZESLAU BENEDEK (*Ber.*, 1908, 41, 3566–3568. Compare Steinkopf and Bohrmann, *Abstr.*, 1907, i, 480; this vol., i, 327).—It has been shown previously that the ease with which the halogenated and nitro-substituted ethenylamino-oximes are formed, and their comparative stability towards water, results from the negative influence of the substituting groups. It was of interest, therefore, to study the influence of a phenyl-substituting group, which is negative like the

halogens and nitro-group, but occupies a greater volume. It is now found that, whilst phenylnitroethenylamino-oxime is readily formed, it is unstable, and decomposes in a closed vessel in the course of a few days, or more slowly in an open vessel. Hydroxylamine can be detected in the cold aqueous solution of the amino-oxime.

Phenylnitroethenylamino-oxime, $\text{NO}_2\cdot\text{CHPh}\cdot\text{C}(\text{NOH})\cdot\text{NH}_2$, prepared by the action of hydroxylamine hydrochloride on a concentrated aqueous solution of sodium *aci*-phenylnitroacetonitrile at the laboratory temperature, forms white crystals, m. p. 125° , reduces mercuric chloride in cold alkaline solution, gives a violet coloration with ferric chloride, and forms a *hydrochloride*, which separates in white crystals, m. p. 153° . The amino-oxime acts as a dibasic acid, forming two series of salts. The *copper*, $\text{C}_8\text{H}_7\text{O}_3\text{N}_3\text{Cu}$, and *barium*, $(\text{C}_8\text{H}_7\text{O}_3\text{N}_3)_2\text{Ba}$, salts were analysed. G. Y.

Indigotin Group. HEINRICH WIELAND and ERWIN GMELIN (*Ber.*, 1908, 41, 3512—3517. Compare Wieland and Semper, this vol., i, 108).—The ethyl glyoximeperoxidedicarboxylate discovered by Präpper (*Annalen*, 1884, 222, 46) is converted by barium hydroxide into barium furoxandicarboxylate. This salt reacts with aniline hydrochloride, forming *isonitrosomalonanilideoxime*,

and this when warmed with acetic anhydride is converted into *cyano-N-acetylformanilideoxime*, $\text{CN}\cdot\text{C}(\text{N}\cdot\text{OH})\cdot\text{NAcPh}$. On warming with ammonium sulphide, *oxanilideoxime-thiamide*,

is formed, which, on warming with concentrated sulphuric acid, gives *α*-isatoxime, $\text{C}_6\text{H}_4\cdot\text{C}(\text{CO})\text{NH}\cdot\text{C}\cdot\text{N}\cdot\text{OH}$.

Ethyl furoxandicarboxylate is hydrolysed with baryta and heated at $30\text{--}40^\circ$ with concentrated aqueous aniline hydrochloride. The *aniline* salt of *isonitrosomalonanilideoxime* separates in yellow crystals, m. p. 133° ; the corresponding acid obtained by hydrolysis with hydrogen chloride forms colourless plates, m. p. $165\text{--}166^\circ$ (decomp.); it gives a blackish-green coloration with ferric chloride. The *barium* salt is light yellow; the *sodium hydrogen* salt, colourless. *Cyano-N-acetylformanilideoxime* crystallises in large, colourless prisms, m. p. 135° ; it does not give a coloration with ferric chloride. *Oxanilideoxime-thiamide* forms bright yellow crystals, m. p. $169\text{--}171^\circ$, and shows the characteristic dark green ferric chloride reaction. It is added in portions to sulphuric acid, maintained at 60° , and the temperature is gradually raised until sulphur dioxide fumes are evolved, when the solution is poured on to ice, neutralised, and the *α*-isatoxime extracted with ethyl acetate. E. F. A.

Hydrazones of Sugars. A. RECLAIRE (*Ber.*, 1908, 41, 3665—3671).—The *o*-, *m*-, and *p*-nitrophenylhydrazones of various sugars have been prepared in aqueous-alcoholic or in acetic acid solution. Many of them have already been described by Alberda van Ekenstein and

Blanksma (Abstr., 1904, i, 98). The following new compounds are mentioned: Dextrose forms a *m*-nitrophenylhydrazone, m. p. 115—116°, *m*-nitrophenylosazone, m. p. 228°, *o*-nitrophenylhydrazone, m. p. 148°, and *o*-nitrophenylosazone, m. p. 215—217°. Mannose forms a *m*-nitrophenylhydrazone, m. p. 162—163°, an impure *m*-nitrophenylosazone, m. p. 214° (decomp.), and an *o*-nitrophenylhydrazone, m. p. 173°. Lævulose forms an *o*-nitrophenylhydrazone, m. p. 155—156°. Galactose forms a *m*-nitrophenylhydrazone, m. p. 181—182°, and an *o*-nitrophenylhydrazone, m. p. 172. Arabinose forms a *m*- and an *o*-nitrophenylhydrazone, m. p. 179—180° and 180° respectively. Xylose forms a *m*-nitrophenylhydrazone, m. p. 130° (decomp. at 120°). Rhamnose forms a *m*- and an *o*-nitrophenylhydrazone, m. p. 104—105° and 151° respectively. C. S.

Action of Secondary *as*-Hydrazines on Carbamide. HUGO MILRATH (*Monatsh.*, 1908, 29, 909—935).—Most of the matter in this communication has already been abstracted (this vol., i, 581). Phenylbenzylsemicarbazide, when heated with acetic anhydride, yields *diacetyl-as-phenylbenzylhydrazine*, $C_{17}H_{18}O_2N_2$, m. p. 128° (compare Milrath, *loc. cit.*), which may also be prepared directly from *as*-phenylbenzylhydrazine.

Diphenyldimethylsemicarbazide may be prepared by heating carbamide (1 mol.) with *as*-phenylmethylhydrazine (2 mols.) at 170—180°.

The substance, m. p. 167—168°, described previously (*loc. cit.*), is now shown to be 1-benzylbenzopyrazolone, $C_6H_4 \begin{smallmatrix} \text{N}(\text{CH}_2\text{Ph}) \\ \text{CO} \end{smallmatrix} \text{NH}$.

It may also be prepared by acting on benzopyrazolone (anhydro-*o*-hydrazinobenzoic acid: Fischer and Renouf, Abstr., 1882, 1068) with benzyl chloride and sodium methoxide. The white, crystalline hydrochloride, $C_{14}H_{12}ON_2 \cdot HCl$, yellow, crystalline *platinichloride*, m. p. 134—138° (decomp.), and *picrate*, $C_{14}H_{12}ON_2 \cdot C_6H_3O_7N_3$, large, dark yellow plates, m. p. 154—155° (decomp.), were prepared. 1-Benzylbenzopyrazolone in alkaline solution is converted by methyl sulphate into 1-benzyl-2-methylbenzopyrazolone, $C_6H_4 \begin{smallmatrix} \text{N}(\text{CH}_2\text{Ph}) \\ \text{CO} \end{smallmatrix} \text{NMe}$, which crystallises with $1H_2O$ in long, slender, silky, white needles, softens at 65°, and has m. p. 75—80°.

1-Methylbenzopyrazolone, $C_6H_4 \begin{smallmatrix} \text{NMe} \\ \text{CO} \end{smallmatrix} \text{NH}$, obtained by heating carbamide (1 mol.) with *as*-phenylmethylhydrazine at 170—180°, and finally at 270—280°, has m. p. 153—154°. W. H. G.

Decomposition of Tetra-arylhydrazines. IV. HEINRICH WIELAND (*Ber.*, 1908, 41, 3478—3498. Compare Abstr., 1907, i, 1076).—Aromatic hydrazines are decomposed by various acid reagents in accordance with the equation: $\text{Ar}_2\text{N} \cdot \text{NAr}_2 + \text{HR} \rightarrow \text{Ar}_2\text{NH} + \text{RNR}_2$. Diarylamines and a molecule comprising the acid residue R result. In the case of hydrogen chloride, the hypothetical product will be a diarylamine containing chlorine attached to nitrogen, NAr_2Cl . Such secondary aromatic chloramines are not known, and attempts to

synthesise them have only yielded hydrazines, $\text{Ar}_2\text{N}\cdot\text{NAr}_2$, or compounds substituted in the nucleus. On decomposition of tetraphenylhydrazine, two molecules of chloroamine unite, with elimination of hydrogen chloride, in the para-position, $\text{C}_6\text{H}_5\cdot\text{NCl}\cdot\text{C}_6\text{H}_4\cdot\text{NPh}_2$. This primary product undergoes rearrangement to *p*-chloroanilinetriphenylamine, $\text{Cl}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{NPh}_2$ (Gambarjan, following abstract).

In the case of tetra-*p*-tolylhydrazine, two molecules of the chloroamine unite in the ortho-position, two mols. of hydrogen chloride being eliminated, and a completely substituted phenazine ring compound is obtained. In addition, chlorinated phenazine compounds containing two halogen atoms in the nucleus are formed, due to the oxidising action of the chloroamine. The first product of the decomposition is the violet quinonoid additive compound,

already described (Abstr., 1907, i, 1076).

Other acids act similarly to hydrogen chloride, and the primary products of the type $\text{NAr}_2\cdot\text{OR}$ are to be regarded as derivatives of the hypothetical diphenylhydroxylamine, $\text{NPh}_2\cdot\text{OH}$.

Tetra-anisylhydrazine is not obtained on oxidation of *p*-dianisylamine, but a ditertiary azine is formed by elimination of water from two molecules of the unstable hydroxylamine.

The ditertiary phenazine derivatives, conveniently termed "perazines," are stable towards oxidising agents. They form coloured salts with mineral acids, carboxylic acids, or phenols in anhydrous solvents, which are, as a rule, mono-acid, and are regarded as quaternary quinolimonium compounds. On oxidation, a series of salts of other colours are obtained, which possibly represent the *o*-quinonoidbis-phenazonium series.

By the action of hydrogen chloride in ether on tetratolylhydrazine in chloroform solution, the violet solution of the quinolimonium salt is first obtained, which changes subsequently to red, and deposits glistening, dark green, flat needles of *dichloroditolyltolazonium hydrochloride*. Alkalis decompose this into *dichloroditolylidihydrotolazine*, which is obtained from xylene in lustrous, garnet-red, four-sided prisms. It is very stable, and begins to decompose above 360° . With bromine, it forms a dark violet additive product containing one mol. of bromine. By reduction with sodium and amyl alcohol, *p*-ditolylidihydrotolazine, $\text{C}_6\text{H}_3\text{Me}\langle\text{N}(\text{C}_6\text{H}_4\text{Me})\rangle\text{C}_6\text{H}_3\text{Me}$, is quantitatively formed, crystallising in long, orange-yellow, glistening needles, m. p. 269° ; it can be distilled without decomposition. Both ditolylidihydrotolazine and its dichloro-derivative are formed by the action of hydrogen chloride on tetratolylhydrazine, but the latter is the main product.

Ditolylidihydrotolazine itself does not exhibit the properties of a base, and can be heated with aqueous acids without forming salts. With alcoholic or ethereal acid solutions, it forms dark green azonium salts, of which the *hydrochloride* is particularly characteristic; it separates in dark green, glistening, broad needles. The normal salt contains one molecule of acid, but there is a tendency to form an acid

salt. The *nitrate* forms minute, dark green needles, decomp. 256°. Decomposition of the salts with sodium hydroxide leads to the formation of basic by-products; alcoholic potassium hydroxide or zinc dust afford better means of effecting the decomposition.

Acetic acid acts very readily on tetratolylhydrazine; the solution becomes at first dark violet, owing to the formation of the quinonoid hydrazoneium acetate, and then dark green, owing to conversion into tolazonium acetate. On adding water, *p*-ditolylamine separates, and dityldihydrotolazine may be obtained from the mother liquors.

Phosphoryl chloride or phosphorus trichloride and benzoyl chloride do not react with tetratolylhydrazine in the absence of water. When moisture is present, large, dark green crystals are obtained; their formation is due to the hydrogen chloride slowly liberated by the chlorides, which gives rise to dichlorotolazonium chloride and phosphate.

p-*Dianisylamine*, $(\text{OMe}\cdot\text{C}_6\text{H}_4)_2\text{NH}$, prepared by Goldberg's method (this vol., i, 17), does not yield tetra-anisylhydrazine on oxidation, but an *azine*, $\text{C}_{26}\text{H}_{26}\text{O}_4\text{N}_2$, crystallising in stellar aggregates of bright, yellow needles, m. p. 290°. The *anisazonium* salts are similar to the tolazonium compounds; the *hydrochloride* forms green, glistening needles; the *nitrate* is obtained as a wine-red precipitate, m. p. 223° (decomp.). The *ferrichloride* separates in bronze, glistening, violet-red plates; the *chromate* forms dark red needles; the *platinichloride* is insoluble in water, and likewise the *ferro*- and *ferri-cyanides*, of which the former yields a rose-red, the latter a brownish-red, precipitate.

Wool is quickly dyed by anisazonium salts in fast, scarlet-red shades. Anisazonium chloride is dissolved by pyridine without change, but gives an intense sea-blue coloration with aniline. Oxidising agents convert the anisazonium salts into green compounds, which are unstable, and pass slowly in solution into carmine substances. The new perazonium salts have characteristic absorption bands in their spectra.

E. F. A.

Decomposition of Tetraphenylhydrazine with Hydrogen Chloride. STEFAN GAMBARJAN (*Ber.*, 1908, 41, 3507--3512).—In a previous paper (Wieland and Gambarjan, *Abstr.*, 1906, i, 453) it was stated that tetraphenylhydrazine, when treated with hydrogen chloride in anhydrous ethereal solution, formed diphenylamine hydrochloride and *p*-chlorodiphenylamine. It is now found that the latter compound is not produced, but that a secondary base, *p*-chloroanilino-triphenylamine, is formed. The constitution of this has been established by elimination of the chlorine by means of sodium and the identification of the product with *anilino-triphenylamine* (triphenyl-*p*-phenylenediamine), prepared synthetically by treating diphenylamine with *p*-iodonitrobenzene, reducing the nitro group, acetylating, and again treating with iodobenzene.

The decomposition of the tetraphenylhydrazine is quantitative. The dark green quinolimonium salt is first formed, and decomposes

to colourless diphenylamine and diphenylchloroamine. Two molecules of the latter then interact, and chlorine is eliminated.

p-Chloroanilinotriphenylamine, $\text{NPh}_3 \cdot \text{C}_6\text{H}_4 \cdot \text{NH} \cdot \text{C}_6\text{H}_4\text{Cl}$, has b. p. $205-215^\circ/0.01$ mm., m. p. $77-81^\circ$, and forms a crystalline hydrochloride and an acetyl derivative, m. p. $199-200^\circ$. *p*-Anilinotriphenylamine, prepared from this by means of sodium, has m. p. 134° , and yields an acetyl derivative, m. p. 184° .

p-Nitrotriphenylamine crystallises in rectangular plates, m. p. 144° , insoluble in acetic acid. *p*-Aminotriphenylamine has m. p. $145-148^\circ$, and forms an acetyl derivative, crystallising in silvery plates, m. p. 195° .

E. F. A.

Action of *N*-Amino-compounds on Bromocoumalinic Acid Esters. CARL BÜLOW and HANS FILCHNER (*Ber.*, 1908, **41**, 3281—3285).—Compounds containing two similar ring systems united by the $>\text{N} \cdot \text{N} <$ group have been described by Bülow and Sautermeister (*Abstr.*, 1904, i, 690) and by von Pechmann and Mills (*Abstr.*, 1904, i, 1042). Bülow (*Abstr.*, 1906, i, 905; 1907, i, 99) has also prepared a compound containing two different five-membered rings united by the same grouping. The authors have not succeeded in preparing a compound containing a five-membered and a six-membered ring joined together by the group $>\text{N} \cdot \text{N} <$.

5-Methyl 3':4'-diethyl 1'-(3-bromo-5-carboxy-2-pyridonyl)-2':5'-dimethylpyrrole-3':4'-dicarboxylate,

prepared by condensing methyl bromocoumalinate with ethyl 1-amino-2:5-dimethylpyrrole-3:4-dicarboxylate in presence of glacial acetic acid, forms colourless needles, m. p. 155° .

Methyl 3-bromo-1-carbamido-2-pyridone-5-carboxylate,

prepared by condensing semicarbazide with methyl bromocoumalinate, forms colourless needles, m. p. 223° . On hydrolysis, it yields 3-bromo-1-carbamido-2-pyridone-5-carboxylic acid, m. p. 252° . J. C. C.

Preparation of 5:5-Dialkylbarbituric Acids. CHEMISCHE FABRIK AUF ACTIEN (VORM. E. SCHERING) (*D.R.P.* 201244).—Dimethyl- and diethyl-malonylguanidines, when hydrolysed with boiling 10% sulphuric acid, or at 120° with concentrated hydrochloric or hydrobromic acid, give rise to the corresponding 5:5-dialkylbarbituric acids. G. T. M.

4:6-Dihydroxy-2-phenylpyrimidine. E. L. PINNER (*Ber.*, 1908, **41**, 3317—3519).—4:6-Dihydroxy-2-phenylpyrimidine, $\text{C}_{10}\text{H}_8\text{O}_2\text{N}_2$, produced by the interaction of equivalent quantities of benzamidine hydrochloride and ethyl malonate in the presence of sodium ethoxide at the ordinary temperature, forms crystals, m. p. $325-330^\circ$. It is converted by bromine in glacial acetic acid into 5-bromo-4:6-dihydroxy-2-phenylpyrimidine, $\text{C}_{10}\text{H}_7\text{O}_2\text{N}_2\text{Br}$, crystallising in pale yellow needles, m. p. 320° (decomp.), and by acetic anhydride into a monoacetate,

$C_{12}H_{10}O_2N_2$, glistening, flat prisms, m. p. 195° , and a *diacetate*, $C_{14}H_{12}O_4N_2$, brilliant, flat prisms, m. p. $93-94^\circ$. 4-Hydroxy-6-ethoxy-2-phenylpyrimidine, $C_{12}H_{12}O_3N_2$, is formed by heating the dihydroxy-compound with ethyl bromide and an alcoholic solution of potassium hydroxide under pressure at 100° ; it crystallises in flat prisms, m. p. 174° .

W. H. G.

Pyrimidines. XXXVIII. Syntheses of some Benzyl Derivatives of Uracil and Thymine. TREAT B. JOHNSON and JOHN H. DERBY, jun. (*Amer. Chem. J.*, 1908, 40, 444-458).—The authors have synthesised 1- and 3-benzyluracil and 1- and 3-benzylthymine.

2-Ethylthiol-6-oxy-1-benzylpyrimidine, $N \begin{smallmatrix} \text{C(SET) \cdot N(CH}_2\text{Ph)} \\ \text{CH} \text{---} \text{CH} \end{smallmatrix} \text{CO}$, prepared by the action of benzyl chloride on 2-ethylthiol-6-oxy-pyrimidine, forms prisms, m. p. 77° . 2-Ethylthiol-6-oxy-3-benzylpyrimidine, $CH_2Ph \cdot N \begin{smallmatrix} \text{C(SET) \cdot N} \\ \text{CH} \text{---} \text{CH} \end{smallmatrix} \text{CO}$, formed by the same reaction and isolated through its insolubility in ether, crystallises in long slender prisms and hexagonal prisms or flat tablets, m. p. 136° . 5-Bromo-2-ethylthiol-6-oxy-3-benzylpyrimidine, prepared by the interaction of benzyl chloride and 5-bromo-2-ethylthiol-6-oxy-pyrimidine (Wheeler and Johnson, *Abstr.*, 1904, i, 624), crystallises in needles, m. p. 129° . 1-Benzyluracil, $NH \begin{smallmatrix} \text{CO \cdot N(CH}_2\text{Ph)} \\ \text{CH} \text{---} \text{CH} \end{smallmatrix} \text{CO}$, prepared by evaporating 2-ethylthiol-6-oxy-1-benzylpyrimidine with hydrochloric acid, forms prismatic crystals, m. p. 175° . It gives a red colour with diazobenzenesulphonic acid. 3-Benzyluracil, prepared similarly from 2-ethylthiol-6-oxy-3-benzylpyrimidine, crystallises in stout prisms, m. p. 173° . It gives only a yellow colour with diazobenzenesulphonic acid (distinction from 1-benzyluracil). 5-Bromo-3-benzyluracil, prepared by brominating 3-benzyluracil or by digesting 5-bromo-2-ethylthiol-6-oxy-3-benzylpyrimidine with concentrated hydrochloric acid, forms hexagonal prisms, m. p. 204° . 5-Nitro-3-p-nitrobenzyluracil,

prepared by nitrating 3-benzyluracil, crystallises in slender prisms, decomposing at $235-240^\circ$. 3-Benzyl-1-methyluracil,

prepared by treating 3-benzyluracil with methyl iodide or from 1-methyluracil and benzyl chloride, forms needles, m. p. 75° . On bromination, it gives 5-bromo-3-benzyl-1-methyluracil, which is also formed by the interaction of methyl iodide and 5-bromo-3-benzyluracil; it crystallises in diamond-shaped prisms, m. p. 123° . 2-Ethyl-

thiol-6-oxy-1-benzyl-5-methylpyrimidine, $N \begin{smallmatrix} \text{C(SET) \cdot N(CH}_2\text{Ph)} \\ \text{CH} \text{---} \text{CMe} \end{smallmatrix} \text{CO}$,

prepared by the interaction of benzyl chloride and 2-ethylthiol-6-oxy-5-methylpyrimidine, forms stout prisms, m. p. 70° ; in the same reaction there is also formed (insoluble in ether) 2-ethylthiol-6-oxy-3-benzyl-5-methylpyrimidine, crystallising in hexagonal plates, m. p.

21—122°. 1-Benzylthymine, $\text{NH} \begin{array}{c} \text{CO} \cdot \text{N}(\text{CH}_2\text{Ph}) \\ \text{CH} = \text{CMe} \end{array} \text{CO}$, prepared by digesting 2-ethylthiol-6-oxy-1-benzyl-5-methylpyrimidine with concentrated hydrochloric acid, forms clusters of radiating prisms, m. p. 204—205°; with diazobenzenesulphonic acid it gives a claret-red solution. 3-Benzylthymine, $\text{CH}_2\text{Ph} \cdot \text{N} \begin{array}{c} \text{CO} \cdot \text{NH} \\ \text{CH} : \text{CMe} \end{array} \text{CO}$, similarly prepared from 2-ethylthiol-6-oxy-3-benzyl-5-methylpyrimidine, forms diamond-shaped prisms, m. p. 160°. It gives only a yellow colour with diazobenzenesulphonic acid. 3-Benzyl-1-methylthymine, obtained by the action of methyl iodide on 3-benzylthymine, forms prismatic crystals, m. p. 101°; it does not react with diazobenzenesulphonic acid. On nitration it yields 5-nitro-4-hydroxy-3-p-nitrobenzyl-dihydrothymine, $\text{NO}_2 \cdot \text{C}_6\text{H}_4 \cdot \text{CH}_2 \cdot \text{N} \begin{array}{c} \text{CO} \text{---} \text{NH} \\ \text{CH}(\text{OH}) \cdot \text{CMe}(\text{NO}_2) \end{array} \text{CO}$, which forms prisms decomposing at 176°.

J. C. C.

Preparation of 4-Dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone. EMIL SCHEITIN (D.R.-P. 199844).—4-Dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone is readily obtained in good yield by heating 4-sulphonylamino-1-phenyl-2:3-dimethyl-5-pyrazolone with methyl sulphate in alcoholic solution at 100—115° (compare this vol., i, 688).

G. T. M.

Preparation of Chlorobromindigotin. GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL (D.R.-P. 198816. Compare this vol., i, 695).—Chlorobromindigotin, obtained by heating at 226° in nitrobenzene, chloroindigotin (1 mol.) and bromine (1 mol.), is a blue, crystalline powder, sparingly soluble in water, alcohol, or benzene, but dissolving more readily in warm aniline or nitrobenzene.

On reduction with alkaline reducing agents, it furnishes a light yellow leuco-derivative.

G. T. M.

Halogen Indigotins. CARL G. SCHWALBE and HERMANN JOCHHEIM (*Ber.*, 1908, 41, 3796—3798).—A table is given of the colours of *o*-, *m*-, and *p*-dichloroindigotin and indigotin in sulphuric acid, alcohol, chloroform, acetic acid, pyridine, aniline, and nitrobenzene solutions, together with observations on the preparation of the three chloro-*o*-nitrobenzaldehydes; Müller's fourth isomeride is a mixture of *m*-chloro-*o*-nitrobenzaldehyde and unchanged aldehyde. W. R.

Halogen Indigotinsulphonic Acids. CARL G. SCHWALBE and HERMANN JOCHHEIM (*Ber.*, 1908, 41, 3798—3802).—A halogen phenylglycine mixed with sand, when washed with excess of cold sulphuric acid (60% SO_3), yields a halogen indigotinsulphonic acid; the purification is carried out by extraction with amyl alcohol and fractional precipitation with petroleum or benzene, the usual methods not giving satisfactory results. *m*-Chlorophenylglycine gives a tetrachlorotetrasulphonic acid; the *p*-chloro-derivative, a dichlorohexasulphonic acid, and the 2:4-dichloro-compound, a tetrachlorodisulphonic acid; *o*-chlorophenylglycine does not form a dye; the *o*-bromo-

compound gives a dye which does not contain halogen. A comparison of the aqueous solutions of these sulphonic acids and indigo-carmin as regards colour and dyeing properties is given. W. R.

Constitution of the Acid Derivatives of Methylhydrazine.
AUGUST MICHAELIS and ERICH HADANCK (*Ber.*, 1908, **41**, 3285—3296).

—In attempting to prepare 5-phenyl-1-methyl-3-pyrazolone by the action of phosphorus trichloride on a mixture of ethyl benzoylacetate and an acid derivative of methylhydrazine, the authors invariably obtained 3-phenyl-1-methyl-5-pyrazolone, which is also produced by the condensation of methylhydrazine and ethyl benzoylacetate. As 3-pyrazolones are so often obtained by Michaelis and Mayer's reaction, the above fact could only be explained by the migration of the methyl group from the one nitrogen atom to the other, or else by the more probable assumption that the acid derivatives of methylhydrazine employed have an unsymmetrical constitution. The authors find that methylsemicarbazide, methylthiosemicarbazide, and mono- and dibenzoylmethylhydrazines have an unsymmetrical constitution, as they condense readily with aldehydes with the formation of hydrazones, whilst oxalyldimethylhydrazine appears to be symmetrically constituted.

Benzylidenemethylsemicarbazide, $\text{NH}_2\cdot\text{CO}\cdot\text{NMe}\cdot\text{N}:\text{CHPh}$, prepared by the action of benzaldehyde on methylsemicarbazide, forms white needles, m. p. 162° . *p-Methoxybenzylidenemethylsemicarbazide*,

similarly prepared from anisaldehyde, forms silky needles, m. p. 191° . The constitution of methylsemicarbazide is therefore

and, in accordance with this, it reacts with carbon disulphide to form *bis-methylcarbamidothiocarbamide*, $\text{CS}(\text{NH}\cdot\text{NMe}\cdot\text{CO}\cdot\text{NH}_2)_2$, white needles, m. p. $253\cdot5^\circ$. When methylhydrazine is treated with carbon disulphide, there is formed the *salt*, $\text{NHMe}\cdot\text{NH}\cdot\text{CS}\cdot\text{S}\cdot\text{NH}_2\cdot\text{NHMe}$, which loses hydrogen sulphide and yields *bis-methylaminothiocarbamide*, $\text{CS}(\text{NH}\cdot\text{NHMe})_2$, white needles, m. p. 241° .

Phenylbenzylidenemethylthiosemicarbazide, $\text{NHPh}\cdot\text{CS}\cdot\text{NMe}\cdot\text{N}:\text{CHPh}$, prepared by the interaction of benzaldehyde and phenylmethylthiosemicarbazide, forms long, glistening needles, m. p. $131\cdot5^\circ$.

Benzoylbenzylidenemethylhydrazine, $\text{NMeBz}\cdot\text{N}:\text{CHPh}$, prepared by the interaction of benzaldehyde and crude *monobenzoylmethylhydrazine* (an oil from benzoic anhydride and methylhydrazine), forms small, white needles, m. p. 82° .

Benzoylanisylidenemethylhydrazine, $\text{NMeBz}\cdot\text{N}:\text{CH}\cdot\text{C}_6\text{H}_4\cdot\text{OMe}$, prepared from anisaldehyde, forms slender, white needles, m. p. 115° . When benzoylmethylhydrazine in alcoholic or ethereal solution is shaken with yellow mercuric oxide, an oil is obtained which has the properties of a tetrazone; this could not, however, be prepared in the pure state.

Dibenzoylmethylhydrazine can be prepared by treating methylhydrazine with benzoic anhydride; it has m. p. 145° (von Brünig, *Abstr.*, 1890, 23, gives 143°).

Diacetyl-methylhydrazine, $\text{NMeAc} \cdot \text{NHAc}$, is a colourless oil, b. p. 280° .

Oxalyl-dimethylhydrazine does not yield a hydrazone with either benzaldehyde or anisaldehyde. J. C. C.

Constitution of the Endoxypyrrrodiazoles [4:5-Oxy-1:2:5-osotriazoles]. GIACOMO PONZIO (*Gazzetta*, 1908, 38, ii, 522-524. Compare Abstr., 1898, i, 386; 1899, i, 717, 827; 1900, i, 588; 1901, i, 169; 1902, i, 190).—The author's conclusion, that the compounds obtained by the oxidation of the hydrazoximes (*loc. cit.*) contain the nucleus $\text{O} \begin{array}{c} \text{N} \cdot \text{N} \\ \diagup \quad \diagdown \\ \text{C} \quad \text{C} \end{array} \text{N}$, is confirmed by the recent work of Wieland

and Semper (this vol., i, 108), who find that phosphorus pentachloride does not react with compounds containing the group $\text{N}:\text{O}$, whilst it readily transforms compounds containing the complex $\text{O} \begin{array}{c} \text{C} \\ \diagup \quad \diagdown \\ \text{N} \end{array}$ into the corresponding compounds containing the grouping :C:N .

The interaction of phosphorus pentachloride and 4:5-oxy-1-phenyl-3:4-dimethyl-1:2:5-osotriazole yields 1-phenyl-3:4-dimethyl-1:2:5-osotriazole, which partly undergoes chlorination to 1-*p*-chlorophenyl-3:4-dimethyl-1:2:5-osotriazole. T. H. P.

Cain's Theory of Diazo-compounds and Ammonium Salts.

ARTHUR HANTZSCH (*Ber.*, 1908, 41, 3532-3536).—A criticism of Cain's theory of diazo-compounds (compare *Trans.*, 1907, 91, 1049) and of ammonium salts. The main objections raised by the author are briefly as follows: (1) diazobenzene salts have the properties of true benzene derivatives, and not those of derivatives of dihydro-

benzene, as represented by the annexed formula; (2) the behaviour of diazo-salts when reduced or oxidised, or when treated with halogen, is not in agreement with the presence of an unsaturated ring, as shown by this formula; (3) a compound having such a constitution, when reduced, should yield *p*-phenylenediamine; (4) since both normal and isodiazo-compounds are very similar in their chemical behaviour,

they cannot be represented by formulæ so different as those annexed. The fact that the isomeric diazocyanides give similar absorption spectra (compare Dobbie and Tinkler, *Trans.*, 1905, 87, 273) shows that these compounds must have very similar constitutions; (5) if tetraethylammonium chloride has the formula $\text{NEt}_4 \cdot \text{Cl} \cdot \text{Et}$, and undergoes ionisation in aqueous solution, thus: $\text{NEt}_3 \cdot \text{Cl} \cdot \text{Et} \rightarrow \text{NEt}_3 + \text{Et} \cdot \text{Cl} \rightarrow \text{NEt}_4^+ + \text{Cl}^-$, it should be possible to detect the triethylamine and ethyl chloride produced as intermediate products, since these compounds interact but very slowly at low temperatures. As the formation of these compounds cannot be detected, the above supposition is untenable. W. H. G.

Decomposition of Diazo-solutions. ARTHUR HANTZSCH and KENWORTHY J. THOMPSON (*Ber.*, 1908, 41, 3519-2532).—An

investigation on the rates of decomposition of aqueous solutions of various diazo-salts, carried out with the object of clearing up several points which were still unsettled (compare Schwalbe, Abstr., 1905, i, 618; Cain, *ibid.*, i, 724).

Freshly prepared diazobenzene chloride contains traces of a substance, the nature of which could not be determined, which acts as a preservative. It disappears when the diazo-compound is kept for some time in a desiccator, or when a current of dry air is passed over the substance; consequently, solutions of the freshly prepared salt are more stable ($k=0.0008-0.0009$) than those of the substance which has been kept for some days, or treated with a current of dry air, when the maximum value of k found was 0.00118 (compare Hantzsch and Osswald, Abstr., 1900, i, 703; Euler, Abstr., 1903, i, 298). It is therefore evident that the keeping qualities of aqueous solutions of diazo salts may be greatly influenced by very slight traces of unknown impurities. Diazobenzene bromide in dilute solutions decomposes at about the same rate as the chloride. The velocity of decomposition increases slowly with the concentration, the increase in the case of the bromide being slightly greater than that of the chloride, probably because the undissociated bromide is less stable than the undissociated chloride. Further, the velocity of decomposition increases with the decomposition of the salt; this is probably due to the formation of a halogenated benzene, produced by the action of the hydrogen halide which is liberated. Diazobenzene iodide, even in very dilute solutions, decomposes far more rapidly than the chloride or bromide, probably because the chief reaction which takes place in this case, namely, the formation of iodobenzene, proceeds at a greater rate than the production of phenol. A velocity constant could not be obtained, owing to the complexity of the many reactions which take place during the decomposition of solutions of diazonium iodides.

The rate of decomposition of *p*-nitrodiazobenzene chloride increases with the concentration; since it is greatly accelerated by light, the solutions were kept as far as possible in the dark, the value obtained being $k=0.00020$ at 50° ($v=9$). Neither hydrochloric acid nor acetic acid influences the rate of decomposition of solutions of pure *p*-nitrodiazobenzene chloride to any marked degree (compare Schwalbe, *loc. cit.*).

Diazo-acetates in aqueous solution do not decompose in a normal manner; the weaker the diazo-base the more abnormal is the course of the reaction. As was stated by Schwalbe, the presence of sodium chloride increases the stability of solutions of *p*-nitrodiazobenzene acetate.

Solutions of diazo-salts are slowly decomposed by nitrous acid (compare Cain, *loc. cit.*); the nitrous acid does not act as a catalyst, as stated by Schwalbe, but slowly disappears, since it is directly concerned in the decomposition.

W. H. G.

[Preparation of Disazo-derivatives of 2-Amino-*p*-cresol.]
ANILINFARBEN & EXTRACT FABRIKEN VORM. J. R. GEIGY (D.R.P. 201377).—2-Amino-*p*-tolyl toluene-*p*-sulphonate, $C_7H_7SO_3 \cdot O \cdot C_7H_7NH_2$,

lustrous prisms, m. p. 78°, is obtained by reducing 2-nitro-*p*-tolyl toluene-*p*-sulphonate; it couples with diazonium salts and diazoaryl-sulphonic acids, yielding diazotisable *p*-aminoazo-derivatives, such as sodium sulphobenzene-5-azo-2-amino-*p*-tolyl toluene-*p*-sulphonate,
 $\text{SO}_3\text{Na}\cdot\text{C}_6\text{H}_4\cdot\text{N}_2\cdot\text{C}_6\text{H}_5(\text{NH}_2)\cdot\text{O}\cdot\text{SO}_2\cdot\text{C}_7\text{H}_7$.

The diazo-compounds of these *p*-aminoazo-derivatives couple with naphthol in alkaline solution, and the resulting disazo-derivatives give valuable colouring matters on removing the toluene-*p*-sulphonic group by hydrolysis.

G. T. M.

Azo-derivatives of 2-Chloro-*p*-anisidine- and 2-Chloro-*p*-phenetidine-sulphonic Acids. ACTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKEN (D.R.-P. 189469).—Insoluble coloured salts of the azo-compounds, $\text{NaSO}_3\cdot\text{C}_6\text{H}_4\text{Cl}(\text{OMe})\cdot\text{N}_2\cdot\text{C}_{10}\text{H}_7\cdot\text{OH}$ and

are produced by double decomposition with barium or other metallic chlorides. When mixed with aluminium hydroxide, these substances give rise to scarlet lakes of great brilliancy and fastness. G. T. M.

Azo-derivatives of Phenol and of the Phenolcarboxylic Acids. EUGENE GRANDMOUGIN and HANS FREIMANN (*J. pr. Chem.*, 1908, [ii], 78, 384—408).—A continuation and extension of former work (compare Abstr., 1907, i, 664, 986, 987; this vol., i, 926).

Azo-derivatives of Phenols.—The benzenesulphonyl ester of *p*-hydroxyazobenzene crystallises in yellow needles, m. p. 109°. The acetyl derivative of bis-benzeneazophenol has m. p. 116°, and the benzenesulphonyl ester forms yellowish-brown needles, m. p. 99°. The benzenesulphonyl ester of tris-benzeneazophenol forms red crystals, m. p. 202°.

o-Tolueneazophenol has m. p. 107—108° (Noelting and Werner, Abstr., 1891, 212, give 102—103°; Paganini, Abstr., 1891, 556, gives 101°); the acetyl derivative crystallises in reddish-yellow leaflets, m. p. 68°, and the benzenesulphonyl ester forms small, orange leaflets, m. p. 64°. Bis-*o*-tolueneazophenol has m. p. 116° (Noelting and Werner, *loc. cit.*, give 146°; Paganini, *loc. cit.*, gives 116°). The acetyl derivative forms reddish-yellow needles, m. p. 75—76°. When bis-*o*-tolueneazophenol is prepared from diazotised *o*-toluidine and ethyl *p*-hydroxybenzoate, it has m. p. 150°, and the acetyl derivative has m. p. 98°. The nature of this difference is not yet known.

Bis-*m*-tolueneazophenol forms yellowish-brown needles, m. p. 94°; the acetyl derivative crystallises in yellow needles, m. p. 75°. Tris-*m*-tolueneazophenol, prepared by the action of *m*-diazotoluene on salicylic acid, forms brown needles, m. p. 160°. The acetyl derivative of *p*-tolueneazophenol has m. p. 95°; the benzenesulphonyl ester forms brownish-yellow leaflets, m. p. 114°. Bis-*p*-tolueneazophenol has m. p. 176°, and the acetyl derivative has m. p. 138° (Goldschmidt and Pollak, Abstr., 1892, 974, give 170° and 128° respectively). Tris-*p*-tolueneazophenol forms brownish-red needles, m. p. 238°; the acetyl derivative crystallises in golden needles, m. p. 187°. 2-*p*-Nitrobenzene-azo-4-benzeneazophenol, prepared by treating *p*-hydroxyazobenzene with

diazotised *p*-nitroaniline, has m. p. 196°; the *acetyl* derivative has m. p. 189°. 4-*p*-Nitrobenzeneazo-2-benzeneazophenol, prepared from *o*-hydroxyazobenzene and diazotised *p*-nitroaniline, has m. p. 189°; the *acetyl* derivative has m. p. 154°. 4-Acetylamino-2-*p*-nitrobenzeneazophenol, prepared by the interaction of *p*-nitrodiazobenzene and *p*-acetylamino-phenol, forms brown needles, m. p. 227°; it is hydrolysed by 60% sulphuric acid to 4-amino-2-*p*-nitrobenzeneazophenol, golden crystals, m. p. 211°. β -Naphthaleneazophenol forms bronze needles, m. p. 240°; the *acetyl* derivative crystallises in brown needles, m. p. 180°.

Azo-derivatives of Salicylic Acid.—Methyl *p*-nitrobenzeneazosalicylate forms silky, orange needles, m. p. 166°; the *acetyl* derivative forms orange-yellow needles, m. p. 131°. The *acetyl* derivative of phenyl benzeneazosalicylate (Limpricht, Abstr., 1891, 1036) forms golden needles, m. p. 132°. Limpricht's phenyl bis-benzeneazosalicylate is hydroxyazobenzene. Phenyl *p*-nitrobenzeneazosalicylate crystallises in yellow needles, m. p. 165°; the *acetyl* derivative forms yellow needles, m. p. 155°. *o*-Nitrobenzeneazosalicylaldehyde forms brown crystals, m. p. 141°; the phenylhydrazone forms brown needles, m. p. 192°. Methyl bis-benzeneazosalicylate forms brown crystals, m. p. 141°; the *acetyl* derivative forms yellowish-red needles, m. p. 145°. Methyl bis-*o*-tolueneazosalicylate forms brownish-yellow needles, m. p. 154°. Bis-*m*-tolueneazosalicylic acid forms brownish-olive needles, m. p. 210°; the *acetyl* derivative forms yellow needles, m. p. 170°. Bis-*p*-tolueneazosalicylic acid crystallises in brown, felted needles, m. p. 214°; the *acetyl* derivative forms reddish-brown tablets, m. p. 195°. These bisazo-derivatives of salicylic acid are all prepared in alkali hydroxide solution.

Azo-derivatives of p-Hydroxybenzoic Acid.—The *acetyl* derivative of benzeneazo-*p*-hydroxybenzoic acid has m. p. 205°, not 198–199° as previously given. *o*-Tolueneazo-*p*-hydroxybenzoic acid crystallises in orange-yellow needles, m. p. 223°. In the preparation of this substance from diazotoluene chloride and *p*-hydroxybenzoic acid in alkali hydroxide solution, there are also formed bis-*o*-tolueneazophenol and *o*-tolueneazoinazole; the *acetyl* derivative of the latter forms golden-yellow needles, m. p. 163°, and the benzoyl derivative, yellow needles, m. p. 179.5°. *p*-Tolueneazo-*p*-hydroxybenzoic acid forms yellow needles, m. p. 236°; the *acetyl* derivative forms yellow needles, m. p. 205°.

Ethyl benzeneazo-*p*-hydroxybenzoate (Anwers and Röhrig, Abstr. 1897, i, 341) is readily prepared by the action of diazobenzene chloride on ethyl *p*-hydroxybenzoate; the *acetyl* derivative forms yellowish orange needles, m. p. 137°. Ethyl *o*-tolueneazo-*p*-hydroxybenzoate has m. p. 105°.

Azo-derivatives of m-Hydroxybenzoic Acid.—Benzeneazo-*m*-hydroxybenzoic acid has m. p. 221° (Limpricht, loc. cit., gives 213°); the methyl ester forms brown needles, m. p. 78–79°. Bis-benzeneazo-*m*-hydroxybenzoic acid occurs in two isomeric forms, namely, the 2:6 and the 4:6-bis-benzeneazo-derivatives. Of these, the α -acid (not specified) forms brown needles, m. p. 222–223°, and the β -acid has m. p. 226–227°; it is sparingly soluble in methyl alcohol, whilst the

acid is readily soluble in this solvent. The *methyl ester* of the β -acid forms bronze-yellow, felted needles, m. p. 183°. J. C. C.

Azobenzene-*p*-hydrazinesulphonic Acid resulting from the Action of Sulphur Dioxide on Diazobenzene Sulphate and its Condensation with Aldehydes and Ketones. JULIUS TRÖGER and O. MÜLLER (*J. pr. Chem.*, 1908, [ii], 78, 369—383).—In continuation of previous work (Tröger, Berlin, and Franke, *Abstr.*, 1906, i, 994), the authors have prepared a further number of hydrazones by condensing azobenzene-*p*-hydrazinesulphonic acid with aldehydes and ketones in the presence of glacial acetic acid or alcoholic hydrochloric acid.

Benzeneazo-p-tolylidene-p-hydrazone,

prepared from *p*-tolualdehyde, crystallises in orange-yellow needles, m. p. 178°; the *hydrochloride* forms small, blue needles. *Benzeneazo-cumylidene-p-hydrazone*, $\text{C}_6\text{H}_5\cdot\text{N}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{N}:\text{CH}\cdot\text{C}_6\text{H}_4\cdot\text{C}_3\text{H}_7$, prepared from cuminaldehyde, forms yellowish-red needles, m. p. 144—145°; the *hydrochloride* is dark blue. *Benzeneazo-m-chlorobenzylidene-p-hydrazone*, $\text{C}_6\text{H}_5\cdot\text{N}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{N}:\text{CH}\cdot\text{C}_6\text{H}_4\text{Cl}$, prepared from *m*-chlorobenzaldehyde, forms small, glistening, golden-yellow leaflets, m. p. 160.5°; the *sulphate* forms dark blue needles. *Benzeneazo-m-bromobenzylidene-p-hydrazone* crystallises in small, glistening, golden-yellow leaflets, m. p. 173°; the *sulphate* is blue. *Benzeneazo-p-aminobenzylidene-p-hydrazone*, prepared from *p*-aminobenzaldehyde, forms small, reddish-brown leaflets, darkening at 136°, and decomposing above this, the residue being completely melted at 180.5°. *Benzeneazo-p-dimethylaminobenzylidene-p-hydrazone* crystallises in cinnamon-red needles, m. p. 185.5°; the *hydrochloride* forms small, glistening, blue needles. *Benzeneazo-p-hydroxybenzylidene-p-hydrazone* forms dark red needles, m. p. 196°; the *hydrochloride* consists of dark blue needles. *Benzeneazofurfurylidene-p-hydrazone*,

prepared from furfuraldehyde, forms reddish-brown tablets, m. p. 133°; the *hydrochloride* is brownish-black.

Benzeneazobenzophenone-p-hydrazone, $\text{C}_6\text{H}_5\cdot\text{N}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{N}:\text{CPh}_2$, prepared from benzophenone, forms brownish-red leaflets, m. p. 144°; the *hydrochloride* forms blue needles or plates. *Benzeneazobenzil-p-hydrazone*,

prepared from benzil, forms orange-red needles, m. p. 184—185°; the *hydrochloride* is blue. *Benzeneazobenzylidene-p-hydrazone hydrochloride* is a black powder. J. C. C.

Trisbenzeneazophenol. LÉO VIGNON (*Bull. Soc. chim.*, 1908, [iv], 3, 1030—1031).—In previous work (*Abstr.*, 1904, i, 699) on bisbenzeneazophenol, the author obtained indications of the formation of a substance richer in nitrogen, and this has led him to repeat Grandmougin and Freimann's work on trisbenzeneazophenol (*Abstr.*, 1907, i, 664). He confirms their results, but points out that the yield of the trisazo-substance is only 1% of the theoretical.

T. A. H.

Aromatic Tetrazens. V. HEINRICH WIELAND (*Ber.*, 1908, 41, 3498—3506).—The tetrazens are decomposed by hydrogen chloride in a similar manner to the tetra-arylhydrazines:

Thus tetratolyltetrazen yields first a quinonoid salt,

indicated by a violet coloration in solution, which is decomposed with evolution of nitrogen, and finally *p*-ditolylamine, tolazonium and dichlorotolazonium chloride result. Tetra-anisyltetrazen behaves similarly; acetic acid brings about this decomposition in the cold with remarkable ease.

p-Tetratolyltetrazen, $\text{N}(\text{C}_7\text{H}_7)_2 \cdot \text{N} : \text{N} \cdot \text{N}(\text{C}_7\text{H}_7)_2$, prepared by oxidation of *p*-ditolylhydrazine, preferably with permanganate, crystallises in glistening, yellow needles, decomp. 134° . It is decomposed by hydrogen chloride or acetic acid to tolazine derivatives. With bromine, a bluish-violet coloration indicates a primary additive product, which changes to a brownish-green; but little ditolylamine along with much dibromotolazine is formed.

To prepare *p*-dianisylhydrazine, *p*-dianisylamine is converted into the *nitrosoamine*, crystallising in flat, bright yellow needles, m. p. 79° , and dissolving in concentrated sulphuric acid with a greenish-blue coloration. On reduction with zinc dust and acetic acid, the *dianisylhydrazine*, $\text{NH}_2 \cdot \text{N}(\text{C}_6\text{H}_4 \cdot \text{OMe})_2$, is obtained in mother-of-pearl-like, broad pointed, colourless needles, m. p. 111° . The *hydrochloride* is sparingly soluble. The oxidation to *p*-tetra-anisyltetrazen,

could only be effected by means of *p*-benzoquinone. The tetrazen forms citron-yellow, four-sided plates, m. p. 117° (violent decomp.). Decomposition with acids gives the characteristic anisazonium compounds.

Tetratolyltetrazen dissolved in xylene, when heated for a few minutes, shows a violent evolution of nitrogen and formation of tetratolyldiazine. E. F. A.

Catabolism of Proteins. FRANZ HOFMEISTER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 273—281).—This paper is mainly a review of recent work on the cleavage of proteins, and the importance of such work and the necessity of dealing with pure substances are among the points insisted upon. W. D. H.

Effect of Acid and Alkali on the Osmotic Pressure of the Serum Proteins. L. ADAMSON and HERBERT E. ROAF (*Bio-Chem. J.*, 1908, 3, 422—438).—Alkali increases (although not proportionally to the amount added) the osmotic pressure of the serum proteins. Acid causes this pressure to fall to zero, but larger amounts of acid increase it again. The point of zero pressure corresponds with the "alkaline reactivity" of serum ash. When the amount of alkali added is corrected by this "alkaline reactivity," the relationship of the osmotic pressure to the amount of alkali is a logarithmic one. The experiments with alkali are limited by the breaking up of the protein into particles small enough to pass a parchment paper membrane, and with acid by the partial precipitation of the protein. W. D. H.

Dissociation of Solutions of the Basic Caseinates [Caseinogenates] of Sodium and Ammonium. T. BRAILSFORD ROBERTSON (*J. Physical Chem.*, 1908, 12, 473—483).—In a previous paper (*Abstr.*, 1907, i, 1096), it has been shown that the solutions of sodium and ammonium caseinate neutral to litmus obey Ostwald's dilution law for binary electrolytes. Sackur (*Abstr.*, 1903, ii, 4) had previously carried out electrical conductivity measurements with solutions of the corresponding "basic" salts, which were obtained by adding sufficient alkali to make the solutions neutral to phenolphthalein, the amounts of alkali required to produce the basic and neutral solutions being in the ratio 8:5. The author now shows from Sackur's results that the solutions of the basic caseinates also follow the dilution law for binary electrolytes, so that casein appears to behave as a monobasic acid in both solutions. Sackur has suggested that casein behaves to alkalis as a tetrabasic acid, but it is shown that the evidence for this view is untrustworthy.

The above results are best accounted for on the view that complex ions containing casein are present. The neutral caseinates are amphoteric salts of the combined base, containing the ions NaX' and XXOH' ($\text{X} = \text{casein}$), whilst the basic caseinates are true salts of the combined base, the solutions containing the ions Na' and XXOH' . In all the solutions there is an equilibrium of the type $\text{NaX}' + \text{HXOH} \rightleftharpoons \text{Na}' + \text{HXXOH}$, which is not displaced by dilution.

From Sackur's results, the value 15.2×10^{-5} cm./sec. is obtained for the velocity of the casein ion in solutions of basic sodium caseinate, and 9.1×10^{-5} cm./sec. for the velocity of the same ion in solutions of ammonium caseinate.

The dissociation constants for the "basic" sodium and ammonium salts of casein are 0.0499 and 0.0404 respectively. G. S.

Action of Iron and of Heavy Metals [as Oxygen Carriers]. VINCENZO CERVELLO (*Arch. exp. Path. Pharm., Suppl.*, 1908, 107—109).—The oxidation of guaiacum resin is accelerated by the salts of heavy metals, and most of all by those of iron and copper. In the case of ferric salts, a partial reduction to the ferrous state occurs. The part played by iron as a constituent of hæmoglobin is discussed. G. B.

Urochrome. I. HERMANN HOHLWEG (*Biochem. Zeitsch.*, 1908, 13, 199—204).—The pigment was prepared from human urine, which was made alkaline with calcium hydroxide, precipitated with calcium chloride, the filtrate neutralised with acid, and evaporated in a vacuum to a syrup; after separation of the greater part of the salts, the syrup was diluted and shaken for several hours with animal charcoal, which absorbed the pigment, and from which it was afterwards removed by glacial acetic acid. From the solution thus obtained, it was precipitated by ether. The brown powder prepared in this way contained 8.22% of ash, and was soluble in water and methyl alcohol, but insoluble in strong ethyl alcohol and other organic solvents. Its spectrum showed no absorption bands, and it did not give the urobilin reaction with ammoniacal zinc chloride. It gave the

Garrod reaction with acetaldehyde and subsequent treatment with ammoniacal zinc chloride; also the Molisch reaction with α -naphthol.
S. B. S.

Urochrome. II. K. E. SALOMONSEN (*Biochem. Zeitsch.*, 1908, 13, 205—207).—The product was prepared by a slight modification of Hohlweg's method (preceding abstract). It was purified by conversion into its calcium salt. On treatment of an aqueous solution of the pigment with bromine in the cold, a yellow bromo-derivative was obtained, which was soluble in alkalis. On warming an aqueous solution of urochrome with bromine, a more vigorous bromination accompanied by oxidation takes place.
S. B. S.

Urochrome. III. STEFANO MANCINI (*Biochem. Zeitsch.*, 1908, 13, 208—214).—The bromo-derivative of Hohlweg and Salomonsen (preceding abstracts) was prepared by a modified method, unconcentrated urine being employed for the purpose. It was purified by dissolving in alkali, precipitating by acid, dissolving the substance thus obtained in water, and treating again with bromine. The doubly-refracting, yellow product thus prepared, when heated with zinc dust or calcium hydroxide, gives strong pyrrole reactions. Its composition corresponds approximately with the formula $C_{30}H_{41}O_{12}N_7Br_6$, which would be a bromo-derivative of $C_{38}H_{47}O_{12}N_7$. This is not far removed from the formula $C_{36}H_{39}O_{16}N_7$, which Thudichum ascribed to uromelanin. For it the name *uropyrryl* is proposed. By oxidation of crude bromouropyrryl with bromine water, oxalic acid, an oily acid, which gives the pyrrole reaction, and also, most probably, bromoanil were obtained. Neither oxalic acid nor bromoanil were obtained when a product, purified by repeated solution in alkali, re-precipitation with acids, and re-bromination, was employed. The relation of *uropyrryl* to urochrome is not yet ascertained.
S. B. S.

Hippomelanin. I. PETER RONA and O. RIESSER (*Zeitsch. physiol. Chem.*, 1908, 57, 143—153).—Hippomelanin, purified by Fürth and Jerusalem's method (Abstr., 1907, ii, 797), has been oxidised by a 3% solution of hydrogen peroxide containing a small amount (0.002%) of hydrochloric acid in solution. The total nitrogen of the aqueous solution was 7.5%, and the ammoniacal nitrogen 4.2%, that is, 56% of the total nitrogen present in the hippomelanin. Attempts were made to isolate the other nitrogenous products in the form of copper compounds. A copper derivative was obtained which was insoluble in alcohol and water. This contained a small amount of copper oxalate, but no other constituent was obtained in a pure form.

A copper derivative soluble in alcohol and water was also obtained. From this a base, which was precipitated by phosphotungstic acid, was isolated. The *hydrochloride* is readily soluble in water or alcohol. The *picrate* is deposited as an oil sparingly soluble in alcohol; the *picrolonate* is a deep red compound sparingly soluble in water, and the *platinichloride*, $N = 16.14\%$, forms ochre-yellow prisms, m. p. 280° , insoluble in alcohol.
J. J. S.

Inosic Acid. CARL NEUBERG and B. BRAHN (*Ber.*, 1908, 41, 3376—3381. Compare Abstr., 1907, i, 1097).—It is pointed out that the sugar obtained by hydrolysing inosic acid cannot be *r*-arabinose, as stated by Bauer (Abstr., 1907, i, 1098). The authors confirm their view that it is *l*-xylose. They have obtained it in a syrupy form, have shown that it gives the pentose reactions, and that it is dextrorotatory. They further show that it does not yield a diphenylhydrazone as readily as does *r*-arabinose.

Levene and Jacob's conclusion (this vol., i, 931), that in place of a pentose inosic acid yields a tetrose-carboxylic acid, is shown to be untenable. J. J. S.

Glucothionic Acid. JOHN A. MANDEL and CARL NEUBERG (*Biochem. Zeitsch.*, 1908, 13, 142—147. Compare Abstr., 1905, ii, 736).—Preliminary investigations show that the product obtained from the kidneys contains sulphuric acid in a conjugated form. Dextrose is not a product of hydrolysis, and neither is the substance of polysulphide nature. For these reasons, the name glucothionic acid is inapplicable. Names indicating the origin of the product are suggested, for example, *renosulphuric acid*. S. B. S.

Jecorin and other Lecithin-like Substances in the Liver of the Horse. A. BASKOFF (*Zeitsch. physiol. Chem.*, 1908, 57, 395—460).

Jecorin was prepared so that it gave a constant N:P ratio and a constant yield of sugar (about 14%). It is a diamino-monophosphatide in Erlandsen's sense.

The alcoholic extract of the liver is evaporated to a syrupy consistency, and treated with ether; a jecorin-like substance forms as a heavy layer at the bottom of the vessel; there is also a brown precipitate, insoluble in ether and alcohol, which was not further investigated. The addition of alcohol to the ether extract produces a precipitate of crude jecorin, lecithin remaining in solution. The precipitate is again treated with ether, and a jecorin-like substance remains insoluble; the extract, however, contains Drechsel's jecorin, which is precipitable by alcohol, and can be purified by the repetition of this process three or four times. W. D. H.

Glutamic Acid in Various Keratins. EMIL AUERHAIDEN and BENES FUCHS (*Zeitsch. physiol. Chem.*, 1908, 57, 339—341).—The following table gives the mean analytical results obtained, in parts %:

	Hoof of ox.		Horn of ox.		Hoof of horse.
	1 yr. old.	4 yrs. old.	1 yr. old.	4 yrs. old.	
Dry residue	90.5	91.5	96.0	96.5	75.4
N	0.14	0.16	0.22	0.36	0.45
Melanin substances	0.22	0.12	1.65	0.96	0.9
Glutamic acid hydrochloride in ash-free dry residue.....	18.0	16.8	13.8	12.9	18.2

Attention is called to the variable numbers obtained, and to the fall of glutamic acid and rise of ash with increasing age. W. D. H.

The Composition of the Protamine from Salmon Spermatozoa. LOUIS NELSON (*Arch. exp. Path. Pharm.*, 1908, 59, 331—335).—The protamine was prepared by Schmiedeberg's method, and converted into the platinichloride. It was found that an impurity could be removed from the latter by hot water. The protamine was found then to have a composition corresponding with the formula $C_{16}H_{27}O_5N_7$.
S. B. S.

Chemistry of Protamines. I. Protamine from the Spermatozoa of the Caspian Sturgeon, *Accipenser Guldenstadti*. W. D. MALENÜCK (*Zeitsch. physiol. Chem.*, 1908, 57, 99—112. Compare Kuračeff, Abstr., 1901, ii, 462).—For isolating protamines and determining the yield, the method of precipitating with sodium picrate is preferred to Kossel's method of repeated solution of the sulphate in water and precipitation with alcohol. The sulphuric acid extract is stirred continuously with the aqueous picrate solution until a flocculent, orange-yellow precipitate is formed. The filtrate should be clear and free from opalescence, and should yield a further precipitate with sodium picrate. The precipitated picrate is washed, dried, dissolved in acetone, and decomposed with sulphuric acid. A portion of the picrate is insoluble in acetone, and this is shown to consist of adenine picrate, whereas the protamine picrate is readily soluble. In decomposing the acetone solution of the picrate, it is essential that an excess of sulphuric acid is not added.

The last traces of picric acid can be removed by solution in water, evaporating the solution, carefully precipitating with alcohol and acetone, and rubbing the sticky mass in a mortar with acetone until hard. The dry sulphate prepared by such a method usually contains only 0.3% of ash when dried at 108—110°, and gave the following analytical results: C, 37.64; H, 6.61; N, 20.92, and H_2SO_4 22.59%. Similar data were obtained with a sulphate which had been converted into the chloride by Goto's method. The formula $C_{27}H_{55}O_7N_{13} \cdot 2H_2SO_4$ agrees best with these data.
J. J. S.

Thymamine, a Protamine from the Thymus Gland. LOUIS NELSON (*Arch. exp. Path. Pharm.*, 1908, 59, 336—340).—The protamine was prepared by extracting the coagulated proteins of the gland with copper chloride solution by Schmiedeberg's method, by means of which a solution of the hydrochloride is obtained. Sodium hydroxide is added until the reaction is neutral, and the filtrate from the precipitate thus produced evaporated, when copper protein combinations separate. The filtrate from these is diluted and evaporated, and more protein separates and is filtered off. These processes are repeated until a solution which no longer gives a reaction with Millon's reagent is obtained. The protamine is prepared from this by precipitating as phosphotungstate, and is finally obtained in the form of a platinichloride, the purification of which is described in detail. Its composition corresponds with the formula $C_{22}H_{40}O_5N_6$.
S. B. S.

The Action of Tyrosinase from *Russula delica* on Polypeptides which contain Tyrosine and on Suprarenine. EMIL ABDEKHALDEN and MARKUS GUGGENHEIM (*Zeitsch. physiol. Chem.*, 1908, 57,

329—331. Compare this vol., i, 237).—In addition to the peptides previously used, tyrosinase rapidly splits *d*-alanyl-*L*-tyrosine and *L*-leucyl-*L*-tyrosine. It also decomposes suprarenine (adrenaline), with the rapid formation of a red colour, and later of dark-coloured flocculi; *L*-, *d*-, and *DL*-suprarenines are all decomposed with equal rapidity.

W. D. H.

Milk Proteins and Enzymes. GEORGE A. OLSON (*J. Biol. Chem.*, 1908, 5, 261—282).—After removal of the caseinogen and albumin, milk, cream, and butter are stated to yield a new protein, which is precipitable by hydrochloric acid. It contains 18.9% of nitrogen. When it is added to milk, it produces partial digestion of the caseinogen; this power is most active at 65°, and is destroyed at 80°. After removal of the new protein, the filtrate also has the same property; the ferment action of the protein is therefore believed to be due to incorporation.

W. D. H.

The Scission by Diastase of Lactose, Maltose, and their Derivatives. H. BIERRY and J. GIAJA (*Compt. rend.*, 1908, 147, 268—270).—The lactone of lactobionic acid was treated with macerations of foetal intestines (sheep and oxen) and with digestive juices of snails. The former was inactive, whereas the latter caused the production of galactose; it also acts on lactosazone with the production of galactose. Similar results were obtained with the lactone of maltobionic acid. These facts afford further evidence of the specific nature of the ferments.

S. B. S.

Action of Organo-magnesium Compounds on Arsenious Oxide. FRANZ SACHS and HANS KANTOROWICZ (*Ber.*, 1908, 41, 1767—1769).—The addition of powdered arsenious oxide to an ethereal solution of magnesium phenyl bromide leads to the formation of diphenylarsine oxide after thirty minutes' heating, and of triphenylarsine after three hours. With magnesium *p*-tolyl bromide, only tri-*p*-tolylarsine is obtained, whilst with magnesium benzyl bromide, after three hours' heating, a substance, $\text{As}(\text{CH}_2\text{Ph})_2 \cdot \text{OH} \cdot \text{H}_2\text{O}$, m. p. 15—216°, is formed after the usual operations.

C. S.

Triphenylstibine Sulphide. LUDWIG KAUFMANN (*Ber.*, 1908, 41, 762—2766).—Contrary to the statement of Michaelis and Rees (*Abstr.*, 1886, 884), triphenylstibine sulphide can be prepared under the following conditions: Pfeiffer's triphenylstibine (*Abstr.*, 1905, i, 64) is converted into a haloid additive compound, preferably the iodide, which is dissolved in alcoholic ammonia, and hydrogen sulphide passed through the solution until a faint yellow coloration appears in the liquid; the crystals which have separated are recrystallised from alcohol, whereby colourless triphenylstibine sulphide, SbPh_3S , is obtained, m. p. 119—120°. Prolonged heating of its solutions or treatment with acids, even acetic, causes decomposition into sulphur and triphenylstibine.

If, during the preparation, the current of hydrogen sulphide is continued, the crystals redissolve to a yellowish-red solution, which

probably contains a very labile antimony compound, for, by keeping, the liquid deposits sulphur, and the colourless filtrate, which is free from sulphur, yields pure triphenylstibine by evaporation. C. S.

Action of Grignard Reagents on Ethyl Orthosilicate.

EUGEN KHOTINSKY and BASILE SEREGENKOFF (*Ber.*, 1908, 41, 2946—2953).—When ethyl orthosilicate, dissolved in dry ether, is added gradually to a cold ethereal solution of a Grignard reagent, the mixture heated for ten to fifteen minutes on the water-bath, and decomposed by 50% acetic acid, compounds are obtained of the type $R \cdot Si(OEt)_2$. Only one ethoxyl group can be replaced (compare Tschitschibabin, *Abstr.*, 1905, i, 283). If the heating is prolonged, or if excess of the Grignard reagent is used, complex silicon compounds are formed. In order to prevent the presence of any trace of moisture, the reaction is carried out in a current of dry hydrogen.

Ethyl orthosilicobenzoate, $SiPh(OEt)_3$, b. p. 232—234°, has been prepared by Ladenburg (*Annalen*, 1874, 173, 151); it is hydrolysed by cold hydriodic acid, D 1.7, yielding Ladenburg's silicobenzoic acid, $C_6H_5 \cdot SiO_2H$, m. p. 92°, which is also obtained when the reaction product of an excess of magnesium phenyl bromide and ethyl orthosilicate (1 mol.) is decomposed by sulphuric acid. By prolonged heating of the mixture before decomposition by sulphuric acid, trisilicobenzoysilicic acid, $OH \cdot Si(O \cdot SiPhO)_3$, is obtained, which is also found in the high-boiling residue in the preparation of the ortho-ester; it appears to be identical with Polis' compound (*Abstr.*, 1886, 618). Ethyl ortho-2:4-dimethylsilicobenzoate, $C_6H_3Me_2 \cdot Si(OEt)_3$, b. p. 268—271°, obtained in a similar manner from magnesium *m*-xylyl iodide, yields, by hydrolysis, the acid, $C_6H_3Me_2 \cdot SiO_2H$, m. p. 118—121°. The residue in the distillation of the ester contains trisilico-xylylsilicic acid, $Si(O \cdot SiO \cdot C_6H_3Me_2)_3 \cdot OH$, an infusible, non-volatile, greyish-white powder.

Ethyl α -orthosiliconaphthoate, $C_{10}H_7 \cdot Si(OEt)_3$, has b. p. 293—295°, and yields, by hydrolysis with cold hydriodic acid, α -siliconaphthoic acid, $C_{10}H_7 \cdot SiO_2H$, m. p. 239°, softening at 225°, and, by hydrolysis with cold concentrated sulphuric acid, a sulpho- α -siliconaphthoic acid, $SO_3H \cdot C_{10}H_7 \cdot SiO_2H$, m. p. 88—90°. Ethyl β -orthosiliconaphthoate, $C_{10}H_7 \cdot Si(OEt)_3$, has b. p. 270—273°, and the acid, $C_{10}H_7 \cdot SiO_2H$, m. p. 248—250°. C. S.

A Zirconium Mercury Double Salt. WALTER PETERS (*Ber.*, 1908, 41, 3173—3175).—Although zirconium tetrachloride and mercury phenyl may be heated in a closed tube or under a pressure of 1 mm. without undergoing change, interaction takes place if the tube is evacuated by a water pump, owing to the presence of water vapour. The white, hygroscopic needles of the salt, $ZrOCl_2 \cdot 2HgClPh$, are soluble in ether, and, when submitted to vacuum distillation at 170—210°, give a sublimate of mercury phenyl chloride and a residue of the composition $Zr_3O_4Cl_4 \cdot 6HgClPh$. Mercury ethyl and mercury *o*-tolyl are without action. W. R.

General and Physical Chemistry.

Ultraviolet Spectrum of Silicon. ANTOINE DE GRAMONT and CHARLES DE WATTEVILLE (*Compt. rend.*, 1908, 147, 239—242).—The ultraviolet spectrum of silicon containing both lines and bands has been mapped between $\lambda 2123.0$ and $\lambda 2987.8$. The spectrum of the oscillating spark passing between silicon poles in hydrogen in a quartz tube gave 23 lines and 14 bands, whereas the flame spectrum obtained by burning ordinary gas impregnated with silicon chloride vapour contained 26 bands and 11 lines. The relative intensities of lines and bands common to both spectra were not the same.

The oscillation frequencies of the bands seem to fall into series, but the heads are ill-defined. R. J. C.

Dispersion in the Electric Spectra of Benzene, Toluene, and Acetone. A. R. COLLEY (*J. Russ. Phys. Chem. Soc.*, 1908, 40 [*Phys.*], 228—244).—The author has investigated the electrical spectra of benzene, toluene, and acetone, a method being used which permits of accurate measurements with small troughs in the case of liquids with low refractive indices. The results, which are given in the form of tables and curves, bring out the intimate chemical relationship between toluene and benzene, two bands being common to the two spectra. Further, the spectra of toluene and acetone also exhibit one common band, which must be regarded as typical for the methyl group. T. H. P.

Discontinuous Cathode Luminescence Spectra of Some Aromatic Compounds. OTTO FISCHER (*Zeitsch. wiss. Photograph. Photochem.*, 1908, 6, 305—326. Compare Goldstein, *Abstr.*, 1904, ii, 689, 690).—The emission spectra of the substances exposed to cathode rays at the temperature of solid carbon dioxide were photographed. Difficulties were found in certain cases, owing to the rapid change of colour of some substances under the influence of cathode rays. The ultraviolet spectra were not examined.

The number of luminous bands is with most aromatic substances considerable. In all the cases examined, the sharp edges of the bands are turned towards the red, the blue side being more or less indistinct. It is frequently possible to group the bands in series, corresponding pairs of which show a constant difference of wave-length.

In the case of naphthalene compounds, blue and violet light is only emitted for a short time, the colour changing to yellow or red. Three characteristic blue bands of naphthalene reappear in the spectra of all the naphthalene derivatives examined, and also in those of diphenyl and phenanthrene, but, whilst the last two compounds continue to emit these bands, the structure producing them is rapidly destroyed by the bombardment in the case of naphthalene derivatives. The same

bands appear, strongly shifted towards the red, in anthracene and dibromoanthracene.

C. H. D.

Influence of Temperature and of the State of Aggregation on the Absorption Spectra of Molten Salts. T. RETSCHINSKY (*Ann. Physik*, 1908, [iv], 27, 100—112).—An examination of the absorption spectra of some thirty molten inorganic salts has shown that, in all cases, there is a well-defined limit to the absorption band on the ultra-violet side of the spectrum, all radiations of smaller wave-length than that corresponding with the limiting value being completely absorbed. With rise of temperature, this limit is displaced in the direction of greater wave-lengths. When the displacement is expressed in terms of wave-lengths, its magnitude, for a given rise of temperature, increases with the wave-length; when expressed in terms of frequencies, the displacement is independent of the wave-length. For a temperature rise of 100° , the absorption limit is displaced to an extent represented by 10 to $20 \times 10^3/\mu\mu$.

Some of the salts have been also investigated in the solid state. The influence of temperature on the absorption limit is of the same order of magnitude as in the case of the molten substances. On liquefaction, the absorption limit is displaced considerably in the case of the chlorides and bromides of potassium and sodium, but no sharp change is met with in the case of silver nitrate, silver chloride, or lead chloride.

In regard to the influence of chemical composition on the absorption, it is found that the salts of the heavy metals absorb more than those of the alkali and alkaline-earth metals. In general, for a given metal the sulphate absorbs most light; then follow the chloride, bromide, iodide, and nitrate with gradually decreasing absorptions. For salts of the same acid containing metals belonging to the same group of the periodic system, the absorption limit is nearer the red end of the spectrum the greater the atomic weight of the metal.

H. M. D.

Fluorescence of Sodium Vapour. HANS ZICKENDRANT (*Physikal. Zeitsch.*, 1908, 9, 593—603).—The thermal and electrical condition of fluorescing sodium vapour has been examined. In contact with air, fluorescence begins at 280 — 290° ; this temperature is independent of the pressure, although the sharpness with which the phenomenon sets in is much greater at higher pressures than at low. Measurements have been made of the minimum potential required for electrical discharge through the vapour under different conditions. For sodium vapour in contact with air, the potential temperature curves show minima at 240° and 280° ; the latter is supposed to correspond with the commencement of fluorescence. In contact with nitrogen and carbon dioxide, the minimum potential differences corresponding with this are 300° and 340° respectively. In contact with hydrogen, an olive-coloured fluorescence can be observed at 370° , but no current could be passed through the vapour with the available potential of 400 volts.

The properties of the vapour in contact with air have been examined in greater detail. Curves are plotted which show the dependence of the current on the discharge potential under different pressures, and also the dependence of the potential on the pressure and on the temperature for a given current intensity. When a current has been passed through the vapour for some time, a smaller potential is required for discharge immediately after the cessation of the current than when some time has elapsed. The potential gradually increases, and attains a constant value after some minutes. The paper concludes with a theoretical discussion of the cause of the conducting power of sodium vapour.

H. M. D.

Fluorescence of Organic Substances. JOHANNES STARK and W. STEUBING (*Physikal. Zeitsch.*, 1908, 9, 661—669. Compare Abstr., 1907, ii, 147, 417; this vol., ii, 138, 746).—Further observations relating to the fluorescence of substances containing chromophoric groups are communicated, and a summary is given of the results obtained in the series of papers published by Stark on the connexion between fluorescence and absorption.

The new substances examined were acetone, methyl ethyl ketone, pyrotartaric acid, phorone, diacetyl, camphor, camphorquinone, methylfulven, potassium azodicarboxylate, azodicarbonamide, diethylketen, and diphenylketen. From the observations, the conclusion is drawn that if a substance possesses two absorption bands, one in the region of longer wave-lengths, the other in the remote ultraviolet region, it will fluoresce in the region of the first band when light is absorbed in the region of the second. The fact that the maxima of the intensity of the fluorescence and absorption do not coincide is due to the absorption which the fluorescent light undergoes in its passage through the absorbing medium. The two azo-compounds investigated are exceptions to this general statement, but this is supposed to be due to the absence of the radiation of the requisite very short wave-lengths from the aluminium light used in the experiments.

H. M. D.

Ultraviolet Fluorescence of Cyclic Compounds. HEINRICH RY and K. VON ENGELHARDT (*Ber.*, 1908, 41, 2988—2995. Compare Stark, Abstr., 1907, ii, 147; Stark and Meyer, *ibid.*, ii, 418).—The ultraviolet fluorescent, and the absorption, spectra of mono- and substituted benzene derivatives in ethyl-alcoholic solutions of 0.005 concentration have been measured in an apparatus very similar to that used by Stark; the results confirm this investigator's theory of the relation between fluorescence and selective absorption.

Toluene and propylbenzene are more strongly fluorescent than benzene, and the four bands which characterise the fluorescent spectrum of benzene have disappeared in the spectra of these two homologues. The auxochromic influence of the amino-group is accompanied by an auxofluoric influence, since aniline is more fluorescent than benzene; dimethylaniline, however, is less fluorescent than aniline, although the contrary might be expected from Kauffmann's

view that the dimethylamino-group is a stronger auxochrome than the amino-group. The hydroxyl and the methoxyl groups also act as auxochromes, phenol and anisole exhibiting a remarkably strong fluorescence, whilst the very feeble fluorescence of benzoic acid is markedly increased in the hydroxybenzoic acids, of which the ortho-compound fluoresces most strongly, even in the visible region, as is evident to the naked eye, when a quartz lamp and a quartz vessel are used. Although anisole is more fluorescent than phenol, the methoxybenzoic acids are less so than the hydroxy-acids; the fluorescence of *p*-methoxybenzoic acid cannot be detected with certainty. The introduction of a halogen into the benzene nucleus diminishes the fluorescence, the more so the greater the molecular weight; iodo-benzene does not fluoresce. Benzonitrile is remarkably fluorescent. Benzamide is non-fluorescent, showing that the amino-group only has auxochromic influence when situated in the nucleus.

The presence of a nitro-group often entirely prevents fluorescence even although *o*- and *p*-nitrophenols and *o*-nitroaniline exhibit marked selective absorption (according to Stark's theory, fluorescence is conditioned by the presence of bands in the absorption spectrum). The non-fluorescence may be attributable to quinonoid structure (compare Baly, Edwards, and Stewart, *Trans.*, 1906, 89, 514 Hantzsch, *Abstr.*, 1906, i, 353), since simple quinones never fluoresce. Neither pyridine nor ethyl collidinedicarboxylate exhibit fluorescence. Ethyl dihydrocollidinedicarboxylate, however, shows violet fluorescence in alcoholic solution, and also a very intense band; thus providing a good confirmation of Stark's theory. C. S.

Natural and Magnetic Rotation of the Plane of Polarisation in Crystals. WALDEMAR VOIGT and K. HONDA (*Physikal. Zeitsch.* 1908, 9, 585-590).—Measurements of the natural rotation of the plane of polarisation for a series of wave-lengths are recorded for *d*- and *l*-sodium chlorate and *d*-tartaric acid in the direction of the optic axis, and for sucrose in the direction of the two axes. The rotation induced by a strong magnetic field was measured for sodium chlorate, dolomite, apophyllite, apatite, and sucrose. In the case of sucrose, the values obtained for the two optic axes indicate that the magnitude of the rotation of the plane of polarisation is different in the two directions. H. M. D.

Relation between Rotatory Power and Chemical Constitution. II. D. HARDIN (*J. Chim. Phys.*, 1908, 6, 584-591. Compare this vol., ii, 470).—The theoretical deductions given in the previous paper have been further tested by application to certain derivatives of hexyl alcohol.

The atomic product for oxygen (the product of the distance between the oxygen and carbon atoms and the atomic weight of the former element) is approximately the same as that calculated from observation on the amyl derivatives, but is of opposite sign. The difference of sign has not been satisfactorily accounted for.

The theory also indicates that the distance between the centre of gravity of the benzene ring and the first carbon in the side-chain will be different according as the bonds between carbon and hydrogen are in the plane of the ring or perpendicular to it. The experimental data obtained with hexylbenzene support the latter view as to the structure of the benzene nucleus.

Active hexyl alcohol (γ -methylamyl alcohol) was prepared by saponification of Roman camomile oil with cold concentrated potassium hydroxide solution and repeated fractionation. The fraction boiling at 151—152°/758 mm. has D^{20}_D 0.8262, $[\alpha]^{20}_D$ + 8.77°, D^{30}_D 0.7812, $[\alpha]^{30}_D$ 7.53°, and D^{47}_D 0.7276, $[\alpha]^{47}_D$ 6.10°. The corresponding *bromide* has D^{19}_D 1.1852, $[\alpha]^{19}_D$ + 19.97°, D^{27}_D 1.1150, $[\alpha]^{27}_D$ 17.12°, and D^{42}_D 1.0319, $[\alpha]^{42}_D$ 13.97°. Active hexylbenzene (α -phenyl- γ -methylpentane) (compare Klages and Sautter, Abstr., 1904, i, 302), prepared by the action of sodium on a mixture of bromobenzene and hexyl bromide, has D^{19}_D 0.8521, $[\alpha]^{19}_D$ + 16.62°, D^{28}_D 0.7873, $[\alpha]^{28}_D$ 14.99°, and D^{38}_D 0.7396, $[\alpha]^{38}_D$ 13.66°.

G. S.

Optical Isomerides. I. IWAN OSTROMISLENSKY (*Ber.*, 1908, 41, 3035—3046).—The observations of Gernez on the separation of a *dl*-conglomerate by means of the addition of a fragment of a substance isomorphous with one of the components have been extended.

The addition of *l*-asparagine to a supersaturated solution of *dl*-sodium ammonium tartrate causes the deposition of the pure *d*-tartrate.

Both *d*-tartrate and *l*-asparagine are hemihedral forms belonging to the rhombic system, and are isomorphous.

An optically active salt can also be obtained by impregnating a supersaturated solution of *dl*-sodium ammonium tartrate with a crystal of an active modification of any other alkali tartrate; for example, Rochelle salt, potassium tartrate, sodium tartrate, potassium hydrogen tartrate. In all cases the salt which is deposited is dextrorotatory if the impregnating material is dextro, and laevo if this is laevorotatory. Inoculation with ordinary ammonium malate causes the deposition of *d*-sodium ammonium tartrate. Substances which are isodimorphous with the sodium ammonium tartrate can also be used for bringing about the separation. Thus a crystal of *d*-potassium ammonium tartrate (usually monoclinic) causes the deposition of *d*-sodium ammonium tartrate, and similarly with potassium tartrate.

It is not necessary that the material used for inoculation should be optically active; thus glycine added to a supersaturated solution of *dl*-asparagine causes the deposition of either *d*- or *l*-asparagine, and it is not possible in any given experiment to predict which of the two will separate from an inspection of the glycine crystals, although the same glycine crystal always acts in the same way. The conclusion is drawn that glycine belongs to the hemihedral class of rhombic prisms.

This method of deposition is suggested as a method for determining whether the given substance is a *dl*-conglomerate or a *r*-compound.

If the crystals deposited on impregnating with an isomorphous substance are found to be inactive, then the original solution contained

a racemic compound, but if active, then the original was an inactive conglomerate. J. J. S.

Chemical Action of Light. GIACOMO L. CIAMICIAN (*Bull. Soc. chim.*, 1908, [iv], 3, i—xxvii).—A lecture delivered before the French Chemical Society. E. H.

Chemical Action of Tropical Sunlight. GILBERT JOHN FOWLER (*Mem. Manchester Phil. Soc.*, 1908, 52, xiv, 1—20).—Observations are recorded on the rate of liberation of iodine from an acidified potassium iodide solution under the influence of light. The reaction is practically unaffected by temperature under the ordinary conditions of exposure. The rate of liberation of iodine from a given solution diminishes with the duration of the exposure; this is due to the absorption of the chemically-active rays by the iodine liberated previously. The initial rate of liberation diminishes with increasing dilution of the solution, but, on longer exposure, results in closer agreement are obtained, owing, no doubt, to the greater retarding effect of the iodine liberated from the stronger solutions.

Tables of data obtained by measurements made in Calcutta and on the Mediterranean and Arabian Seas are recorded. The highest record corresponds with an actinic effect which is forty-two times as great as the lowest record obtained on a bright December day in Manchester. No relationship appears to exist between the photochemical and the sun-stroke effect of sunlight.

Solutions of bleaching powder lose their available chlorine with great rapidity on exposure to tropical sunlight. The effect is much more marked in the case of dilute solutions than it is in strong solutions.

Silver chloride, sealed in a glass tube and darkened by exposure to light, becomes quite white again when kept for some time in the dark. In the presence of a globule of mercury, the original colour is not restored. These observations support the view that the darkening of silver chloride on exposure to light is a dissociation effect, and is not due to the formation of an oxychloride. H. M. D.

Photochemical Reactions. III. Decomposition of Ozone by Light. FRITZ WEIGERT (*Zeitsch. Electrochem.*, 1908, 14, 591—597).—The decomposition of ozone by light in presence of chlorine (this vol., ii, 5) is studied quantitatively. The light of a mercury quartz lamp is used, and the rate of decomposition measured by means of the change of pressure of the gas. There is no induction period, and decomposition stops when the light is cut off. The rate of decomposition is independent of the concentration of the ozone; it increases with the concentration of the chlorine, but not in proportion to it, and it is nearly proportional to the intensity of the light. By placing a vessel containing chlorine between the source of light and the ozone tube, a measurement of the quantity of light absorbed by the chlorine is obtained; in this way it is shown that the rate of decomposition of the ozone is proportional to the quantity of light absorbed by the chlorine mixed with it. A rise of temperature of 10° increases the rate of reaction 1.17 times

It is suggested that the light produces some intermediate product which is destroyed rapidly by the action of ozone; the rate of decomposition measured is then the rate of formation of this product, which is independent of the concentration of the ozone. T. E.

Catalytic Reactions and Photochemical Equilibria. BARTOLO L. VANZETTI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 285—288).—The author has carried out experiments to ascertain whether catalytic action necessitates immediate contact of the catalyst and the substance acted on, or whether the action can take place at a distance. When detonating gas is separated from platinum-black by a sheet of glass, the thickness of which is of the same order of magnitude as the wavelength of light, no combination occurs between the hydrogen and oxygen. But when the separating layer consists of an organic material, such as gelatin or a colloid, the hydrogen and oxygen combine slowly, but combination is found to be preceded by diffusion of the mixed gases through the membrane, as is shown by the observation that the diminution of the gas volume per unit of time is proportional to the concentration (pressure) of the gas mixture (compare Ernst, *Abstr.*, 1901, ii, 495).

Experiments with platinum and platinum-black placed at a distance of 0.5—1 mm. from rapid bromide plates show that both these substances exert a negative action on the plate, that is, they take away the darkening produced in the sensitive emulsion by the action of light (compare Piltchikow, *Abstr.*, 1906, ii, 414). This action is, however, quite different from that of light, and from the Russel effect produced by certain metals, in that it is only manifested at the surface of the photographic film and penetrates the latter only very slowly. This negative effect of platinum is especially marked in moist air, is greatly diminished in a cathode-ray vacuum, and is not exhibited in air in presence of phosphoric oxide. Experiments with other metals show that these may be arranged in the following series, in the first part of which the metals exhibit a diminishing positive effect on a photographic plate, whilst in the latter part an increasing negative effect is produced: cadmium, zinc, aluminium, lead, iron . . . copper, tin, silver, palladium, iridium, nickel, gold, platinum. If the condition in a silver bromide plate is represented as an equilibrium between the two reactions $3\text{AgBr} \rightleftharpoons \text{Ag}_2\text{Br} + \text{AgBr}_2$, the upper of which is produced by the action of light, and the lower by the action of darkness, the action of platinum at a distance is to accelerate the latter change. T. H. P.

Chemical Changes Produced by Different Kinds of Rays.
I. **Catalytical Reactions of Sunlight.** CARL NEUBERG (*Biochem. Zeitsch.*, 1908, 18, 305—320).—A large number of substances undergo chemical change when exposed in solution to sunlight in the presence of uranium salts. The following changes have been observed: Alcohols to aldehydes; poly-alcohols to hydroxy-aldehydes or ketones; acids to aldehydes or keto-compounds, sometimes with fewer carbon atoms than the original substance; monosaccharides to osones; disaccharides undergo inversion; polysaccharides and glucosides are

hydrolysed; amino-acids undergo deamidisation and lose carbon dioxide, yielding aldehydes with a smaller number of carbon atoms than the original substance; glycerides are partly hydrolysed; peptones and proteins are partly hydrolysed, and the hydrolysis products undergo the fuller changes noted above.

Amongst the products actually isolated by decomposition in sunlight in presence of uranium salts were: glycerose in the form of the osazone, m. p. 130—131°, from glycerol; glyoxal in the form of the *p*-nitrophenylosazone from tartaric acid; acetaldehyde (in the form of the *p*-nitrophenylhydrazone) from alanine, from which ammonia was also obtained; dextrose (in the form of the osazone) from inulin.

S. R. S.

Theory of Coloured Salts. HERMANN FECHT (*Ber.*, 1908, 41, 2983—2987).—The depth of the colour of many aromatic additive compounds appears to be conditioned by the magnitude of the difference of the electrical character of the two components; the more positive the one and the more negative the other, the deeper the colour. For example, quinone + phenol is red, quinone + sodium phenoxide is blue, and quinone + aniline in cold carbon disulphide yields a mass of dark violet crystals, which becomes colourless when the aniline is washed away. Again, diphenyldi-imine + benzidine gives a yellow solution, which becomes blue when the quinonoid component is made more negative by salt formation; the blue colour vanishes when the other component also enters into salt formation. Malachite-green becomes blue when chlorine is introduced into the phenyl group, and yellow when the halogen is attached to the still basic nitrogen atom. The effect on colour of the halogen atom or the hydroxyl or amino-group is not due to the influence of these *per se*, but depends on whether they increase or diminish the difference in the positive and negative characters of the components of the coloured substance.

When chlorine is passed into a solution of di-iododiphenyl in chloroform, yellow crystals of the *dichloride*, $C_{12}H_8I_2Cl_2$, m. p. 146° (decomp.), are obtained. By heating the dichloride with benzidine in chloroform or carbon disulphide, a *substance*, $C_{24}H_{20}N_2Cl_2I_2$, is obtained in the form of a violet-blue powder, which sublimates and decomposes at 300°.

Equal molecular quantities of quinone and benzidine in chloroform yield a mass of bluish-violet needles with a red, metallic lustre, which melt indefinitely at 118°, resolidify, and decompose above 200°.

The reaction between methyl glutarate and excess of magnesium phenyl bromide in ether leads to the formation of the *ketone*,

m. p. 176°, which forms colourless crystals, and develops a bluish-green coloration with concentrated sulphuric acid. If the Grignard reagent is not in excess, the product of the reaction is the *ester*,

m. p. 120°.

C. S.

Rate of Decay of the Excited Radioactivity from the Atmosphere in Sydney. S. G. LUSBY and T. EWING (*J. Roy. Soc. New South Wales*, 1906, 40 158—160).—A copper wire, 10 metres

long, kept negatively charged at a potential of 25,000 volts, was after three hours' exposure rubbed with cotton wool moistened with ammonia. The cotton wool was incinerated, and the ashes tested for radioactivity; the time taken for the activity to fall to half value was on four days in December, 1905, found to be 41.5, 40.7, 41.9, and 39.5 minutes.

P. H.

Radioactivity of the Rocks in the Region Traversed by the Line to the Simplon. GINO GALLO (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 209—214).—The author has examined the radioactivity of various rocks excavated in the laying of the railway line to the Simplon. The limestone-gypsums and the rocks of the calcareous schist zone are either quite inactive or very feebly radioactive. With the orthogneisses, however, the chemical composition and coefficient of acidity of which indicate that they belong to the eruptive granitic magmas, moderately intense radioactivity is observed, the maximum value found being 43.2 volt-hours. The radioactivity is, in general, accompanied by the presence of certain minerals, such as titanite and zirconia. The pyrites minerals are also moderately radioactive, but the radioactivity cannot be definitely attributed to the metallic sulphides, and not to the gneissic gangue accompanying them. Borne (*Jahrb. Radioaktiv. Elektronik*, 1905) has shown that, of the springs issuing from these rocks, those which are richest in emanation have their origin in the gneiss or in the granitic rocks.

T. H. P.

Preliminary Observations on Radioactivity and the Occurrence of Radium in Australian Minerals. D. MAWSON and T. H. LABY (*J. Roy. Soc., New South Wales*, 1905, 38, 382—389).—A number of Australian minerals were examined for radioactivity by the ionisation produced in an air gap, the activity being compared with that of black oxide of uranium. Radium was tested for, and found in the case of two Australian minerals, but a gadolinite known to contain helium gave no radium emanation.

P. H.

Preparation of Radium from Pitchblende. HEINRICH PAWECK (*Zeitsch. Elektrochem.*, 1908, 14, 619—623).—A description of the process of manufacture of radium salts used at the radium works of the Austrian Government at St. Joachimsthal. The ores of Joachimsthal have been worked since 1518, first for silver, then for cobalt, nickel, arsenic, and bismuth, and more recently for uranium. In 1907 the extraction of radium from the residues from the uranium ore was begun. The raw ore is ground and washed to remove the lighter rock constituents, it is then roasted at 800° to remove sulphur, and finally heated again with sodium carbonate. Uranium, arsenic, antimony, tungsten, molybdenum, and vanadium are washed out in the form of sodium salts. From the residue, iron, aluminium, calcium, silicon, and lead are removed by boiling with sodium hydroxide and then with hydrochloric acid, very thorough washing following each operation. The residue contains barium and radium sulphates, which are converted into carbonates by repeated treatment with sodium carbonate and thorough washing, and then dissolved in hydrochloric

acid and reprecipitated by sulphuric acid. This treatment is repeated several times. The solution of the chlorides is finally evaporated to dryness, and extracted with concentrated hydrochloric acid, which leaves a residue consisting mainly of barium and radium chlorides, which is submitted to fractional crystallisation. Of the radioactivity of the original ore, 73.9% is found in the residue from the uranium extraction, and the remainder in the solid uranium salts produced; there is no loss in waste products.

T. R.

Quantitative Estimation of Radium Emanation in the Atmosphere. GEORGE C. ASHMAN (*Amer. J. Sci.*, 1908, [iv], 26, 119—120).—The author has determined the radioactivity of 200 litres of Chicago air taken from the ground level. The purified air was passed through a long copper spiral immersed in liquid air to condense the emanation, which was afterwards volatilised into an electro-scope and estimated. Precisely the same results were obtained in simultaneous estimations by this method, which is considered to be the best hitherto devised for the purpose.

The radium equivalent of the emanation per cubic metre of air was found to be 86, 58, and 45×10^{-12} gram in three experiments. Immediately after a thaw and heavy rain, the amount rose to 200×10^{-12} gram; under normal weather conditions with high barometer, the value 51×10^{-12} was found, whilst with a low barometer the amount was 131×10^{-12} .

The mean value, the equivalent of 1.0×10^{-10} gram of radium per cubic metre is 25% higher than the amount given by Eve. If the emanation has an appreciable vapour pressure at the temperature of liquid air, even the present estimate must be somewhat too low.

The active material had a half-period of decay of 3.5 days, indicating that it consisted only of radium emanation and that thorium emanation was absent.

R. J. C.

Amount of Radium Emanation in the Atmosphere. JOHN SATTERLY (*Phil. Mag.*, 1908, [vi], 16, 584—615).—The amount of radium emanation present in the atmosphere of Cambridge has been measured by two methods. In the first, the emanation in a known volume of air was absorbed by charcoal; in the second, it was condensed by means of liquid air. The electrical conductivity imparted to a given volume of air by the absorbed or condensed emanation was then compared with the conducting power brought about by the emanation emitted from a definite volume of a radium solution of known strength. The results of the two methods of measurement, which agree fairly well, show that the amount of radium emanation in the atmosphere varies very considerably. On the average, the quantity contained in a cubic metre of air is equal to the amount which would be in radioactive equilibrium with about 1×10^{-10} gram of radium. No connexion between the variation in the concentration of the emanation and the meteorological conditions could be detected. The observed values indicate that only a small proportion of the natural ionisation of the air is due to the presence of the radium emanation and its products.

H. M. D.

Amount of Radium Emanation in the Atmosphere near the Earth's Surface. A. S. EVE (*Phil. Mag.*, 1908, [vi], 16, 622—632. Compare this vol., ii, 7).—Experiments according to the method already described have been continued at intervals for almost a year. An error in the previous calculations is pointed out, and this is corrected in the evaluation of the new experimental data.

The average amount of emanation present in a cubic metre of the air of Montreal during the period of the experiments is that which would be in equilibrium with 60×10^{-12} gram of radium. The observed variation in the concentration of the emanation is such that the maximum is to the minimum as 7 is to 1. Changes of temperature have little or no influence on the concentration of the emanation, but it increases on the approach of a deep cyclone accompanied by heavy rain or a thaw of snow, and decreases with anticyclonic conditions when the weather is dry or very cold. H. M. D.

The Heat Developed by Radium. EGON VON SCHWEIDLER and V. F. HESS (*Monatsh.*, 1908, 29, 853—862).—A quantity of over 1 gram of radium chloride was used for the experiments. A differential calorimeter was used consisting of two gilt-copper vessels in a chamber at constant temperature. One vessel contained the radium, and the other was heated by means of an electric current. Two copper-nickel thermo-junctions were balanced against one another, the heating current being adjusted until the temperatures were equal.

The results indicate a heat development of 118.0 cal. per hour for 1 gram of metallic radium, with a possible error of 1.4%. This is in good agreement with the value, 117 cal., obtained by Ångström (Abstr., 1906, ii, 63). C. H. D.

Relation between Uranium and Radium. III. FREDERICK SODDY (*Phil. Mag.*, 1908, [vi], 16, 632—638).—A further examination of the carefully-purified uranium salts prepared in 1905–06 has been made to ascertain the rate of production of radium (compare Soddy and Mackenzie, Abstr., 1907, ii, 730). In one case, the growth of radium is not greater than 5×10^{-11} gram per kilo. of uranium in $2\frac{1}{2}$ years, and in the other, it is not greater than 1×10^{-11} per gram kilo. of uranium in $1\frac{1}{2}$ years.

An examination of the residues from the highly-purified uranium salts has shown that the amount of radium present has increased about seven times during a period of one year. This indicates that a radium-producing substance is present in commercial uranium salts. Further, since the residues had been purified by the barium sulphate method with the object of removing radium and any intermediate products in the transformation of uranium into radium, it is established that the barium sulphate purification process does not remove the whole of this radium-producing substance. H. M. D.

Radiation of Uranium X. MAX LEVIN (*Physikal. Zeitsch.*, 1908, 9, 655—657. Compare Abstr., 1907, ii, 836).—As the distance between the radiating substance and the ionisation chamber is diminished, the ionisation produced by uranium X slowly increases at

first, attains a maximum value, and then rapidly diminishes. If the active substance is covered with a thin layer of aluminium, there is no evidence of this maximum ionisation value. The following explanation of the observed maximum in the case of the uncovered substance is given. As the distance between the source and the ionisation chamber increases, the actual number of ions which are discharged increases. When this distance is considerable, the strength of the electric field is not sufficient to bring about the discharge of all the ions before reunion takes place. If the ionisation per centimetre were constant, this should lead to a constant limiting ionisation when the distance is sufficiently great, but the fact that the strongly ionised layer in the immediate neighbourhood of the active substance is gradually removed from the measuring chamber influences the ionisation in such a way that, although an increase takes place at first with increasing separation, this is more than compensated for by the second effect when the distance has attained a certain value.

H. M. D.

Actinium C, a New Short-lived Product of Actinium. OTTO HAHN and LISE MEITNER (*Physikal. Zeitsch.*, 1908, 9, 649-655).—

Measurements of the ionisation produced by the α - and β -radiation emitted by the induced activity of actinium indicate that this consists of three disintegration products: actinium A, B, and C. Actinium C was separated from A by the action of finely-divided metals and animal charcoal on a solution of the active deposit, and its period of decay was found to be 5.10 minutes. It emits no α -rays, but the β -rays previously attributed to actinium B are found to be due to actinium C. The α -rays given off by the active deposit are entirely due to actinium B, whilst actinium A only emits a very readily absorbed type of β -radiation. In agreement with Bronson's determination, the decay period of actinium B is found to be 2.15 minutes, and that of actinium A, thirty-six minutes. These two products can be separated by heating the active deposit for about thirty seconds in a blow-pipe flame; the separation is not, however, complete even when the temperature is raised to 2000°.

Equations are given which represent the change in the α - and β -activity of the active deposit in agreement with the experimental observations.

H. M. D.

Range of Activity and Absorption of α -Rays. Secondary Radiation Produced by α -Rays. E. ASCHKINASS (*Ann. Physik.*, 1908, [iv], 27, 377-390).—An apparatus is described by means of which the charge on α -particles from polonium could be measured after passing through aluminium foil in a high vacuum. A magnetic field was employed to remove electrons and secondary radiation.

As found by other workers, layers of aluminium foil up to 13.7 μ in thickness allow the whole of the α -particles to pass. At about 24 μ , the particles are completely arrested. It is probable that complete absorption occurs suddenly at a definite thickness of aluminium.

Experiments with the same apparatus in the absence of a magnetic field indicate that the negative radiation from polonium considerably exceeds the positive in quantity. The secondary radiation produced by the α -particles may also be studied by its means.

C. H. D.

Ionisation of Gases by α -Rays, and the Hypothesis of Initial Recombination of the Ions. M. MOULIN (*Chem. Zentr.*, 1908, ii, 474—475; from *Le Radium*, 1908, 5, 136—141. Compare Abstr., 1906, ii, 720).—The hypotheses of Bragg and Kleeman, and Langevin, as explanatory of the unsaturation of an electric current at low *E.M.F.* when passed through a gas ionised by α -rays, have been tested by the author. The evidence so far obtained appears to support Langevin's view, that the α -rays produce a larger number of ions, which, however, become arranged along the path of the α -rays.

J. V. E.

Quality of the Secondary Ionisation due to β -Rays. WILLIAM H. BRAGG and J. P. V. MADSEN (*Phil. Mag.*, 1908, [vi], 16, 692—697).—Experiments are described which show that the secondary rays reflected by different substances struck by the same bundle of primary rays are not uniform in quality, but vary from one substance to another. For the purpose of collecting all the secondary rays, the authors have made use of an ionisation chamber with a hemispherical wall.

It is found that the secondary rays returned by substances of low atomic weight contain a relatively large proportion of less penetrating rays. When the less penetrating portions of the primary beam are cut off, the emitted secondary rays are found to be more penetrating. On account of these facts, observations of secondary radiation cannot be accurately made when ionisation vessels of the ordinary type are employed.

H. M. D.

Attempts to Detect the Production of Helium from the Primary Radio-elements. FREDERICK SODDY (*Phil. Mag.*, 1908, [vi], 16, 513—530).—Experiments have been made to obtain a quantitative estimate of the amount of helium produced from uranium and thorium. By the process recently described (Abstr., 1907, ii, 251), it is possible to detect 2×10^{-10} gram of helium by observation of the D_3 line. In an experiment in which 350 grams of thorium in the form of nitrate were employed, helium to the extent of about 2×10^{-10} gram was detected after a period of accumulation of nearly seven months. This corresponds with a rate of production of 2×10^{-12} per year. The two estimated rates of production, on the assumption that the helium atom is identical with an α -particle, are, according to two different methods, 2×10^{-12} and 4.5×10^{-12} . It may be pointed out that the former value is almost eight times less than the value calculated three years ago.

H. M. D.

Rate of Production of Helium from Radium. Sir JAMES DEWAR (*Proc. Roy. Soc.*, 1908, 81, 4, 280—286).—The rate of production of helium from radium was determined directly by observing the growth of pressure in a McLeod gauge connected with a vessel containing 70 mg. of radium chloride. A small tube containing coconut charcoal was sealed on to the gauge; the tube was kept in liquid air during an experiment, and served to condense any gases, other than helium or hydrogen, which might be generated in, or leak

into, the apparatus. Before starting an experiment, the apparatus was exhausted, first with a mercury pump, then with a large bulb containing charcoal immersed in liquid air, which was sealed off after some hours, and, finally, to a pressure of 0.00005 mm. by cooling the small charcoal bulb.

The second and more satisfactory experiment lasted 1100 hours. At intervals, the radium was heated to low redness, causing an increase of pressure after cooling to room temperature, which remained steady, showing that part of the helium had been occluded by the radium. Direct experiment showed that the helium was not appreciably occluded by the charcoal. It was further shown by examination of the spectrum, and by two other independent methods, that the helium was not contaminated with hydrogen.

A mean line drawn through the observations with the radium heated, shows a steadily maintained helium increment of approximately 0.37 c.mm. per gram of radium per day, a result which agrees almost exactly with that calculated by Rutherford on the assumption that the α -particle is an atom of helium carrying two ionic charges. On the other hand, Ramsay and Cameron (*Trans.*, 1907, 91, 1274) have determined the rate of production of the emanation from radium, the ratio of the amount of helium to that of the emanation being found by them to be 3.18; their value is about eight times as great as that of the author. It is pointed out in a footnote that Rutherford's experimental determination of the rate of production of the emanation gives a value about one-tenth that obtained by Ramsay, but in good agreement with the present results, on the assumption that the ratio of helium to emanation is 3 : 1. G. S.

Accumulation of Helium in Geological Time. ROBERT J. STRUTT (*Proc. Roy. Soc.*, 1908, 81, A, 272—277).—The experiments were undertaken in order to obtain a comparison of the helium content of minerals with their geological age. It was found that phosphatic nodules and phosphatised bones, occurring in such strata that their relative age was well defined, possessed a radioactivity much higher than that of rocks, and that the activity was connected with the presence of uranium minerals.

The helium was liberated by dissolving the minerals in acids, and separated from other gases by special methods. The radium content of the minerals was determined in the usual way, and from the results the percentage of uranium oxide calculated by comparison with a standard uranium mineral.

The ratio of helium to uranium oxide is not strictly proportional to the age of the strata, but high ratios are not found in the younger strata, whereas they are common in the older ones. The absence of direct proportionality is ascribed to imperfect retention of the helium.

From the results, on the basis of Rutherford's estimate of the rate of production of helium from radium, an attempt is made to calculate the age of the strata. The following are provisional *minimum* values:

Phosphatic nodules of the crag, 225,000 years; of the upper green-

sand, 3,080,000 years; of the lower greensand, 3,950,000 years; and hematite overlying carboniferous limestone, 141,000,000 years.

G. S.

Helium in Saline Minerals, and its probable Connexion with Potassium. ROBERT J. STURTT (*Proc. Roy. Soc.*, 1908, 81, A, 278—279).—The ratio of helium to uranium oxide has been determined (as described in the previous abstract) for the Stassfurt minerals, sylvine, carnallite, kieserite, and rock salt, and a number of other minerals from the same source have been examined qualitatively. Only for sylvine and carnallite is the ratio so high that it cannot be accounted for by the uranium present, and it is suggested that potassium may be the source of the helium in these two minerals (compare Campbell and Wood, *Abstr.*, 1907, ii, 217; McLennan and Kennedy, this vol., ii, 750).

G. S.

Electrical Conductivity of Alloys and their Temperature-coefficients. ERNST RUDOLFI (*Physikal. Zeitsch.*, 1908, 9, 607—609).—Polemical against Guertler (compare this vol., ii, 557).

H. M. D.

Conductivity of Fused Salts. KURT ARNDT and ALBERT GESSLER (*Zeitsch. Elektrochem.*, 1908, 14, 662—665).—The conductivities of a number of salts are measured by the method described by Arndt (*Abstr.*, 1906, ii, 418). The results (in reciprocal ohms per cm.) are:

	450°	500°	550°	600°	650°	700°	750°	800°	850°	900°	950°	1000°	1050°	1100°
CaCl ₂	—	—	—	—	—	—	—	1·90	2·12	2·32	2·50	2·66	2·76	—
KCl	—	—	—	—	—	—	—	2·19	2·30	2·40	2·50	2·61	—	—
KBr	—	—	—	—	—	—	1·65	1·75	1·85	1·95	2·05	—	—	—
KI	—	—	—	—	—	1·39	1·51	1·64	—	—	—	—	—	—
NaBr	—	—	—	—	—	—	—	3·06	3·23	3·30	—	—	—	—
NaI	—	—	—	—	—	2·56	2·63	2·70	2·76	2·83	2·90	—	—	—
AgCl	—	—	4·34	4·48	4·62	4·76	—	4·98	—	5·14	—	—	—	—
AgBr	2·93	3·02	3·10	3·18	—	3·34	—	3·50	—	3·68	—	—	—	—
AgI	—	—	2·46	2·52	2·59	2·64	—	2·72	—	—	—	—	—	—
NaPO ₃	—	—	—	0·80	0·425	0·55	0·675	0·80	0·925	1·05	1·175	1·30	1·42	1·54
BaO ₃	—	—	—	—	—	—	—	0·7	1·2	2·1	3·3	4·6	× 10 ⁻²	—

The conductivity is in all cases a linear function of the temperature; for the alkali salts it is approximately proportional to the absolute temperature. The conductivities of mixtures of potassium and sodium chlorides and of calcium and strontium chlorides are very nearly the mean of those of the constituents.

T. E.

Density and Equivalent Conductivity of Some Fused Salts. KURT ARNDT and ALBERT GESSLER (*Zeitsch. Elektrochem.*, 1908, 14, 665—667).—The density is determined by means of a platinum sinker and Westphal balance. The results are (in grams per c.c.):

	850°	900°	950°	1000°	1050°
CaCl ₂	2·03	2·01	1·99	1·97	—
SrCl ₂	—	2·69	2·67	2·645	2·62
BaCl ₂	—	—	—	3·12	3·09

For mixtures of calcium and strontium chlorides, the densities found are slightly smaller than the mean :

	700°	800°	900°	1000°	1100°
NaPO_3	2.22	2.18	2.14	2.10	—
BaCl_2	—	—	1.520	1.508	1.496

Mixtures of sodium metaphosphate and boron trioxide were measured at 900°; very considerable contraction occurs. In the following table, α is the percentage of sodium metaphosphate :

α	50	25	10	5	1.0	0.5
Density ...	2.115	1.820	1.655	1.586	1.552	1.522

The equivalent conductivities are calculated by means of the figures in the preceding abstract.

T. E.

Limiting Conductivity of Some Electrolytes in Ethyl Alcohol. PAUL DUTOIT and H. RAPPEPORT (*J. Chim. Phys.*, 1908, 6, 545—551).—The alcohol used in the measurements had a specific conductivity of the order 10^{-7} reciprocal ohms. The values of the limiting molecular conductivity, μ_∞ , were obtained directly by measurements in very dilute solution (up to a dilution of 20,000 litres) and indirectly by extrapolation from measurements in more concentrated solutions. The values of μ_∞ at 18°, expressed in Siemens units, are 39.2, 39.1, 35.8, and 35.0 respectively for the iodides of potassium, sodium, lithium, and ammonium, and 41.1 and 38.0 for the thiocyanates of potassium and ammonium respectively. Ammonium bromide gives 36.4, and sodium acetate, 31.8.

Kohlrausch's law holds for the electrolytes examined within the limits of experimental error, but the dilution law does not apply.

The order of the speed of the ions is the same in water and in alcohol, but the ratio of the speeds in the two solvents is by no means constant, varying from 1.8—3.1.

G. S.

A Light Accumulator. R. GOLDSCHMIDT (*Bull. Soc. chim. Bely.*, 1908, 22, 317—327).—An accumulator in which the electrodes are zinc and oxide of nickel, and the electrolyte a concentrated solution of potassium carbonate, is described. The changes taking place on charging and discharging are represented by the upper and lower arrows respectively in the equation $\text{Ni}_2\text{O}_3 + 2\text{Zn} \rightleftharpoons \text{NiO} + 2\text{ZnO}$, the electrolyte taking no direct part in the reaction. The nickel peroxide electrodes are prepared by electrolysis of a solution of nickel silicofluoride containing a little cobalt silicofluoride, nickel plates being used as anode, and the nickel deposited on a sheet of iron covered with nickel serving as cathode. A constant *E.M.F.* of about 2.75 volts is employed. After seven to eight hours' electrolysis, it is necessary to add a little cobalt silicofluoride and free hydrofluosilicic acid to the electrolyte to prevent the formation of a green mass on the cathode. The plate thus prepared is washed and oxidised electrolytically in a solution of sodium carbonate.

The zinc electrodes are prepared by electrolysis of a strong solution

of zinc silicofluoride containing a little free acid, zinc plates being used as anode, and the zinc deposited on iron as cathode. It is remarkable that much better deposits of zinc are obtained after the electrolyte has been in use for some time.

The plates thus prepared are immersed in a 43% solution of potassium carbonate or a 25% solution of sodium carbonate to form an accumulator; the potassium salt is preferable. An accumulator of this type has a capacity of at least 60 ampere-hours per kilo. of positive electrode; with a current of 15–20 amperes, the yield is about 100 watts, and the mean *E.M.F.*, 1.57 volts. It has the further advantage that it can be charged with a very large current, up to 50 amperes per kilo. of positive electrode, without damage. G. S.

Formation of Gas in Discharge Tubes. RUDOLF VON HIRSCH (*Physikal. Zeitsch.*, 1908, 9, 603–606. Compare Hirsch and Soddy, this vol., ii, 12).—The author has investigated the gas which is evolved from aluminium electrodes containing sodium as an impurity when cathode rays are generated by means of an influence machine. About 50% of the gas is absorbed by glowing copper oxide, and consists of hydrogen. The remainder appears to be carbon dioxide, for the spectral bands of this gas become much stronger after the removal of the hydrogen. This mixture of gases differs from others previously examined in that the product p^2V is constant, p being the gas pressure and V the discharge potential. It has been suggested previously (*loc. cit.*) that the constancy of p^2V is characteristic of pure gases, and this has led to a detailed examination of mixtures of hydrogen and carbon dioxide.

The value of p^2V for pure carbon dioxide is about $1/22$ of that for hydrogen; the connexion between the value of the product and the molecular weight of the gas does not hold therefore in this case. For mixtures of the two gases, p^2V is not constant; the curve, which represents the deviations of the product from a constant value, exhibits maxima for mixtures containing a large excess of one or the other gas, and a minimum for which $p^2V = 4$.

Analysis of two mixtures giving this minimum value showed that approximately equal quantities of the two gases are present. This mixture is the one produced from the aluminium electrodes, the constancy of the proportions between the two gases being maintained automatically. The formation of the gases is due to the action of water and carbon dioxide on the sodium contained in the aluminium.

H. M. D.

Chemical or Physical Theory of Volatilisation (of Cathodes). FRANZ FISCHER and OTTO HÄHNEL (*Zeitsch. Elektrochem.*, 1908, 14, 677–681). VOLKMAR KOHLSCHÜTTER (*ibid.*, 681–683).—Fischer and Hähnel regard the volatilisation as a purely physical phenomenon; Kohlschütter upholds his chemical hypothesis (this vol., ii, 457, 653, 799, and 800).

T. E.

Volatilisation of Cathodes in Attenuated Gases. B. WALTER (*Zeitsch. Elektrochem.*, 1908, 14, 695).—In Fischer and Hähnel's experiments (this vol., ii, 653), the current passing in the argon

and hydrogen tubes is the same, but the energy consumed is greater in hydrogen; hence for equal quantities of energy the volatilisation would be greater in argon.

T. E.

Behaviour of Calcium and Sodium Amalgams as Electrodes in Solutions of Neutral Salts. HORACE G. BYERS (*J. Amer. Chem. Soc.*, 1908, 30, 1584—1586).—Le Blanc and Novotný (Abstr., 1907, ii, 22) found that the values of the equilibrium constant of the reaction between sodium carbonate and calcium hydroxide, obtained by direct determination, did not agree with those calculated from the solubilities of calcium hydroxide and calcium carbonate. An attempt has therefore been made to determine this constant by measuring the *E.M.F.* of the cell $\text{CaHg}-\text{CaCO}_3-\text{Na}_2\text{CO}_3 \mid \text{NaOH}-\text{Ca}(\text{OH})_2-\text{CaHg}$, K being calculated from the equation $\pi = RT/7 \times \ln K/a$. The value of π , however, could not be satisfactorily determined, owing to the rapid action of water on the calcium amalgam, but interesting results were obtained on the action of solutions of salts on the amalgam. Similar experiments were made with sodium amalgam and solutions of salts. The results are tabulated.

It has been found that when amalgams are treated with solutions of salts of alkali or alkaline-earth metals, replacement occurs, and the determination becomes that of the *E.M.F.* of an electrode consisting partly of the amalgam of the metal of the added solution. Replacements of this character in concentrated amalgams have been recorded previously.

E. G.

Anomaly of the Strong Univalent Electrolytes M. KATAYAMA (*J. Coll. Sci. Tokyo*, 1908, 25, vii, 1—42).—By combining the views of Nernst (Abstr., 1901, ii, 647) and Jahn (Abstr., 1900, ii, 522; 1901, ii, 491; 1902, ii, 597) with those of Storch (Abstr., 1896, ii, 288) and Bancroft (Abstr., 1900, ii, 186), the author has deduced the following empirical formula:

$$K = \frac{c_i^n}{c_n} \left(\frac{c_i}{c_n} \right)^{0.3 \frac{c_i^2}{c_n}}$$

that is, $\log K = n \log \frac{\lambda}{\lambda_\infty} c - \log \frac{\lambda_\infty}{\lambda} c - 0.3 \frac{\lambda^2 c}{(\lambda_\infty - \lambda) \lambda_\infty} \log \frac{\lambda}{\lambda_\infty - \lambda}$,

where K is a constant, c_i the concentration of the ions in gram-mols per litre, c_n the concentration of the neutral, undissociated molecules, $c_i + c_n = c$ the total concentration, n a constant, λ the equivalent conductivity for the concentration c , and λ_∞ the equivalent conductivity for infinite dilution. The values obtained with this formula are in close agreement with the observed conductivities for every kind of univalent electrolyte.

In conjunction with Nernst's theory of solutions (*loc. cit.*), the following assumptions were made: $\pi_1 = a_1 c_n c_i^s$; $\pi_2 = a_2 c_i \left(\frac{c_i}{c_n} \right)^{0.3 \frac{c_i^2}{c_n}}$; where π_1 is the vapour pressure of the neutral molecule, π_2 the vapour pressure of the cation or anion, and a_1 , a_2 , and s are constants. The

values for the *E.M.F.* calculated on the second assumption are in fair agreement with the observed values. The partition-coefficient values obtained by Rothmund and Drucker for picric acid (Abstr., 1904, ii, 231) are well explained with the aid of the first assumption. By combining the two, it is possible to calculate the lowering of the freezing point of an aqueous solution of a strong electrolyte, which as a rule is in agreement with the observed depression. W. H. G.

The Size of Molecules and Charge of the Electron. JEAN PERRIN (*Compt. rend.*, 1908, 147, 594—596).—The number (*N*) of molecules in a gram-molecule, the charge (*e*) of the electron, and the ratio (*a*) of the mean energy of a molecule to its absolute temperature are universal constants, all of which are known when the value of one is determined, since (1) in the electrolysis of a univalent salt 96550 coulombs are conveyed by *N* atoms, whence $Ne = 3 \times 10^9 \times 96550$ electrostatic units; (2) the kinetic energy of a gram-molecule is measured by $3RT$, so that $2Na = 3R = 3 \times 83 \cdot 2 \times 10^6$.

The values 3×10^{-10} (Townsend), $3 \cdot 4 \times 10^{-10}$ (J. J. Thomson), $6 \cdot 8 \times 10^{-10}$ (J. J. Thomson), and $3 \cdot 1 \times 10^{-10}$ (H. A. Wilson) have been found for *e*, and from them values varying from 43×10^{22} to 96×10^{22} derived for *N*. Planck has obtained the value $2 \cdot 02 \times 10^{-16}$ for *a* and deduced 61×10^{22} for *N*, but Lorentz from the same data finds $N = 77 \times 10^{22}$. The author has determined *N* by a method based on the assumption that equal particles distribute themselves in a dilute emulsion in the same manner as molecules of the same mass which obey the gas laws. This leads to the equation $2 \cdot 3 \log_{10} n_0/n = N/R[4/3\pi a^2 g(d-\sigma)h]$, in which *n* and *n*₀ signify the concentrations of the particles at levels separated by the distance *h*, *a* the radius of the particles, and (*d* - *σ*) the excess of their density over that of water. After finding that particles of very different size gave the same value for *N*, the value 71×10^{22} was obtained, and the values $4 \cdot 1 \times 10^{-10}$ and $1 \cdot 7 \times 10^{-16}$ thereby deduced for *e* and *a* respectively. From this value of *N*, the mass of the oxygen molecule is $0 \cdot 45 \times 10^{-22}$ gram, of the hydrogen atom $1 \cdot 40 \times 10^{-24}$ gram, and of the corpuscle $0 \cdot 75 \times 10^{-27}$ gram. E. H.

Magnetic Susceptibility of Solutions. P. PASCAL (*Compt. rend.*, 1908, 147, 242—244. Compare this vol., ii, 756).—The rule that a magnetic atom becomes more diamagnetic the more it enters into complex ions or colloidal molecules, and becomes removed from its characteristic chemical properties, has been verified in the cases of certain ferrous, cobalt, chromium, copper, and mercury salts. Ferropyrrophosphates, ferro-oxalates, and ferrometaphosphates are oxidised at rates which are in order of their magnetism. The decrease of magnetism on adding sodium carbonate to these salts is accompanied by a slower rate of oxidation. R. J. C.

Relation of Melting Point to the Surface of the Granules of a Solid Substance. P. N. PAWLOFF (*J. Russ. Phys. Chem. Soc.*, 1908, 40, 1022—1066).—From theoretical considerations, the author shows that the relation between the melting point, *T*, of a substance and the

radius, r , of its granules is expressed by the following differential equation:

$$dT/dr = [A(v_2 - v_1)p \cdot 2k/r^2 \cdot dR\sigma] / [\rho + A(v_2 - v_1)p \cdot 2k/r \cdot dR\sigma T],$$

where A is a constant independent of the magnitude of the granules for any given temperature, and is given by the expression: $\log Ap = 2k/rdR\sigma T$; k is the surface tension at the separation of the solid from vapour; r the radius of the spherical granules; σ the specific volume of the vapour; ρ the specific heat of liquefaction; v_2 and v_1 the volumes of unit masses of the liquid and solid respectively at the melting point.

Granules of commercial salol having a magnitude of 8μ melt 3.5° lower than those 32μ in size. After one recrystallisation, granules of 6μ — 40μ melt within an interval of 1.5° . Dust having dimensions less than 2μ melts, in the case of salol 7° , with antipyrine 5 — 7° , and with phenacetin 4° , lower than large granules of diameter 0.5 — 2 mm.

T. H. P.

Apparatus for Determining the Freezing Point of Mixtures.

Otto SCHEUER (*J. Chim. Phys.*, 1908, 6, 620—624).—Two forms of apparatus suitable for determining the freezing point of mixtures are described. The first is a modified Beckmann apparatus. The essential feature of the second is that the stirring is concentric, and is effected by means of the thermometer, to the lower part of which two strips are attached for this purpose.

G. S.

Negative Adsorption. REGINALD O. HERZOG (*Zeitsch. physikal. Chem.*, 1908, 57, 315—316).—Tezner and Roske state (this vol., ii, 810) that negative adsorption does not occur. This, however, is only true when the adsorption of a single substance is dealt with, and instances are given where, under other conditions, the phenomenon does take place.

W. D. H.

The Fusion Curves of the System Naphthalene-Phenol.

T. YAMAMOTO (*J. Coll. Sci. Tōkyō*, 1908, 25, xi, 1—23).—The freezing-point curve of mixtures of naphthalene and phenol was determined by the cryoscopic method, a correction being made for supercooling. The eutectic point lies at 29.7° and 15.7 mol. % naphthalene. The form of the phenol curve is explained as being due to the association of phenol in the liquid state, represented by the equilibrium $3C_6H_5O \rightleftharpoons (C_6H_5O)_3$. The equilibrium constant of this association is expressed as a function of temperature, the heat of association being also determined.

C. H. D.

The Fusion Surfaces of the System Naphthalene-Chlorobenzene-Phenol, and the Molecular Association of Phenol. H. HIROBE (*J. Coll. Sci. Tōkyō*, 1908, 25, xii, 1—50. Compare preceding abstract).—The fusion surfaces (freezing-point surfaces) of naphthalene and phenol in the ternary system have been determined, an accurate cryoscopic method being employed. The two surfaces are separated by a eutectic curve, the projection of which on the plane of composition is nearly a straight line. The form of the surfaces is

consistent with the assumption that naphthalene and chlorobenzene are non-associated, and that phenol is partly associated to triple molecules. The latter conclusion was supported by determinations of the partition-coefficient of phenol between chlorobenzene and an aqueous solution of sodium chloride and sodium sulphate. C. H. D.

Arrangement for Liquefying and Distilling Easily Condensable Gases and Low-boiling Liquids. AUREL VON BARTAL (*Chem. Zeit.*, 1908, 32, 891).—A U-shaped form of receiver which can be completely immersed in a freezing mixture contained in a vessel consisting of two concentric cylinders between which there is a layer of asbestos; in this way, a very effective condensation is ensured. When removed from the freezing mixture, the apparatus can be employed as a distillation flask by gently warming it; the distillate may be condensed in a second similar apparatus cooled in a freezing mixture. P. H.

Practical Studies in Vacuum Sublimation. RICHARD KEMPF (*J. pr. Chem.*, 1908, [ii], 78, 201—259).—The employment of sublimation in a vacuum as a means of purification entails a smaller loss of substance than does recrystallisation, whilst, on the other hand, in consequence of the slower volatilisation, a more complete separation of a mixture is secured than by fractional distillation. The author describes an arrangement for sublimation experiments suitable for use in a laboratory, consisting of a glass tube on to one end of which is ground a glass cap with a tap and nozzle for connecting with the pump, and on to the other a bent pear-shaped glass bulb. This bulb, containing the substance to be sublimed, is heated in a suitable air-oven; the straight tube projecting through a hole in the side of the oven serves as the receiver for the sublimate. The phenomena of sublimation are discussed, and details given of experiments with fifty-three inorganic and organic compounds. G. Y.

Heat of Combination of Acidic Oxides with Sodium Oxide and Heat of Oxidation of Chromium. WILLIAM G. MIXTER (*Amer. J. Sci.*, 1908, [iv], 28, 125—137. Compare Abstr., 1907, ii, 738).—The heats of formation of sodium orthoborate, aluminate, chromate, and tungstate have been determined by firing mixtures of sodium peroxide with the metals or with metallic oxides in presence of carbon. Incidentally, the heats of formation of chromium sesquioxide and trioxide were calculated. Since the salts in question are largely hydrolysed by water, previous determinations by Thomsen, Berthelot, and others which referred to solutions are regarded as less trustworthy than those obtained by the sodium peroxide method. The heat of formation of sodium sulphate, on the other hand, is found to be the same by both methods. The principal results obtained were:

$3\text{Na}_2\text{O} + \text{B}_2\text{O}_3 = 2\text{Na}_3\text{BO}_3$	104,200 cal.
$\text{Na}_2\text{O} + \text{Al}_2\text{O}_3(\text{amorphous}) = 2\text{NaAlO}_2 +$	40,000 "
$\text{Na}_2\text{O} + \text{CrO}_3 = \text{Na}_2\text{CrO}_4$	77,000 "
$\text{Na}_2\text{O} + \text{WO}_3 = \text{Na}_2\text{WO}_4$	94,700 "
$\text{Cr} + 3\text{O} = \text{CrO}_3$	140,000 "
$2\text{Cr} + 3\text{O} = \text{Cr}_2\text{O}_3(\text{amorphous})$	243,800 "

The heats of transformation of aluminium and chromium oxide from the amorphous to the crystalline state were also determined.

During the combustions which were made in a silver bomb, or a silver cup suspended in a steel bomb, a small amount of oxygen was always liberated, for which a correction was necessary. R. J. C.

Viscosity of Certain Metals and its Variation with Temperature. CHARLES E. GUYE and S. MINTZ (*Arch. sci. phys. nat.*, 1908, 23, 136—166, 263—278).—From observations on the rate of decrease of the amplitude of vibration of loaded wires when twisted, the authors have compared the viscosity of platinum, silver, gold, copper, and steel at different temperatures. To eliminate the damping effect of the air, the vibrating wire was enclosed in an apparatus which could be exhausted.

The viscosity increases with the temperature in the case of platinum, silver, gold, and copper, and the curves which express the relationship between the two factors are of the same type. In the case of steel, the viscosity increases up to about 100°, then falls, and passes through a minimum value at about 200°, above which it increases very rapidly. This phenomenon can be observed both with rising and falling temperatures, indicating that it is due to reversible changes.

The influence of temperature on the viscosity is diminished by previous annealing; it increases when the load on the wire is increased. H. M. D.

Viscosity of Dilute Alcoholic Solutions. TOSHIO HIRATA (*J. Coll. Sci. Tōkyō*, 1908, 25, v, 1—15).—Arrhenius has shown (Abstr., 1880, 336) that the viscosity of an aqueous solution of any two indifferent substances may be expressed by the formula $\eta = A^x B^y$, where A and B are two constants characteristic of the two solutes at a constant temperature, x and y being their respective volume percentages. With the object of ascertaining whether ethyl-alcoholic solutions follow the same law, the viscosities of ethyl-alcoholic solutions of various liquids, chiefly organic, have been measured. It is found that the formula can be applied to the solutions of all the substances examined, the error being less than 1% for solutions containing less than 10% by volume of the dissolved substance. Water, however, forms an exception; in this case, the formula can be applied only to very dilute solutions. When the concentration exceeds 3% by volume, the error is greater than 1%. W. H. G.

Viscosity and Ionic Volume. FREDERICK H. GETMAN (*J. Chim. Phys.*, 1908, 6, 577—583. Compare this vol., ii, 464).—Jones and Veazey (Abstr., 1907, ii, 438) have pointed out that the salts which diminish the viscosity of water have a large ionic volume, and there is evidence that for salts with the same anion the diminution of viscosity of the solvent is proportional to the atomic volume of the cation. In the present paper, this relationship is further illustrated by application to a number of nitrates and chlorides.

In order to show the relationship more clearly, the viscosity of solutions of the same salts is compared, when the degree of dissociation

tion in each case is 75%. Under these circumstances, the viscosity, η , is represented by the formula :

$$10^4 \times \eta = 89 \pm 0.0242C_m$$

where C_v is the atomic volume of the cation, and 89 represents the viscosity of water at 25°, there being good agreement between found and calculated values. On the other hand, there is no apparent connexion between the viscosity and the sum of the volumes of the ions and unionised molecules. G. S.

Changes in Internal Friction due to Protein Degradation. KARL SCHÖRR (*Biochem. Zeitsch.*, 1908, 13, 173—176).—Experiments were carried out with dialysed salt-free serum, which was treated with sodium hydroxide in various dilutions. An Ostwald viscosimeter was used for the measurements.

On treatment with the alkali, there is at first an increase in the internal friction, which is followed by a steady fall. A similar phenomenon is brought about by hydrochloric acid ; in the latter case, however, the fall is followed by a second rise, which is accompanied by a gradual separation of a precipitate from the liquid, which is finally sufficient to impede entirely the flow of liquid through the viscosity tube. S. B. S.

Diffusion of Gaseous Ions. ÉDOUARD SALLES (*Compt. rend.*, 1908, 147, 627—629).—The author has measured the coefficient of diffusion of gaseous ions towards the walls of narrow metallic containing tubes. The coefficient for positive ions is 0.031, and for negative ions 0.041, the value being unaffected by interchanging tubes of German silver, brass, and steel. Contrary to J. J. Thomson's supposition, the nature of the metal has no specific influence on the rate of diffusion of gaseous ions towards it. R. J. C.

Osmotic Pressure of Concentrated Solutions of Non-electrolytes. OTTO SACKUR (*Chem. Zentr.*, 1908, ii, 473 ; from *Jahrb. Schlesisch. Ges. Vaterl. Kultur*, 1908, 86, 1—14).—According to the experiments of Morse and Frazer, aqueous sucrose solutions above 20° exert an osmotic pressure equal to the corresponding gas pressure, when the concentration is defined as the number of molecules of the dissolved substance in a volume of the solvent (*Abstr.*, 1907, ii, 744). At lower temperatures, this agreement is not observed. If, however, the concentration is regarded as being expressed by the number of molecules of dissolved substance in a volume of the solution, the equation $p(v-b)=RT$ is applicable for all the observations with sucrose and dextrose. Contrary to the gas law, b , in the above equation, varies considerably with alteration of temperature ; for sucrose, it decreases from 0.31 (per litre) to 0.20 when the temperature rises from 0° to 20°, and for dextrose, from 0.16 to 0.093 under a like change of temperature. The author suggests that this is due to the hydration of the dissolved substance decreasing with rise of temperature. J. V. E.

Polymerisation and Dissociation of Molecules in the Liquid State. GEORGE G. LONGINESCU (*J. Chim. Phys.*, 1908, 6, 552—566. Compare *Abstr.*, 1905, ii, 79).—With reference to the relation between

the boiling point and molecular weight, Walker has pointed out that the formula $T/\sqrt{m}=37$ (m =molecular weight; T =boiling point on the absolute scale) holds more particularly for a number of hydrocarbons, but is not generally applicable. The author now shows that the modified expression $T/\sqrt{m+(1000\sqrt{m})/T}$ is about 64 for all the normal substances examined, and varies from 65 for slightly polymerised substances to 99 for water.

The above equation has two roots, $\sqrt{m_1}=T/37$ and $\sqrt{m_2}=T/27$. The ratio T/\sqrt{m} is termed x_1 , and $1000\sqrt{m}/T$ is termed x_2 . It is only for certain hydrocarbons and some other substances that $x_1=37$ and $x_2=27$; for the majority of substances, x_1 is less than 37, and x_2 greater than 27. This is taken to mean that, in the liquid state, the molecules of most substances are partly polymerised and partly dissociated, the mean of the weights of the molecules being the theoretical molecular weight, and the views of other observers are adduced in support of this opinion.

The "factor of dissociation," $K_1=(x_1/37)^2$, and the "factor of polymerisation," $K_2=1.88K_1$, are given in tabular form for all the liquids considered.

G. S.

The Chemical Theory of Solutions. I. K. IKEDA (*J. Coll. Sci. Tôkyô*, 1908, 25, x, 1—80).—An ideal solution is defined as a homogeneous liquid mixture, of which the volume and energy are the sum of the volumes and energies respectively of the components in the liquid state under the same pressure and at the same temperature. An attempt is made to explain all deviations from the properties of an ideal solution by assuming reversible chemical reactions within the solution and applying the law of mass action. The treatment is mathematical, and the results are applied to concrete cases.

C. H. D.

Hardness of Solid Solutions of Metals and of Definite Chemical Compounds. NICOLAI S. KURNAKOFF and S. F. SCHEMTSCHUSCHNY (*Zeitsch. anorg. Chem.*, 1908, 60, 1—37; *J. Russ. Phys. Chem. Soc.*, 1908, 40, 1067—1104).—The degree of hardness of a number of binary alloys, the structure of which is known, is plotted against the composition, and in the majority of cases the electrical conductivity is represented on the same diagram. The data for the bronzes and brasses and certain other alloys are due to previous observers, and the authors have themselves determined the hardness of the binary alloys copper-nickel, gold-copper, and gold-silver. It is shown that practically the same results are obtained whether the hardness is determined by the sclerometer (ruling lines on a prepared surface of the alloy), by the resistance to penetration, or by other methods.

The more important results of the investigation are as follows: (1) the formation of mixed crystals is accompanied by an increase in hardness; (2) the hardness of an unbroken series of mixed crystals can be represented by a continuous curve showing a maximum; (3) in the latter case, the maximum of the curve of hardness coincides with the minimum of the curve of electrical conductivity. (4) At

points corresponding with the extremities of the series of mixed crystals (when the miscibility of the metals is incomplete), there are breaks in the curve of hardness.

Experiments have also been made on the pressures required to force certain plastic binary mixtures in a thin stream through a small opening, and the pressures just sufficient for this purpose are plotted against the composition. These limiting pressures are roughly proportional to the hardness of the alloys. The curves for the isomorphous mixtures of *p*-dichloro- and *p*-dibromo-benzenes and of silver chloride and bromide show maxima, but that for zinc-tin alloys shows no maximum, corresponding with the fact that these metals have little or no tendency to form solid solutions.

Finally, when the metals form a chemical compound, the latter may be harder or softer than either of the components, and the curve obtained by plotting hardness against composition may show either a maximum or minimum. A number of examples illustrating this case are cited. G. S.

Causes Modifying the Dominant Faces of Crystals: Solid Solutions. PAUL GAUBERT (*Compt. rend.*, 1908, 147, 632—635. Compare Abstr., 1906, ii, 343).—Foreign matter is distributed between crystals and their mother liquor in a definite ratio. The crystalline habit may be modified, not only by crystallisable foreign matter, but by liquid molecules, and even by the mother liquor itself.

Crystals of phthalic acid from aqueous solutions are modified in the same sense by methyl, ethyl, and propyl alcohols, glycerol or aldehyde in small quantities. The minute amount of alcohol in the crystals augments as the proportion of alcohol in the mother liquor increases, but the alcohol is not merely in the state of occluded mother liquor. Methylene-blue, which favours a different crystalline habit in phthalic acid, also hinders the entrance of alcohol into the growing crystals. R. J. C.

Ultra-microscopic Observations. J. REISSIG (*Ann. Physik*, 1908, [iv], 27, 186—212).—The colloidal solutions of brown, tellurium, selenium, and silver, and of red and blue gold, prepared by Paal (compare Abstr., 1902, ii, 500, 508; 1905, ii, 158) have been examined by means of the ultra-microscope. These solutions contain the sodium salts of protalbic and lysalbic acids (compare Abstr., 1902, i, 653), which act as protective colloids. From the number of particles contained in a given volume, the linear dimensions of the particles of the colloidal elements are calculated. It is found that the number of observable particles is not proportional to the concentration of the dissolved colloid, for all the particles can only be seen in dilute solutions. The number of particles seen through the ultra-microscope is, for a given solution, proportional to the intensity of the source of light used.

The ultra-microscope has also been employed to examine the behaviour of colloidal gold solutions on the addition of hydrochloric acid. The slowness with which flocculation takes place is supposed

to represent the stability of the solution, and for both red and blue solutions, one maximum and two minimum positions of stability have been identified. The position of maximum stability corresponds with the isoelectric point of the solution. In dilute solutions the stability of the colloidal gold is greater than it is in concentrated. The rate at which a given quantity of hydrochloric acid causes flocculation to take place depends on the concentration of the acid, the rate decreasing as the concentration of the acid decreases.

The Dynamic Theory of a Reversible Chemical Reaction. II. ERNST COHEN and TH. STRENGERS (*Chem. Weekblad*, 1908, 5, 719—721. Compare this vol., ii, 824).—Polemical. A reply to Smits and Wibaut.

A. J. W.

The Dynamic Theory of a Reversible Chemical Reaction. ANDREAS SMITS and J. P. WIBAUT (*Chem. Weekblad*, 1908, 5, 771—772).—Polemical. A reply to Cohen and Strengers (this vol., ii, 824).

A. J. W.

Lecture Experiment to Demonstrate the Law of Mass Action. EMIL ABEL (*Zeitsch. Elektrochem.*, 1908, 14, 630—631).—The diminution of the concentration of the hydrogen ions in a solution of acetic acid by sodium acetate is shown by means of the reaction between hydriodic acid and hydrogen peroxide. In acid solutions, iodine is liberated; in almost neutral solutions, oxygen is given off. The difference between a solution of acetic acid, potassium iodide, and hydrogen peroxide, on the one hand, and the same solution with the addition of sodium acetate, on the other, is very striking (compare this vol., ii, 939).

T. E.

Application of the Kinetic Theory to the Metals. G. REBOUL (*Chem. Zentr.*, 1908, ii, 473; from *Le Radium*, 1908, 5, 129—136).—It is assumed that in metals there are free negative electrons and positive atom ions. The free electrons must, then, have a definite tendency to pass from the metal into the surroundings. It therefore follows that at the perimeter there must be a double film metal/gas, and also a potential difference, as in the Nernst theory for the perimeter metal/solution. The equilibrium between the electrons that leave the metal and the electrical energy is influenced by a change of temperature. In this is found a simple explanation of the phenomena of electric capillarity, thermal electricity, and electron rays when substances are strongly heated.

J. V. E.

Velocity of Reaction. JOHANNES J. VAN LAAR (*Chem. Weekblad*, 1908, 5, 747—764).—A theoretical paper containing a continuation of the author's statement of his new thermodynamic theory (this vol., ii, 824).

A. J. W.

Equilibrium of Two Substances in a Mixed Binary Solvent. E. D. VOLCHONSKY (*J. Russ. Phys. Chem. Soc.*, 1908, 40, 941—993).—A theoretical paper, in which the author considers: (1) The coefficient of distribution in a homogeneous system.

(2) Le Chatelier's principle of the opposition of action and reaction, and the conditions of existence of inverse systems. (3) Equilibrium of heterogeneous systems. (4) The energy relations between the members of a system. (5) The influence of temperature on the equilibrium of the system. (6) The classification of the reactions effecting the equilibrium of the system.

T. H. P.

Equilibria in Quaternary Systems. FRANS A. H. SCHREINERMAKERS (*Proc. K. Akad. Wetensch. Amsterdam*, 1908, 11, 138—142. Compare this vol., ii, 571).—The system copper sulphate, ammonium sulphate, lithium sulphate, and water has been studied at 30°. In addition to the three sulphates named, there are two solid compounds involved in the equilibria, namely, $\text{CuSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ and $\text{Li}_2\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4$. The equilibria are represented with the aid of a tetrahedron, all saturation lines and surfaces being projected perpendicularly on one of the side planes of the tetrahedron. J. C. P.

Kinetics of Successive Reactions. Reduction of Chromic Acid by Oxalic Acid. K. JABŁCZYŃSKI (*Zeitsch. anorg. Chem.*, 1908, 60, 38—49.* Compare Luther and Rutter, *Abstr.*, 1907, ii, 555).—The rate of reaction between chromic acid and excess of oxalic acid in dilute solution has been measured at 15°, the course of the reaction being followed by estimating the concentration of chromic acid in a portion of the solution from time to time with iodide and thiosulphate. The velocity is proportional to the concentration of the chromic acid when different initial concentrations of the latter are used, but the constants calculated according to the unimolecular formula increase considerably during the reaction. Excess of chromic salt does not influence the rate of the reaction.

On the assumption that the reaction takes place in the three stages $\text{Cr}^{\text{VI}} \rightarrow \text{Cr}^{\text{V}}$ (1), $\text{Cr}^{\text{V}} \rightarrow \text{Cr}^{\text{IV}}$ (2), $\text{Cr}^{\text{IV}} \rightarrow \text{Cr}^{\text{III}}$ (3), and that all three reactions are unimolecular, an equation is deduced from which, by an approximation method, the following values are obtained for the constants of the three successive reactions $k_1 = 0.0344$, $k_2 = 0.1322$, $k_3 = 0.0238$. Other measurements were made in which the conditions were varied considerably, but, although the ratio of the constants calculated from these observations varied somewhat, the order remained the same.

The above conclusion, that the reaction $\text{Cr}^{\text{V}} \rightarrow \text{Cr}^{\text{I}}$ is very rapid and that the other reaction, $\text{Cr}^{\text{IV}} \rightarrow \text{Cr}^{\text{III}}$, is comparatively slow, is in accordance with what is known of the behaviour of quinquivalent and quadrivalent chromium salts.

G. S.

Formation of Salts and Basicity of Acids. GIUSEPPE BRUNI (*Zeitsch. Elektrochem.*, 1908, 14, 701—706).—Measurements are made of the conductivity of an acid and of mixtures of the acid and its potassium salt. In each series of measurements, the total concentration of the acid is kept constant, the series extending from pure acid at one end to pure potassium salt at the other. Acetic, formic, monochloroacetic, cyanoacetic, and di- and tri-chloroacetic acids are used; they form a series of gradually increasing strength. Each acid is used in eleven different concentrations from N to $N/1024$.

* and *Bull. Acad. Sci. Cracow*, 1908, 603—620.

The results are given in the form of tables and curves. For acetic acid of normal strength, the molecular conductivity increases as the neutralisation proceeds; in weaker solutions a minimum occurs near the acetic acid end of the curve. This minimum becomes more pronounced, and is found nearer the normal salt end of the curve, with formic acid; with the stronger acids the conductivity of the acid is greater than that of its potassium salt (except in the stronger solutions), and the minimum becomes less marked as the acid used is stronger, until with trichloroacetic acid it disappears altogether, the curves being straight lines. The theoretical discussion of the results is reserved for a later paper.

T. E.

Reduction of Solutions of Potassium Permanganate Acidified with Sulphuric Acid in the Presence of Mineral Salts. T. WARYNSKI and P. TCHEICHVILI (*J. Chim. Phys.*, 1908, **6**, 567—576).—The experiments were made with approximately 1/100 molar solutions of potassium permanganate and 1/30 molar sulphuric acid, and varying concentrations of salts. In some cases observations extended over four months. After the experiment, the amount of change was determined by titration with ferrous sulphate.

Most of the salts used as catalysts exerted an accelerating action in the dark, but a retarding action in daylight. Also, in green and blue light most salts retarded the action, but in orange light a slight acceleration was observed; the retarding effect, therefore, probably depends on the actinic rays.

Rise of temperature also affects the catalytic power of salts on the reaction; it increases the activity of the sulphates of iron, chromium, and aluminium, but retards the action of cadmium sulphate. The activity of certain catalysts, such as ferric alum, increases with the concentration.

G. S.

Esterification of Trichloroacetic Acid. ANTON KAILAN (*Monatsh.*, 1908, **29**, 799—844. Compare this vol., ii, 28).—The esterification of mandelic acid is not retarded by the presence of water up to 4 gram-mols. per litre. The influence of water on the esterification of phenylpropionic acid is much less when trichloroacetic acid is used as a catalyst than when hydrogen chloride is employed.

The relation between the velocity constant and the concentrations of the water and hydrogen chloride in the esterification of trichloroacetic acid is expressed by the equation: $1/k = 6.554 + 4.850/c + 0.0985/c^2 + (-40.15 + 35.39/c - 0.9550/c^2)w + (-16.90 + 12.98/c - 1.259/c^2)w^2$. The ratio of the velocity constants with hydrogen chloride and trichloroacetic acid respectively as catalysts is for phenylpropionic acid four times as great as for trichloroacetic acid. The presence of ethyl trichloroacetate does not retard the esterification. The ester is very little hydrolysed by the catalysts in nearly dry alcohol, but considerably in presence of water. The results are not in accordance with the theory of catalysis by hydrogen ions.

C. H. D.

Method of Calculating Atomic Weights. LOUIS DUBERUL (*Compt. rend.*, 1908, **147**, 629—632).—The method introduced by Hinrichs (*Abstr.*, 1907, ii, 945) of calculating the atomic weights of

all the elements present in a single reaction depends on a graphic construction, and is thus limited to reactions in which not more than three elements participate. The author develops Hinrichs' theorem analytically, obtaining equations whereby true atomic weights can be calculated from any reaction, however complex. The method consists in finding the minimum deviations from round number atomic weights which will account for experimental values within their limits of error. The true deviations are then to be obtained by averaging results obtained by different experimenters and methods.

R. J. C.

Connexion between Residual Affinity and Additivity. WALTER PETERS (*Ber.*, 1908, 41, 3175—3186).—Although the compounds of ammonia with the salts of heavy metals have been fully examined, the compounds with the salts of more strongly electro-positive metals have not been so closely examined, owing to their high dissociation pressure. The investigation has been made by means of Ley and Wiegner's apparatus (*Abstr.*, 1905, i, 749), as the formation of the additive ammonia compound occurs in an atmosphere of ammonia, and it also allows of the effect of temperature being determined.

Well-defined increase in the number of ammonia molecules absorbed by lowering the temperature was only given by silver chloride, platinum-chloride, bromide, and platinocyanide; in the other cases, ammonia was absorbed, and liquids were obtained containing a large percentage of ammonia.

The table summarises the results obtained at the ordinary temperature, I giving the number of ammonia mols. absorbed, and II the number retained after evacuation:

	I.	II.		I.	II.
Cobalt cyanide	2	0	Potassium aurithiocyanate var.	4	
Cobalt thiocyanate	6	2	Platinous chloride	5	4
Nickel thiocyanate	6	3	Silver platinochloride	6	3
Nickel dithionate	6	4	Potassium platinocyanide ..	1	0
Mercuric thiocyanate	4	1	Silver platinocyanide	4	2
Mercuric acetate	4	2	Cobalt platinothiocyande ..	6	2
Mercuric propionate	4	2	Potassium platinothiocyane		
Silver chloride	1.5	0	ate	2	2
Silver bromide	1.5	0	Silver platinothiocyande ..	6	4
Silver iodide	0.5	0	Sodium platinichloride ..	6	5
Silver cyanate	1	0	Silver platinichloride	8	4
Silver thiocyanate	2	0	Potassium platinithiocyan-		
Potassium aurichloride ..	3	0	ate	12	6
Potassium aurothiocyanate	5	2	Silver platinithiocyanate...	14	6

The platinic salts, in general, absorb more ammonia than the platinous, and the metals, gold or platinum, more than silver or mercury.

W. R.

An Apparatus for Extraction by Hot Ether. WILHELM KULKA (*Biochem. Zeitsch.*, 1908, 13, 134—137).—An extraction apparatus somewhat similar to Soxhlet's, but so modified that the vessel containing the substance to be extracted is surrounded by the ether vapour, its contents therefore being nearly at the temperature of boiling ether (about 30°).

S. B. S.

New Forms of Condenser. H. STOLTZENBERG (*Chem. Zentr.*, 1908, ii, 277; from *Zeitsch. Chem. Appar.*, 1908, 3, 243—245).—The condensers described have the advantage of exposing four cooling

surfaces to the vapour, are light and compact, and may be readily cleansed by removing the inner portion with the stopper. The accompanying figures should explain their construction. J. V. E.

A New Aspirating Reflux Condenser. HENRI VIGREUX (*Bull. Soc. chim.*, 1908, [iv], 3, 855—857).

—This consists of a Liebig condenser in which the water outflow pipe is fused to a small aspirator acting on the principle of an ordinary filter-pump. The air-exhaust tube of this aspirator is connected with the upper end of the inner condensing tube. The latter is provided on its inner surface with points and mounds in order to facilitate condensation. The effect of a current of water through the condenser envelope is thus to pro-

duce an upward current of air in the inner condensing tube, and it is claimed that such a condenser placed above an open vessel (basin, beaker or flask) containing the boiling liquid condenses the whole of the vapours, returning the condensed liquid to the vessel even when the liquid consists of ether, alcohol, light petroleum, or carbon disulphide. The apparatus is also of use in reactions involving hydrogen chloride or bromine or iodine vapours. E. H.

A New Aspirating Condenser and Recuperator for Rapid Evaporations. HENRI VIGREUX (*Bull. Soc. chim.*, 1908, [iv], 3, 858).—This is simply the condenser described previously (preceding abstract), of which the inner tube is provided, immediately below the outer jacket, with a side-tube arranged to collect the condensed liquid and to convey it through a trap (to prevent the aspirator from drawing air through this side-tube) into a receiver. Solutions in ether, light petroleum, benzene, or carbon disulphide can be thereby rapidly evaporated without risk of ignition. The lower end of the condenser should be placed slightly above the surface of the liquid when the latter is contained in a basin, and in the middle of the neck of a flask when this vessel is used. E. H.

A Simple Form of Sprengel Vacuum Pump. JAMES ARTHUR POLLOCK (*J. Roy. Soc., New South Wales*, 1907, 41, 140—143).—A modified short fall Sprengel pump, in which the raising of the mercury is effected by evaporating the mercury at a lower and condensing it at a

higher level; the mercury on reaching the bottom of the fall tube enters a horizontal tube, the farther end of which is bent vertically upwards; this vertical limb bears a bulb in which the mercury is boiled, the vapours being condensed by passing through a Liebig's condenser the lower end of which is connected to the fall tube. The apparatus must be used in connexion with an efficient auxiliary pump. P. H.

Turbine Funnel for Mixing Solutions. A. GAWALOWSKI (*Zeitsch. anal. Chem.*, 1908, 47, 697).—The apparatus is intended for the purpose of mixing a reagent with a solution. It consists of a funnel the stem of which is provided at the bottom with two arms placed at right-angles to the stem and ending in fine curved jets. A glass bulb is attached to the stem just below the funnel, and acts as a float, whilst the apparatus is kept in an upright position by means of a small quantity of mercury contained in a bulb below the two arms. The apparatus is floated in a solution contained in a beaker, and the reagent is poured into the funnel; as it escapes into the solution through the jets, the apparatus is caused to revolve, and the reagent and solution are thus mixed. W. P. S.

Inorganic Chemistry.

Catalysis of Hydrogen Peroxide by Iodine and Iodine Ions. EMIL ABEL (*Zeitsch. Elektrochem.*, 1908, 14, 598—607).—The reactions between hydrogen peroxide and iodine or iodine ions are: (1) $\text{H}_2\text{O}_2 + \text{I}_2 = 2\text{H}^+ + 2\text{I}^- + \text{O}_2$ and (2) $\text{H}_2\text{O}_2 + 2\text{I}^- + 2\text{H}^+ = 2\text{H}_2\text{O} + \text{I}_2$. The first is very rapid in alkaline solutions, and the second is rapid in acid solutions; in solutions containing a suitable small quantity of hydrogen ions, the two may take place with equal velocity, and the result is then simply decomposition of hydrogen peroxide, the concentrations of the iodine and iodine ions remaining unchanged. The ratio between the quantities of iodine and iodine ions which must be present in order to make the two reactions proceed equally fast depends on the concentration of the hydrogen ions. A large number of experiments, in which the concentration of the hydrogen ions is kept constant by adding acetic acid and sodium acetate to the solutions, are made which are in complete agreement with these views.

Bredig and Walton's observations (Abstr., 1904, ii, 319) on the catalysis of hydrogen peroxide by neutral iodides are explained by the same reactions, for in this case when reaction (2) has proceeded to a very small extent, the solution becomes alkaline and reaction (1) then proceeds exceedingly fast, the stage at which the two have equal velocity is therefore attained when a very small quantity of iodine has been liberated.

T. E.

Non-existence of a Polymeride of Chlorine. E. BRINER and E. DURAND (*Zeitsch. Elektrochem.*, 1908, 14, 796—797).—The authors have investigated the effect of the silent discharge on carefully-purified chlorine at a temperature but little above its boiling point. The experimental arrangements could have detected a contraction of 1/2000 of the volume of the gas, but no change was observed. The activity of chlorine observed by Kellner (*Abstr.*, 1902, ii, 649) and Russ (*Abstr.*, 1905, ii, 381) is possibly due to ozone or oxides of chlorine.

T. E.

Absolute Density of Hydrogen Sulphide. GEORGES BAUME and F. LOUIS PÉROT (*J. Chim. Phys.*, 1908, 6, 610—619).—Hydrogen sulphide from several sources, purified by fractional distillation, was employed. The density was determined by the method already described (this vol., ii, 372), except that an oil-gauge was interposed between the gas and the mercury.

The mean value of nearly twenty experiments for the weight of a litre of the gas at 0° and 760 mm. is 1.5392 grams. From this result, the atomic weight of sulphur has been calculated by Guye's method from the critical constants. The mean result is $S = 32.070$ ($H = 1.00775$), in excellent agreement with the gravimetric determinations of Richards and Jones (*Abstr.*, 1907, ii, 685).

G. S.

Preparation of Azoimide. JOHANNES THIELE (*Ber.*, 1908, 41, 2681—2683).—Azoimide is obtained in good yield by the action of ethyl nitrite on hydrazine in presence of alkali. Hydrazine hydrate (1 mol.) is mixed with 4*N* sodium methoxide ($1\frac{1}{2}$ mols.), ethyl nitrite ($1\frac{1}{2}$ mols.), and ether, and the mixture allowed to remain, first in ice, and then at the ordinary temperature. After twenty-four hours, the sodium azoimide is collected and washed. The yield is nearly quantitative. Instead of the hydrate, hydrazine sulphate may be used; this is ground with $3\frac{1}{2}$ mols. of sodium methoxide for six hours, the sodium sulphate filtered off, and the filtrate treated with ethyl nitrite and ether. For the direct preparation of free azoimide, hydrazine sulphate is shaken for six hours with aqueous sodium hydroxide and ethyl nitrite; in this way, 80—84% of the hydrazine is converted into azoimide. Sodium azoimide is also formed by heating hydrazine hydrate with aqueous sodium nitrite, preferably, in presence of hydrazine sulphate or sodium hydroxide, but the reaction is slow and incomplete.

J. C. C.

Formation of Nitric Oxide in the High Tension Arc. FRITZ HABER and ADOLF KOENIG (*Zeitsch. Elektrochem.*, 1908, 14, 689—695).—The authors have continued their experiments (this vol., ii, 34) by passing the high tension arc through nitric oxide at about 100 mm. pressure. A platinum wire of 0.01 mm. diameter, stretched across the quartz tube in which the arc is produced, melts when the current is increased to 0.2 ampere. The temperature is therefore not much above the melting point of platinum. Using the same current and passing the gas through the tube at the same rate, the percentage of nitric oxide (about 14.5) leaving the arc is the same whether nitric oxide is used

or a mixture of equal volumes of oxygen and nitrogen. The temperature is at most some hundreds of degrees above the melting point of platinum, and the equilibrium is therefore electrical, that is, due to ionic collisions, and not thermal.

T. E.

Interaction of Nitric Oxide and Oxygen. WILHELM HOLWECH (*Zeitsch. angew. Chem.*, 1908, 21, 2131—2135).—Mandl and Russ's observations (this vol., ii, 272) suggest that nitric oxide reacts only slowly with pure oxygen, the reaction being accelerated by the presence of catalysts. As this is of great importance for the practical working up of the nitric oxide which is formed in the electric furnace, the present author has endeavoured to prepare a non-reacting mixture of nitric oxide and ozonised oxygen with the object of studying the effect on it of catalysts. The apparatus employed is figured, and the results of the experiments represented by curves. It is found that 2 vols. of nitric oxide react with 1 vol. of oxygen almost completely at the atmospheric pressure with formation of NO_2 and N_2O_4 . The velocity of the reaction, by constant volume, is approximately the same for oxygen prepared from air by Linde's method, ozonised oxygen, oxygen from barium peroxide, and oxygen from potassium dichromate and sulphuric acid.

G. Y.

Action of Nitrous Gases and Oxygen on Water. FRITZ FORSTER and M. KOCH (*Zeitsch. angew. Chem.*, 1908, 21, 2161—2172).—A résumé is given of the work of various authors on the preparation of nitric and nitrous acids from the nitric oxide formed by combustion of atmospheric nitrogen. It is pointed out that the concentration of the nitric acid formed by the action of a mixture of nitrogen dioxide and oxygen on water must reach a limit, which is a function of the velocity with which the equilibrium $2\text{NO} + \text{H}_2\text{O} \rightleftharpoons \text{HNO}_2 + \text{HNO}_3$ is reached, and, therefore, of the concentration of the nitrogen dioxide, since the lower the partial pressure of the dioxide the smaller will be the concentration of its solution in the water, and hence the velocity of its reaction with the water. On the other hand, the larger volume of undissolved gases passing through the solution will cause more rapid evaporation, in which the nitric acid takes part even at concentrations far below 68%. The maximum concentration of nitric acid which can be obtained by the action of a mixture of nitrogen dioxide and oxygen on water, must lie about this percentage, since, when solutions containing higher percentages are evaporated, the nitric acid volatilises more rapidly than the water. For the same reasons, the limit concentration must be the lower the more rapid the current of gas. These views are confirmed by the results now obtained on studying the action on water of mixtures of nitrogen dioxide with oxygen and with air in varying proportions. The apparatus employed is figured, and the results are tabulated.

The formation of nitric acid takes place fairly rapidly until the solution contains about 54% of acid, a concentration corresponding with the composition $\text{HNO}_3 \cdot 3\text{H}_2\text{O}$, when, in consequence of the greatly diminished amount of free water, the reaction becomes greatly retarded. It is found that, whilst the concentration of a 64.22% acid is raised to 67.6% by the action at 0° of a mixture containing 63.2% by volume of

nitrogen dioxide, at 60° the concentration is raised by the same mixture, passing into the nitric acid at the same rate and for the same period, only to 65.2%. The higher temperature is the more unfavourable to the reaction, which is, therefore, probably one between water, oxygen, and the bimolecular dioxide, N_2O_4 .

The influence of the partial pressure is shown in that, whilst almost the whole of the dioxide of a mixture of 2.5 vols. of nitrogen dioxide with 6.0 vols. of oxygen is absorbed by water with formation of a 37% acid, under the same conditions only 53% of the dioxide of a mixture of 2.5 vols. of dioxide and 122 vols. of oxygen is absorbed with formation of a 27.73% acid.

Whilst at low concentrations the velocity of the reaction is affected only slightly by the rate at which the gases are passed into the water, a marked effect is produced at concentrations over 50% of acid. Equal volumes of a mixture containing 5.0 vols. of dioxide and about 12 vols. of oxygen, when passed into water at the rates of 4.25, 8.5, and 17.0 litres per hour, yielded 58.78%, 55.36%, and 53.95% acids respectively. The bearing of the experimental results on the behaviour of nitrous acid also is discussed.

G. Y.

Molecular Weight and Hydrates of Hypophosphoric Acid.

ARTHUR ROSENHEIM and MAX PRITZE (*Ber.*, 1908, 41, 2708—2711).

—The controversy between Rosenheim, Stadler, and Jacobsohn (*Abstr.*, 1906, ii, 744) and Parravano and Marini (*Abstr.*, 1906, ii, 744) as to the molecular weight of hypophosphoric acid has led the authors to determine the molecular weights of the methyl and ethyl esters of pyro- and of hypo-phosphoric acids in methyl or ethyl iodide by the ebullioscopic method, with results which indicate that the formulae of the acids are $H_4P_2O_7$ and $H_4P_3O_{10}$ respectively.

The monohydrate, $H_2PO_6 \cdot H_2O$, m. p. 62°, appears to be the only hydrate stable between 0° and 60°; Joly's anhydride (*Abstr.*, 1886, 662), or Sönger's hydrate, $H_2PO_{3.2} \cdot \frac{1}{2}H_2O$, could not be obtained.

C. S.

Coagulation of [Colloidal] Arsenious Sulphide by Barium Chloride. JACQUES DUCLAUX (*J. Chim. Phys.*, 1908, 6, 592—595).—

When a colloidal solution of arsenious sulphide is precipitated by barium chloride, part of the barium is carried down with the precipitate and the remaining solution is acid. This is usually accounted for on physical lines as being due to absorption of the barium by the sulphide with consequent hydrolysis of the salt (Whitney and Ober, *Abstr.*, 1902, ii, 65), although Linder and Pictou (*Trans.*, 1895, 67, 63) showed that the sulphide usually contains excess of hydrogen sulphide, and that in the presence of barium chloride barium sulphide is formed and hydrogen chloride set free.

The author now shows that when a colloidal solution of arsenious sulphide containing excess of hydrogen sulphide, which has been kept well stoppered for five years, is precipitated with barium chloride and filtered, the filtrate contains no hydrogen sulphide, but a certain amount of arsenious acid; the latter corresponds approximately with the amount of hydrogen chloride in the filtrate, and therefore with that of the barium absorbed. The author considers that neither of the above

explanations of the phenomenon are satisfactory; it is probable that there is double decomposition between the barium chloride and the sulphide, perhaps by replacement of an AsO group existing in the sulphide by barium. G. S.

Preparation of Carbon Monoxide. ERWIN RUFF (*Chem. Zeit.*, 1908, 32, 983).—A known weight of sulphuric acid is heated in a generating flask to 100°, and an equal weight of 98% formic acid is dropped in from a stoppered funnel. A regular stream of pure carbon monoxide is thus evolved; when the action slackens, a gentle heat is again applied by means of a small flame. L. DE K.

Simple Arrangement for Filling Glass Tubes with Liquid Carbon Dioxide. ALFRED THIEL (*Chem. Zentr.*, 1908, ii, 470—471; from *Zeitsch. Chem. Appar.*, 1908, 3, 240—243).—An arrangement is described for filling evacuated glass tubes with carbon dioxide to allow of the demonstration of the critical temperature of this gas. The glass tube to be filled is placed in a cooling bath of solid carbon dioxide and ether, and is connected by a stout capillary tube to a compression tube, which is regulated by an adjustable head of mercury. Air-free carbon dioxide is admitted to the compression tube by lowering the head of mercury, when, by closing a tap on the inlet tube and opening a tap connecting with the exhausted condensing tube and increasing the head of mercury, the enclosed carbon dioxide is transferred to the cooled tube, where it is condensed. By repeating this operation several times, any required quantity of carbon dioxide may be condensed in an expeditious manner. J. V. E.

Argon in Radioactive Zirconium Minerals. A. VON ANTROPOFF (*Zeitsch. Elektrochem.*, 1908, 14, 585—586).—The gas extracted from a feebly radioactive Brazilian mineral containing 97% of zirconia consisted mainly of carbon dioxide with smaller quantities of hydrogen and nitrogen and traces of helium and argon. This is the second mineral in which argon has been found; the first was also a radioactive zirconium compound (*Trans.*, 1906, 89, 1568). T. E.

Analysis of the Atmospheric Gases Non-liquefiable in Liquid Air. FRÉD BORDAS and TOUPLAIN (*Compt. rend.*, 1908, 147, 591—594).—A modified form of the apparatus described previously (this vol., ii, 430) has been employed for the analysis of the gases which escape liquefaction when liquid air is distilled and the oxygen and nitrogen condensed. A table is given of the wave-lengths of the lines observed in the spectrum of this gas after removal of all the oxygen and nitrogen. This includes, besides those observed by Baly for neon and helium, the red lines of wave-lengths 7267, 7050, 6943, 6732, 6610, 6572, 6535, 6509; the orange lines, 5905, 5890; the yellow lines, 5820, 5808, 5765, and the green lines, 5750, 5722, 5694, 5659, 5569, 5441, 5407, 5348, 5336, which the authors attribute to neon, but which have not been observed previously.

The conclusion is drawn that the gases in the atmosphere non-liquefiable in liquid air consist of neon and helium. E. H.

Liquefaction of Helium. H. KAMERLINGH ONNES (*Proc. K. Akad. Wetensch. Amsterdam*, 1908, 11, 168—185; *Compt. rend.*, 1908, 147, 421—424).—The actual work carried out with the object of liquefying helium was preceded by a study of the isothermal lines for such temperatures as can be attained by the use of liquid hydrogen. The results of this study made it very probable that the Joule-Kelvin effect would not only give a decided cooling at the melting point of hydrogen, but that this would be sufficient to make a Linde-Hampson process successful. The construction of the helium liquefier was therefore an imitation of the hydrogen liquefier described in a previous communication.

The helium employed was obtained by heating monazite sand. The gas was then successively exploded with oxygen, cooled with liquid air, compressed, and led over charcoal at the temperature of liquid air. It was then passed through a column of hot copper oxide, compressed over charcoal at the temperature of liquid air, and further led over charcoal under pressure at the temperature of liquid hydrogen, until the gas which had been absorbed in the charcoal and then separately collected no longer contained any appreciable impurity.

On the day before the final experiment, 75 litres of liquid air were prepared, and on the day itself, operations began with the preparation of 20 litres of liquid hydrogen. When the helium (200 litres) had been circulating in the liquefier for about three hours, more than 60 c.c. of liquid helium was obtained. In consequence of the extreme purity of the helium, and by virtue of the special contrivances adopted, the apparatus remained perfectly transparent during the whole experiment.

The liquid helium looks as if it was almost at its critical temperature, and its surface stands out like the edge of a knife against the glass. Evaporation under diminished pressure did not lead to solidification, and the triple point pressure is certainly below 1 cm. The temperature reached in this evaporation was probably about 3° absolute.

The boiling point was found to be 4.3° absolute, but a slight correction is suggested which would make it about 4.5°. The density of the liquid is 0.15; the ratio of the density of the vapour to that of the liquid is 1:11 at the boiling point, indicating that the critical temperature is not much higher than 5° absolute, and that the critical pressure is not much more than 2.3 atmospheres.

The value of a , the constant of van der Waals' equation, appears for helium to be about 0.00005, and the value of b is probably about double the value which was expected (0.0005). J. C. P.

Preparation of Colourless Alcoholic Potassium Hydroxide ADOLF HALLA (*Chem. Zeit.*, 1908, 32, 890).—Thirty grams of pure stick potassium hydroxide are placed in a bottle with one litre of 95° alcohol, and left at atmospheric temperature until solution is effected the bottle being shaken from time to time. The clear supernatant liquid is then carefully siphoned off into another bottle, which is stoppered and exposed to diffused daylight. The solution is thereby

bleached in the course of a few days, and remains colourless so long as it is kept in diffused daylight. P. H.

The Partition of Silver between Zinc and Lead. G. N. POTDAR (*J. Coll. Sci. Tokyo*, 1908, 25, ix, 1—13. Compare Wright and Thompson, *Abstr.*, 1890, 336).—Silver-lead alloys were melted with zinc in an atmosphere of carbon dioxide, the temperature being maintained at 540° by means of a bath of boiling phosphoric sulphide. After stirring, the mass was allowed to remain fluid for five and a-half hours, rapidly cooled, and the silver in the two solidified layers estimated. The whole of the zinc layer has to be taken for analysis, as the distribution of zinc in it is far from uniform, owing perhaps to segregation during cooling. At 540° , silver is about 300 times more soluble in zinc than in lead, and this partition-coefficient is practically independent of the concentration of the silver.

In Parkes' process for the desilverisation of lead, the solid zinc scum is removed at $325\text{--}360^{\circ}$. Experiments at this temperature indicate that the removal of silver by the zinc is practically complete, the partition-coefficient at 358° varying in three trials from 1300 to 5700. C. H. D.

The Silver Hydrogel in Photographic Films. LÜPPO-CHAMER (*Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 135—136).—The peculiarities of the silver deposits obtained with different developers, and with gelatin or collodion films, are explained by the more or less completely colloidal nature of the silver, and by adsorption of different substances from the developers (compare this vol., ii, 841). T. E.

Use of Metallic Deposits in Metallography. II. FEDERICO GIOLITTI (*Gazzetta*, 1908, 38, ii, 352—357).—The author has applied the method devised by him (*Abstr.*, 1906, ii, 759) to the qualitative study of alloys constituted of solid solutions. When a polished surface of a binary alloy containing mixed crystals either of two metals or of one of them and a compound of the two is immersed in a solution containing ions of the more electronegative or more noble of the two metals, differences of potential are established between the various portions of the surface. The cations of the solution will be deposited in the metallic state on the different parts of the section with a velocity increasing with the concentration of the more electronegative metal. By varying the concentration of the solution and the duration of immersion, or by observing the section under the microscope, the gradual and continuous variations of the metallic deposit on that part of the surface occupied by the mixed crystals can be followed. These variations, which correspond with differences in the concentration of the more noble metal in the mixed crystals, give an immediate indication that the constituent in question is a solid solution, and also permit the observer to judge the heterogeneity of concentration of this solid solution. Various bronzes have been studied in this way, microphotographs of the different sections after treatment with chromic oxide or with copper sulphate solution being given. T. H. P.

Magnesium Oxychloride Formed by Electrolysis of the Residual Solutions from the Manufacture of Potassium Chloride, and its Importance for the Preparation of Bromine by Kossuth and Mehns's Method. HANS HOF (*Chem. Zeit.*, 1908, 32, 993).—It has been found that the yield of free bromine, obtained by electrolysis of the residual solutions from the manufacture of potassium chloride, increases with the concentration of the solution electrolysed. On dilution with water, the electrolysed solution containing free bromine becomes gradually less yellow, and finally colourless, when the solution is found to contain only combined bromine; this may be again liberated by sulphuric acid. If the bromine is first removed by means of an organic solvent, the electrolysed solution, on dilution, becomes alkaline and opaque, in consequence of the separation of magnesium hydroxide. It is considered that magnesium hydroxide, formed during the electrolysis, remains dissolved in the concentrated magnesium chloride solution, forming a basic salt. This is decomposed by water with liberation of magnesium hydroxide, which then reacts with the free bromine. In agreement with this, analytical figures are given, showing that the proportion of bromine present as bromate to the free bromine increases with the dilution of the electrolysed solution.

By electrolysis of a concentrated solution of magnesium chloride, the author has obtained a neutral solution which does not react with bromine. When diluted, it becomes alkaline, and deposits magnesium hydroxide. The concentrated solution slowly, deposits a white, amorphous mass, $\text{MgCl}_2 \cdot 5\text{MgO}$ (Bender, *Annalen*, 1871, 159, 341; Davis, *Chem News*, 1872, 25, 258), which is stable at 160° and yields magnesium chloride when treated with cold water, but is completely decomposed only by boiling water. G. Y.

Electrolytic Oxidation of Copper. F. SCHMIEDT (*Chem. Zentr.*, 1908, ii, 386; from *Elektrochem. Zeitsch.*, 1908, 15, 53—56).—The author has repeated the work of Müller and Spitzer (*Abstr.*, 1907, ii, 174), and finds that, besides cupric oxide and copper peroxide, there is also formed cuprous oxide, which, however, becomes decomposed by the hydrogen peroxide that is also produced. Copper peroxide is formed in largest quantities at the beginning of the electrolysis, when the temperature is low. J. V. E.

Alloys of Copper and Tin. FEDERICO GIOLITTI and G. TAVANTI (*Gazzetta*, 1908, 38, ii, 209—239).—The results obtained by the authors in studying the freezing points and microscopic appearance of the copper-tin alloys agree, in general, with those of Heycock and Neville (*Abstr.*, 1901, ii, 508; 1902, ii, 261). The freezing-point diagram of these alloys is divided clearly into two parts, the first comprising alloys containing from 0 to 38.34% of tin, and the second, those containing more than 38.34% of tin. Thus the diagram is a complex one, resulting from the combination of the equilibrium diagrams of $\text{Cu-Cu}_3\text{Sn}$ and $\text{Cu}_3\text{Sn-Sn}$. The diagram is discussed in detail. T. H. P.

Copper and Iron Salts in Presence of Alkalis and Acids. HERMANN FRISCHER (*Chem. Zeit.*, 1908, 32, 1005—1006).—Experiments are described to show that the action of sodium hydroxide on a mixture of ferrous and cupric sulphates takes place, contrary to Millberg's supposition (*Chem. Zeit.*, 1906, 30, 511; 1907, 31, 1143), according to the following equations: (1) $2\text{CuSO}_4 + 4\text{NaHO} = 2\text{Cu}(\text{OH})_2 + 2\text{Na}_2\text{SO}_4$, and (2) $2\text{FeSO}_4 + 2\text{Cu}(\text{OH})_2 = \text{Fe}_2(\text{OH})_4\text{SO}_4 + \text{Cu}_2\text{SO}$. The action of air on the resulting mixture leads to the formation of ferric hydroxide and cupric sulphate, the whole reaction being represented by the equation: $2\text{FeSO}_4 + 2\text{CuSO}_4 + 4\text{NaHO} + \text{H}_2\text{O} + \text{O} = 2\text{Fe}(\text{OH})_3 + 2\text{CuSO}_4 + 2\text{Na}_2\text{SO}_4$. Any further addition of alkali must result in precipitation of copper hydroxide. As the equation shows, the copper sulphate acts as the oxygen carrier; in agreement with this view, if potassium sodium tartrate and an excess of alkali are added to the mixture of ferrous and cupric salts, cuprous hydroxide is precipitated in the cold, and on heating is converted into the red anhydride, whilst the ferric salt remains in solution. If a sufficient excess of ferrous salt is present, the cuprous hydroxide is reduced to metallic copper. This reaction may be employed for the detection of ferrous salts.

If a ferrous salt is added to an ammoniacal solution of a cupric salt, ferric hydroxide is precipitated, whilst the blue colour of the solution gradually disappears; the cuprous salt remaining in solution is rapidly oxidised by air. In this case, also, the precipitation of the ferric hydroxide may be prevented by addition of a tartrate or a citrate.

The behaviour of copper and iron salts in presence of ammonia affords a ready means of preparing cuprous solutions for the absorption of carbon monoxide in gas analysis. It is evident, moreover, that, in the separation of iron and copper by means of ammonia, a preliminary oxidation of ferrous salts is unnecessary if the amount of copper present is equal to, or greater than, that of the iron. On the other hand, if the copper is to be estimated colorimetrically, the ferrous salts present must first be oxidised.

In acid solution, cuprous salts are oxidised at the expense of ferric salts, according to the equation: $\text{Cu}_2\text{O} + \text{Fe}_2\text{O}_3 = 2\text{CuO} + 2\text{FeO}$.

G. Y.

Equilibrium in the Reaction between Lead Sulphide and Its Oxidation Products. III. RUDOLF SCHENCK and W. RASSBRACH (*Ber.*, 1908, 41, 2917—2925).—Previous investigations (Abstr., 1907, ii, 546, 619) have shown that the metallurgically important reactions: (I) $\text{PbS} + \text{PbSO}_4 = 2\text{Pb} + 2\text{SO}_2$; (II) $\text{PbS} + 2\text{PbO} = 3\text{Pb} + \text{SO}_2$, are reversible, the equilibrium being conditioned by a definite pressure of the sulphur dioxide, which is dependent on the temperature only. In addition to the two temperature-pressure curves so obtained, a third was indicated, the cause of which forms the main object of the present investigation. The result shows that a basic sulphate, $\text{PbSO}_4 \cdot \text{PbO}$, is formed, which, setting up its own reversible reaction, $2[\text{PbSO}_4 \cdot \text{PbO}] + \text{PbS} \rightleftharpoons 7\text{Pb} + 5\text{SO}_2$, accounts for the existence of the third temperature-pressure curve. These three curves divide the whole temperature-pressure diagram into four fields. The final product of all reactions in the first field is lead sulphate, in the second the basic sulphate, and in

the third lead oxide; these three stable phases do not evolve sulphur dioxide with lead sulphide. In the fourth field, no compound containing oxygen is stable with lead sulphide, an impure metal being obtained with evolution of sulphur dioxide. These conclusions are deduced from observations at temperatures below 820° ; above this temperature, complications are introduced, owing to the mutual solubility of lead oxide and lead sulphate.

The existence of the basic sulphate, $\text{PbSO}_4 \cdot \text{PbO}$, is proved as follows. Mixtures of lead sulphate and lead oxide in known proportions are heated to 1020° , and allowed to cool. The freezing-point curve, consisting of many branches, indicates the existence of many compounds of lead sulphate and lead oxide which do not form mixed crystals with one another or with either of the components. Distinct maxima are observed at two points: (966° , 40% PbO) and (951° , 61.5% PbO); the compositions of the mixture at these points correspond with the formulae $\text{PbSO}_4 \cdot \text{PbO}$ and $\text{PbSO}_4 \cdot 2\text{PbO}$ respectively. The existence of a third basic sulphate, $\text{PbSO}_4 \cdot 3\text{PbO}$, is indicated by the curve, which, however, is only stable below 880° ; above this temperature, it passes into $\text{PbSO}_4 \cdot 2\text{PbO}$. The presence of these basic sulphates in the fused masses containing 40–70% lead oxide is indicated by the appearance of long, transparent needles. The only basic sulphate giving in the presence of lead sulphide and a little lead a well-defined temperature-pressure curve is $\text{PbSO}_4 \cdot \text{PbO}$, as already mentioned; the others react too slowly for any trustworthy data to be obtained.

The following facts have been observed during the investigation. Lead sulphate does not melt below 1100° (compare Ramsay and Eumorfopoulos, *Phil. Mag.*, 1896, [v], 41, 360); an exact determination cannot be made, owing to dissociation into sulphur trioxide. Pure lead sulphate shows a transition point at 850° . Mixtures of lead oxide and sulphate, rich in the former, change in volume at the ordinary temperature, the original dense mass swelling up and crumbling to a coarse powder, in which scales of lead oxide can be detected. The force exerted during the expansion distorted the containing platinum crucible. C. S.

Compounds of Lead with Nitrous Acid. ALBERTO CHILLESOTTI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 173–183, 288–295. Compare this vol., ii, 845).—By measuring the *E.M.F.* of cells consisting of two lead electrodes, one immersed in a solution of a lead salt containing a known concentration of lead ions, and the other in a 0.1*N* lead nitrite solution, it is found that the concentration of the lead ions in the latter is very nearly equal to their concentration in a lead chloride solution of corresponding concentration (compare Abegg and Lahendzinski, *Abstr.*, 1904, ii, 241). The lower conductivity of lead nitrite solutions, compared with those of lead chloride, is hence due, not to a less degree of dissociation (*loc. cit.*), but to a difference in the mobility of the complex ions.

The conductivity of lead nitrite solutions undergoes a gradual increase, owing to decomposition of the nitrite according to the equation: $3\text{Pb}(\text{NO}_2)_2 + 2\text{H}_2\text{O} = \text{Pb}(\text{NO}_3)_2 + 2\text{Pb}(\text{OH})_2 + 4\text{NO}$; probably a small amount of secondary decomposition occurs with evolution of

nitrous oxide. The solutions examined, after boiling and cooling, deposit nacreous scales of $\text{Pb}(\text{NO}_2)_2 \cdot \text{Pb}(\text{OH})_2 \cdot \text{H}_2\text{O}$ or $\text{Pb}(\text{NO}_2)_2 \cdot \text{Pb}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Attempts to prepare a double nitrite of lead and potassium by mixing hot concentrated solutions of lead acetate and potassium nitrite in various proportions led, in all cases, to crystalline compounds, in which the ratio $\text{Pb} : \text{NO}_2$ lies between 1:3 and 1:4; the excess of lead oxide present is due probably to decomposition of the lead nitrite.

By the gradual addition of freshly precipitated and washed lead hydroxide to a boiling 30% solution of the double nitrite,

the author has prepared the basic lead nitrite, $\text{Pb}(\text{NO}_2)_2 \cdot \text{Pb}(\text{OH})_2 \cdot \text{H}_2\text{O}$, which can be obtained in the pure, non-hydrolysed condition by gently warming the impure product with a cold saturated, crude solution of the salt, and allowing to crystallise. Under certain conditions, this basic salt separates in the form $\text{Pb}(\text{NO}_2)_2 \cdot \text{Pb}(\text{OH})_2$. Study of the action of lead on a lead nitrate solution leads to the confirmation of the existence of the compound $4\text{PbO} \cdot \text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$, prepared by Chevreul (*Ann. Chim.*, 1812, 83, 72) and others.

T. H. P.

Coagulation of Colloidal Aluminium Hydroxide by Electrolytes. SHIN-ICHI KAWAMURA (*J. Coll. Sci. Tôkyô*, 1908, 25, viii, 1—29).—It has been found possible to determine the degree of coagulation of a colloidal solution of aluminium hydroxide, produced by various electrolytes, by measuring the viscosities of the solutions. The general relations found are not affected to any marked degree by the temperature, concentration of the colloidal solution, or duration of the experiment, and may be summarised as follows: (1) In those cases where coagulation occurs, the relative viscosity shows a marked rise only when the concentration of the electrolytes reaches certain values. From this point, the viscosity increases with the increasing concentration of the electrolyte to a certain limit, and then ceases to be influenced by the further addition of the electrolyte. In some cases, the degree of coagulation increases suddenly, and in others, more gradually, with the increasing concentration of the electrolyte. (2) The colloidal solution of aluminium hydroxide shows anodic cathaphoresis; consequently, in accordance with Hardy's rule (compare Abstr., 1899, ii, 567; 1903, ii, 469; 1906, i, 121), only anions are found to exercise coagulating power. (3) With but few exceptions, the coagulating power of an electrolyte increases rapidly with the increasing valency of the anion; this is in agreement with Schulze's rule (compare Abstr., 1883, 295). (4) The highest degree of coagulation produced by various electrolytes differs considerably in different cases, and appears to be a characteristic of the electrolyte.

W. H. G.

Crystallised Iron from a Foundry at Teschen, Austria. FELIX CORNU (*Centr. Min.*, 1908, 545—546).—The crystals are about 3 mm. across, and have the form of distorted octahedra grouped along

the three cubic axes (similar to the well-known skeletal growths of magnetite). Anal. I of the crystals, and II of the ground mass of iron in which they are embedded.

Nature of the Pseudo-solutions of Ferric Hydroxide. III. FEDERICO GIOLITTI (*Gazzetta*, 1908, 38, ii, 252—258. Compare Abstr., 1906, ii, 857).—The typical or stable ferric hydrosol, prepared by treating washed precipitated ferric hydroxide with acetic acid after keeping it in contact with water for several months and dissolving in water the residue insoluble in acetic acid, is either a ferric hydroxide containing less water than the other hydrosols and the ordinary gelatinous hydroxide, or possibly anhydrous ferric oxide; the latter view is supported by the comparative difficulty with which this hydrosol is dissolved by acids. The hydrosol of Graham, prepared by dialysis, also changes gradually into the stable hydrosol.

T. H. P.

Iodopentamminecobalt Salts. ALFRED WERNER (*Ber.*, 1908, 41, 3007—3015).—The author finds that the substances obtained by Sand and Böckmann (this vol., ii, 44) by the action of iodine on the black nitrosopentamminecobalt salts, to which they ascribe the constitution of a complex metal ammonia containing cobalt atoms with co-ordination numbers 7 and 8, are, in reality, members of the hitherto unknown series of iodopentamminecobalt salts. For example, the product of the action of iodine on black nitrosopentamminecobalt nitrate is a mixture of *iodopentamminecobalt nitrate*,

with a little xantho-nitrate; the separation of the two is effected through the dichromates. By treatment with silver nitrate, the former yields aquopentamminecobalt nitrate, thus proving its constitution.

Members of the new series are readily obtained by heating aquopentamminecobalt iodide at 80°. Water is evolved, and the brown product, triturated with ammonium nitrate, yields iodopentamminecobalt nitrate. The *chloride*, *bromide*, *iodide*, and *dichromate* are described; they all have a green colour.

C. S.

Relationships between Nickel and Hydrogen. M. MAYER and V. ALTMAYER (*Ber.*, 1908, 41, 3062—3074).—The absorption of hydrogen by reduced nickel has been studied at temperatures between 360° and 560°, and at pressures between 1/15 and 4/5 of an atmosphere. The metal was obtained by the same method as was used by Sieverts (Abstr., 1907, ii, 741), but the conditions of absorption were different, as only small amounts (2.7 grams) of metal were used, and each experiment was allowed to proceed until equilibrium was attained. The amount of gas absorbed was much greater than in Sievert's experiments; thus at pressures between 1/15 and 4/5 of an

atmosphere, and a temperature of 360° , 1 vol. of the metal absorbs 5.5–50 volumes of gas. The isotherms representing the relationship between the pressure of the hydrogen and the relative number of atoms of hydrogen absorbed, are straight lines; thus indicating that Henry's law holds good, and that the system nickel-hydrogen is bivalent.

The rapidity with which equilibrium is established varies considerably with the amount of hydrogen present.

The solubility coefficient, that is, the ratio weight of absorbed hydrogen in 1 litre of nickel/weight of hydrogen in 1 litre of the gas volume, varies with the temperature.

Decomposition of Chromic Acid by Hydrogen Peroxide

ERNST H. RIESENFELD and ALFRED WESCH (*Ber.*, 1908, 41, 2826–2835. Compare Abstr., 1905, ii, 825).—The decomposition of chromic acid by hydrogen peroxide was measured in presence of a varying excess of chromic acid. In spite of an excess of from one to one hundred times the theoretical, the amount of oxygen evolved remained constant, averaging 1.94 atoms per molecule of hydrogen peroxide. Decomposition of chromic acid in presence of excess of hydrogen peroxide and increasing amounts of sulphuric acid showed that up to a certain point the reaction remained unchanged, 1 atom of chromium corresponding with about 4.7 atoms of oxygen. Above 2.5*N* acid, a strength known to react with hydrogen peroxide to form Caro's acid, more oxygen than 5 atoms is evolved, due to a decomposition of the Caro's acid in presence of chromic salts. When the same change is studied in presence of excess of chromic acid, it is found to be far less dependent on the amount of sulphuric acid. Above 2.5*N*, Caro's acid is formed as before, with the result that slightly less hydrogen peroxide is available, and accordingly less oxygen than 2 atoms is liberated. The concentration of the sulphuric acid when chromic acid solution is dropped into hydrogen peroxide is thus without influence, and perchromic acid, H_2CrO_5 , is formed; likewise, when hydrogen peroxide is dropped into excess of a mixture of potassium dichromate and sulphuric acid, the excess of chromic acid is without influence.

Spitalsky's views (Abstr., 1907, ii, 338, 942) are adversely criticised.

E. F. A.

Preparation of Uranium. FEDERICO GIOLITTI and G. TAVANTI (*Gazzetta*, 1908, 38, ii, 239–251).—The authors have investigated the various methods of preparing uranium.

The "pure uranyl acetate" of Kahlbaum or Merck is, in reality, a double sodium uranyl acetate, $\text{UO}_2(\text{OAc})_2 \cdot \text{NaOAc} \cdot 2\text{H}_2\text{O}$, which, on ignition, yields sodium pyrouanate, $\text{Na}_2\text{U}_2\text{O}_7$, as sole product; the latter is also obtained by igniting other uranyl salts of volatile acids containing salts of the alkali metals. When sodium pyrouanate is

heated to redness in a current of hydrogen, it is reduced according to the following equation: $\text{Na}_2\text{U}_2\text{O}_7 + 2\text{H}_2 = 2\text{NaOH} + 2\text{UO}_2 + \text{H}_2\text{O}$, but it is found to be impossible to remove the sodium hydroxide by washing with water.

The oxide, U_3O_8 , can be obtained pure as follows: A solution of sodium uranyl acetate (100 grams) in a mixture of water (4 litres) and hydrochloric acid (50 c.c.) is precipitated by means of concentrated ammonia solution (300 c.c.), the precipitate being washed ten times by decantation with 8–10 litres of 2% ammonium chloride solution. The precipitate is then re-dissolved in hydrochloric acid, precipitated by means of ammonia solution, and washed as before, these operations being afterwards repeated a third time. On calcining the final precipitate, pure U_3O_8 , free from alkali, is obtained.

When a mixture of this oxide with excess of powdered aluminium is thrown on to the surface of fused aluminium maintained at a vivid red heat, not alloys of aluminium and uranium, mixed with alumina as stated by Moissan (Abstr., 1906, ii, 601), but a mixture of uranous oxide, alumina, and aluminium are obtained. When, however, a mixture of ferric oxide with 10% of the oxide, U_3O_8 , is intimately mixed with more than sufficient aluminium filings to reduce both the oxides, and the reaction started by means of barium peroxide and aluminium, the oxide of uranium is reduced to metallic uranium.

T. H. P.

New Element in Thorianite. MASATAKA OGAWA (*J. Coll. Sci. Tôkyô*, 1908, 25, xv, 1–11).—A new element, which it is proposed to name *nipponium* (Np), has been isolated from thorianite, reinite, and molybdenite. Its equivalent weight is about 50 and atomic weight about 100, so that this element probably fills the gap between molybdenum and ruthenium. Two *oxides* of the element appear to exist; the higher oxide is an acidic oxide, and is reduced by zinc and hydrochloric acid to the basic oxide; the latter oxide, which in the ordinary course of analysis accompanies aluminium oxide, is separated from this by conversion into a difficultly volatile chloride by heating in a current of chlorine and carbon tetrachloride vapour. The anhydrous *chloride* so formed dissolves in water to a pale green solution, and gives a characteristic line, having a wave-length of 4882, together with two other feebler lines, in the greenish-blue part of the spectrum. The *hydroxide*, precipitated by ammonia in the presence of ammonium chloride, is almost white with a pale yellow tinge, and dissolves in alkalis; it becomes nearly black when dried at 100°. The ignited oxide is brown, and is insoluble in acids. The yellowish-green solution of the hydroxide in hydrochloric acid gives a brown precipitate when boiled with sodium thiosulphate, and a greenish-black precipitate with ammonium sulphide. A solution of the chloride acidified with acetic acid gives a yellowish-brown precipitate with potassium chromate. A brown precipitate is obtained by passing carbon dioxide into a solution of the green mass formed by fusing the oxide with sodium carbonate and potassium nitrate; it dissolves readily in dilute hydrochloric acid. The aqueous solution of the fused mass does not yield a precipitate with ammonia or ammonium

sulphide, but the addition of acid to the solution containing ammonium sulphide produces a brown precipitate. W. H. G.

New Element Allied to Molybdenum. MASATAKA OGAWA (*J. Coll. Sci. Tokyo*, 1908, 25, xvi, 1—13).—Both molybdenite and thorianite contain a new element, closely allied to molybdenum, which is probably identical with the new tin-group element recently described by Miss Evans (*Trans.*, 1908, 93, 666). The equivalent of the element is about 16.7. It appears to form two oxides; the higher oxide resembles molybdenum trioxide, and yields *barium*, *lead*, and *silver* salts similar to the corresponding molybdates; the *mercurous* salt, however, forms golden-yellow crystals; the hydrated lower oxide (I) has a graphitic appearance, and is insoluble in hot dilute hydrochloric acid. The oxides are reduced by hydrogen to the *metal*, which is non-fusible at a red heat; it burns brilliantly in the air, forming the higher oxide. The new element differs from molybdenum in that it is soluble in hot concentrated hydrochloric acid, and gives no colour reaction when its higher oxide is reduced with zinc and hydrochloric acid, either in the presence or absence of potassium thiocyanate.

Thorianite appears to contain, in addition to this new element and nipponium (compare preceding abstract), yet another new element, the oxide of which is radioactive, and dissolves in nitric acid to a bluish-green solution. W. H. G.

A New Form of "Tin Plague." RUDOLF VON HASSLINGER (*Monatsh.*, 1908, 29, 787—790. Compare Cohen, *Abstr.*, 1900, ii, 212; this vol., ii, 858).—A tinned iron vessel, which had been for two years at 16—45°, showed a crystalline, brittle surface. Other masses of tin, inoculated with small portions of the crystalline tin, underwent the same change, the area affected increasing in diameter 3 to 5 mm. daily. No difference between experiments at 7°, 19°, and 37° could be noted. When tin-foil was inoculated, the change extended through the thickness of the foil. The crystalline tin preserves its appearance up to near the melting point, but becomes normal after melting and again solidifying. C. H. D.

Reduction of Vanadic Acid by Potassium Iodide. T. WARYSKI and B. MDIVANI (*Chem. Zentr.*, 1908, ii, 763; from *Mon. Sci.*, 1908, 22, [ii], 527—528).—With the object of ascertaining whether the reducing power of potassium iodide in an acid medium is dependent on the electrolytic dissociation of the acid employed, comparable tests have been made, using acetic acid and mono-, di-, and tri-chloroacetic acids. It is found that reduction is effected most readily in the presence of trichloroacetic acid, and least readily in presence of acetic acid. With trichloroacetic acid, the reduction proceeds quantitatively to the tetroxide, and admits of the estimation of vanadic acid by this method. J. V. E.

The Series Sodium Thioantimonate, Sodium Thiosulphate, and Water. A. D. DONK (*Chem. Weekblad*, 1908, 5, 767—771).—From mixtures of sodium thioantimonate and sodium thiosulphate in aqueous

solution at 0° and 30°, the following hydrated salts have been isolated: $\text{Na}_3\text{SbS}_4 \cdot 9\text{H}_2\text{O}$; $\text{Na}_3\text{SbS}_4 \cdot 9\text{H}_2\text{O} \cdot \text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$; $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

A. J. W.

Passivity of Platinum. RUDOLF RUEB (*Zeitsch. Elektrochem.*, 1908, 14, 633—634. Compare this vol., ii, 601).—Two platinum anodes in series were placed in 6% and 50% sulphuric acid respectively; after twelve hours their positions were interchanged, and this was continued for seven days; each anode lost 0.7 mg. When the anodes were not moved, they each lost 0.1 mg. In the first experiment, the cathode in the 50% acid gained 1.1 mg.; hence the coating formed in the 6% acid dissolves in the strong acid. If an invisible skin of oxide forms on an anode in the strong acid, it is therefore not the same oxide as that produced in the weak acid.

T. E.

Mineralogical Chemistry.

Coloration of Minerals. KARL SIMON (*Jahrb. Min.*, 1908, *Beil.-Bd.*, 26, 249—295).—A review is given of the literature, and experiments made on the coloration of zircon, amethyst, smoky-quartz, tourmaline, and topaz. These minerals are all decolorised when strongly heated in an atmosphere of either hydrogen or oxygen, and the temperature at which the colour is lost depends to some extent on the size of the fragments. The colour is restored on exposing the mineral to sunlight, or to the emanations of radium. The colouring matter is in each case probably inorganic, but its exact nature is unknown.

L. J. S.

Relations between Quartz, Chalcedony, and Opal. HANS LEITMEIER (*Centr. Min.*, 1908, 632—638).—The following minerals, in a state of moderately fine powder, were heated with a 50% solution of potassium hydroxide at 80° for five hours; the residue was washed with a 50% solution of potassium hydroxide before being washed with water (otherwise some of the dissolved silica is re-precipitated), and the amount of silica in solution was determined:

	Sp. gr.	Water lost at 80°.	Water lost on ignition.	Silica dissolved.
Quartz from Rauris	2.613	—	(0.22%)	7.23%
Chalcedony from Weitendorf	2.608	—	1.50	76.02
" " " dehydrated	—	—	—	53.10
Chalcedony from Faroe	2.591	0.10%	1.02	42.30
Cacholong " "	2.370	0.25	1.35	54.40
Opal (Hyalite) from Bohemia	2.177	0.34	3.04	56.63
Opal (precious), New South Wales	2.121	2.40	6.23	100.00
" " " dehydrated	—	—	—	82.34

Hot water acting for twelve hours on precious opal gelatinises the surface and dissolves 0.22%. It is concluded that chalcedony and

quartz are varieties of the same mineral species, and that chalcedony does not contain any admixed opal.

L. J. S.

The Reversible Alteration of Cryolite. FELIX CORNU (*Centr. Min.*, 1908, 546—547).—R. NACKEN (*Centr. Min.*, 1908, 38) has observed the change of monoclinic cryolite to a cubic modification at a temperature of 550—570°. The suggestion is made that this cubic modification ($\text{Na}_6\text{Al}_2\text{F}_{12}$) is isomorphous with cryolithionite ($\text{Li}_3\text{Na}_3\text{Al}_2\text{F}_{12}$) (*Abstr.*, 1904, ii, 347).

L. J. S.

Origin of the Boric Acid in the Soffioni of Tuscany. GIOVANNI D'ACHIARDI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 238—239).—A reply to Nasini (compare this vol., ii, 862).

T. H. P.

Manganese and Iron Minerals from the Crystalline Schists, of Broșteni, Roumania. VASILE C. BUTUREANU (*Ann. Sci. Univ. Jassy*, 1908, 5, 87—108).—Fifteen analyses are given of "brostenite" (*Abstr.*, 1901, ii, 26); they exhibit wide variations, indicating that the material is not homogeneous. Analyses are also given of wad, and a manganese and iron carbonate.

L. J. S.

Vorobyevite and the Chemical Structure of Beryls. WLADIMIR I. VERNADSKY (*Bull. Acad. Sci. Petersburg*, 1908, 975—976).—The author describes a beryl containing caesium, to which he gives the name *vorobyevite*. From the best published analyses, the conclusion is drawn that the beryls constitute a class of minerals by themselves. Various members of this class are known, having the composition: $p\text{-GlAl}_2\text{SiO}_{12}.qA$, where A is GfH_2SiO_4 , $\text{GfSiO}_3(t)$, Cs_2SiO_3 , Li_2SiO_3 , or Na_2SiO_3 . In beryls not containing alkali metals, the compound $2\text{GlAl}_2\text{Si}_4\text{O}_{12}(\text{GfSiO}_3)_4(\text{GfH}_2\text{SiO}_4)$ predominates. Vorobyevite contains 4.65—10.4% of a caesium compound of the type $\text{GlAl}_2\text{Si}_4\text{O}_{12}(\text{GfH}_2\text{SiO}_4)(\text{Cs}_2\text{SiO}_3)$.

T. H. P.

Analysis of the Microcline from the Pegmatites of Mesvres. PHILIPPE BARBIER (*Bull. Soc. chim.*, 1908, [iv], 3, 821—822).—The pegmatites of the Mesvres valley contain a beautiful slightly translucent, laminated, milk-white, or pink microcline. The author has analysed specimens of this mineral collected at Mesvres, and obtained the following results. An analysis by Damour of specimens of the same microcline found at Broye is given for comparison:

	SiO_2 .	Al_2O_3 .	K_2O .	Na_2O .	Total.
I. Mesvres . . .	66.12	19.11	10.54	4.12	99.93
II. „	66.13	19.09	10.62	4.12	99.96
III. Broye . . .	64.80	19.90	12.11	2.10	98.91

E. H.

Analysis of the Christianite of Simiouse. PHILIPPE BARBIER (*Bull. Soc. chim.*, 1908, [iv], 3, 822—823).—The cavities in a basalt of Mt. Simiouse, near Montbrison, contain microscopic crystals of christianite and other minerals. The christianite gave on analysis:

SiO ₂	Al ₂ O ₃	CaO.	K ₂ O.	Na ₂ O.	BaO, MgO.	Loss on ignition.	Total.
52.10	18.33	4.96	6.89	1.12	traces	16.55	99.95

This mineral thus corresponds closely with the formula
 $\text{Si}_5\text{O}_{14}\text{Al}_3(\text{K}, \text{Ca}) + 5\text{H}_2\text{O}.$

E. H.

Aloisiite: a New Hydrosilicate from the Tufa of Fort Portal (Uganda). LUIGI COLOMBA (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 233—238).—The silicate contained in the tufa of Fort Portal is of a type extremely poor in silica, and after deducting admixed calcium carbonate and gangue, has the following composition:

SiO ₂	FeO.	CaO.	MgO.	Na ₂ O.	H ₂ O.	Total.
24.52	20.56	26.50	11.08	9.96	6.95	99.57

These numbers correspond approximately with the formula $(\text{R}'\text{R}'_2)\text{SiO}_6$, where $\text{R}'\text{O}$ is CaO , FeO , MgO , and $\text{R}'_2\text{O}$ is $\text{Na}_2\text{O}, \text{H}_2\text{O}$. The author gives to this silicate the name *aloisiite*; it occurs also in an altered form in the tufa.

T. H. P.

Formation of Kaolin. OTTO HÄHNEL (*J. pr. Chem.*, 1908, [ii], 78, 280—294).—Analyses of a fresh (I), an effloresced (II), and a half-kaolinised porphyrite show that the processes of efflorescence and kaolinisation are not identical:

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	MgO.	CaO.	K ₂ O.	Na ₂ O.	H ₂ O.
I.	72.9	15.4	2.89	—	0.41	4.40	5.11	0.5 per cent.
II.	70.98	15.50	3.21	traces	0.72	4.70	5.01	2.21 „ „
III.	75.0	18.72	1.2	—	0.2	2.31	2.78	1.03 „ „

On the other hand, the fresh decomposition products of a granite from under humus at Schierke closely resembles crude kaolin. The moors must, therefore, be credited with a kaolinising power. G. Y.

Calcium Sulphide (Oldhamite) in the Allegan Meteorite. WIRT TASSIN (*Proc. U.S. National Museum*, 1908, 34, 433—434).—Certain portions of this meteoric stone when treated with acid were noticed to evolve a considerable amount of hydrogen sulphide, and an analysis of the fine powder, freed from magnetic particles, showed the presence of 16.66% CaS in an olivine-enstatite mixture. This constituent could not be detected on a microscopical examination of the stone, and it appears to be present in a finely-divided state in the ground mass.

L. J. S.

Meteoric Chromites. WIRT TASSIN (*Proc. U.S. National Museum*, 1908, 34, 585—590).—Small quantities of chromite are present in

most meteorites; in stones and stony irons rarely as much as 3%, and usually less than 1%, whilst in irons there is generally less than 0.01%. The following nine analyses were made on material isolated from the meteorites named, and eight earlier analyses of meteoric chromites are quoted.

are quoted.	Cr ₂ O ₃ .	Al ₂ O ₃ .	Fe ₂ O ₃ .	FeO.	MgO.	SiO ₂ .

* Trace of TiO_2 .

From the Admire pallasite, I was of small, non-magnetic, jet-black grains with a brilliant lustre; and VIII, of bluish-brown, magnetic particles with a dull lustre, isolated from the metallic portion of the meteorite. II, from the metallic portion of the Mount Vernon pallasite, had the form of relatively large (1 mm. across) octahedra with black colour and brilliant metallic lustre, D 4.49; whilst III had the form of minute, rounded grains, frequently enclosed in the olivine, and was brownish-black with a resinous lustre. IV, from the Canyon Diablo iron, had the form of small octahedra and rounded grains, was jet-black with brilliant lustre, and non-magnetic; IX, from the same iron, was in rounded grains, with bluish-black colour and dull lustre, and was strongly magnetic, being really a chromiferous magnetite.

Only the first of these analyses approximates to the typical chromite formula, $\text{FeO} \cdot \text{Cr}_2\text{O}_3$; the others contain variable amounts of alumina and magnesia, but are of the type $\text{RO} \cdot \text{R}_2\text{O}_3$. L. J. S.

L. J. S.

Physiological Chemistry.

The Total Sugar of the Blood. RAPHAEL LÉPINE and BOULUD (*Compt. rend.*, 1908, 147, 226—228).—The total amount of the reducing sugar of the blood can be ascertained by hydrolysing the clot with hydrofluoric acid, and adding the amount of reducing substance thus obtained to that in the filtrate from the clot. S. B. S.

S. B. S.

The Occurrence of Proteose in Blood and Urine. L. BORCHARDT (*Zeitsch. physiol. Chem.*, 1908, 57, 305—312).—If elastin is given in the food in fairly large amounts to dogs, a proteose (hemielastin) can be detected in the blood, and this is excreted by the kidneys and found in the urine. W. D. H.

W. D. H.

Fatty Degeneration in the Blood. SAMUEL G. SHATTOCK and LEONARD S. DUDGEON (*Trans. Path. Soc. London*, 1907, 58, 227—255).—In preparations of blood corpuscles hardened in formaldehyde, and stained with Scarlet [?Scarlet R], it is contended that stained particles in the leucocytes in various cases of disease indicate the occurrence of fatty degeneration.

W. D. H.

Estimation of Catalases and Oxydases in Blood. II. WALTHER LÖB and PAUL MULZER (*Biochem. Zeitsch.*, 1908, 13, 475—495).—The rate of oxygen evolution was estimated both by the volume and pressure methods already described (this vol., ii, 999). The rate of reaction depends on the quantity of blood added. The curves representing the rate of gas evolution show with small quantities of blood a gradual rise. In the presence of larger quantities, the gradual rise is preceded by a sharper one. The velocity constant is not the same as that of the hæmase studied by Senter, and, from the complexity of the reaction, it is possible that more than one enzyme takes part in the reaction. The rate of action varies with the blood of different animals (rabbits). The action of various oxygen depolarisers was studied. Benzidine, formaldehyde, and salicylic acid are readily oxidised, but not alcohol.

S. B. S.

The Regulation of the Physico-chemical Properties of the Blood after Injection of Different Solutions. GIUSEPPE BUGLIA (*Biochem. Zeitsch.*, 1908, 13, 400—439).—Hypertonic, isotonic, and hypotonic saline and sucrose solutions were injected into dogs, and certain quantities of blood were withdrawn from the animals both before and at different intervals after the injections. Determinations were made of the conductivity and viscosity of the serum, the molecular concentration of the defibrinated blood (by lowering of freezing-point method), and the volume of the corpuscles (by the hæmatocrite). Injections of hypertonic sodium chloride solutions were found to increase the molecular concentration of the blood and conductivity of the serum over a relatively long period, whereas they caused only a very temporary dilution of the blood volume. The changes produced by hypertonic sucrose solutions were only of temporary character, and disappeared much more quickly than those produced by sodium chloride. Isotonic solutions produced but slight changes, and so also did strongly hypotonic solutions, when the volume of the injected liquid and the rate of injection were not great. If, however, the quantity of the fluid and the rate of injection is sufficiently great to produce marked changes in the blood elements, then the physico-chemical changes are demonstrable.

S. B. S.

The Influence of Alkaline Ferro- and Ferri-cyanides on Blood-coagulation. J. LARGUIER DES BANCLES (*Compt. rend.*, 1908, 147, 266—268).—Both potassium ferro- and ferri-cyanides have a marked inhibitory action on the coagulation of the blood and of fibrinogen solutions, the latter acting more powerfully than the former, although it gives no precipitate with soluble calcium salts, whereas the

former does. It is suggested that multivalent negative ions inhibit the coagulation of negative colloids.

S. B. S.

Hæmolytic Poisons, especially Bile Salts and Soaps.

F. NEUFELD and HÂNDEL (*Chem. Zentr.*, 1908, ii, 891—892; from *Arch. Kais. Gesundh. Amt.*, 1908, 28, 572—584).—This is a study of the corpuscle-dissolving action of sodium taurocholate, soaps, and potassium hydroxide in comparison with other blood poisons, also of the action of hæmolytic agents on lipoids and proteins, so that their action on the cell-membrane and their destructive action on the whole corpuscle may be distinguished. Lecithin is soluble in a 10% solution of sodium taurocholate, but not in normal potassium hydroxide, or in a 1% solution of an oleate. Cholesterol crystals are soluble in none of these solutions, nor in sapotoxin. The taurocholate dissolves protein. In emulsions of olive oil in physiological salt solution, partly with lecithin and partly with egg-white, the addition of sodium taurocholate produces the liberation of fat, and the solution of lecithin and protein; the other materials used do not produce this effect.

In high concentrations, sodium taurocholate produces in the blood of sheep, goat, and ox an inhibition of hæmolysis, which in lower concentration rises as the concentration increases to an optimum. These three sorts of blood are peculiar in that they are refractory to pure cobra venom; the venom acts hæmolytically in the presence of lecithin. Other kinds of blood (guinea-pig, horse, hen) never show any inhibition unless physiological salt solution is replaced by an isotonic solution of sucrose.

Sodium taurocholate and a series of other hæmolytic agents are capable of uniting with complement, but this is not the case with all blood poisons; it depends on what constituent of the stroma or serum the poison is united to. In the case of sapotoxin, there is, for instance, no union with complement. The destruction of pneumococci by bile salts is also described, so also is "phagocytosis by emulsified fat droplets and the influence of specific anti-sera thereon."

W. D. H.

Hæmolysis. LEO VON LIEBERMANN (*Biochem. Zeitsch.*, 1908, 13, 363—364. Compare Abstr., 1907, ii, 973).—In order to produce hæmolysis of the corpuscles of pig's blood, 0.05 c.c. of pure oleic acid, and not oleic acid emulsion, as stated in the previous paper, should be added to 10 c.c. of pig's serum. There is also an error in the same place, as to the order in which different substances should be added to produce hæmolysis.

S. B. S.

Bactericidal Action of Normal Serum. ROBERT MUIR and CARL HAMILTON BROWNING (*J. Pathol. Bacteriol.*, 1908, 13, 76—91).—A distinction is drawn between absorption of complement by bacteria and the bactericidal effect which may follow. Treatment of a normal serum with increasing amounts of a dead emulsion of a bacterium usually produces first a diminution of its bactericidal action on that bacterium, then for that on other bacteria, and finally a diminution of the hæmolytic complement. This shows there is in serum a substance

(bacteriophilic complement) with an affinity for bacteria in general. If the bactericidal action has been reduced as indicated above, it can be more than restored by adding a little of the homologous immune substance.

W. D. H.

Digestion of Fat. III. S. A. LEVITES (*Zeitsch. physiol. Chem.*, 1908, 57, 46—48. Compare Abstr., 1907, ii, 891).—The glycerol constituent of fat is rapidly absorbed. Absorption begins in the duodenum, and is completed in the neighbourhood of the cæcum. In the estimation of glycerol in the intestinal contents, the method of Shukoff and Schestakoff, which depends on the solubility of glycerol in acetone, gives results which are too high. Lewkowitsch's acetin method is better.

W. D. H.

Nutritive Value of Plant Amides. ERNST SCHULZE (*Zeitsch. physiol. Chem.*, 1908, 57, 67—73).—A critical review of the difference of opinion which has arisen between Lehmann, on the one hand, and Morgen and Henriques and Hansen, on the other, with reference to the nutritive value of asparagine and similar amides.

W. D. H.

Ferments of Nuclein Metabolism. ALFRED SCHITTENHELM (*Zeitsch. physiol. Chem.*, 1908, 57, 21—27. Compare Abstr., 1907, ii, 109, 564).—Previous work by the author (and by W. Jones) has shown that the formation of uric acid from nuclein is due to a succession of ferment actions. It is now shown that these ferments can be precipitated from organ-extracts by alcohol or by ammonium sulphate, and these ferments, when acting on pure guanine, resolve it quantitatively into uric acid; under favourable conditions, the time may be as short as one to two hours. Bacterial action, which some authors lay stress on, is not the cause of the change.

W. D. H.

Chemistry of Digestion. XXVI. The Behaviour of Different Proteins in the Stomach and Upper Duodenum of the Dog. E. S. LONDON and W. W. POLOWZOWA (*Zeitsch. physiol. Chem.*, 1908, 57, 113—130. Compare this vol., ii, 870).—Various proteins of animal and vegetable origin are not absorbed in the stomach. Proteins from serum and egg-white are difficult of digestion in the stomach, but most others are rendered soluble to the extent of 78%, the proportion between proteoses, peptones, and residual substances being 59.3, 32.9, 7.8. The juices in the first part of the duodenum act immediately on the soluble products of gastric digestion, resolving them into ultimate cleavage products, whereas the undissolved substances in the chyme are not attacked for some time. The first 6 or 7 centimetres of the duodenum absorb about 6% of the protein.

W. D. H.

Absorption of Protein. KORNÉL VON KÖRÖSY (*Zeitsch. physiol. Chem.*, 1908, 57, 267—287).—The view is advanced that the cleavage products of protein digestion cannot be detected in the circulating blood; the percentage of protein in the blood is, however, increased, although whether protein synthesis occurs in the intestinal wall or in

the blood itself is unsettled. The non-coagulable nitrogen in the blood is not increased, as stated by Cathcart and Leathes. W. D. H.

Muscular Activity and Protein Metabolism. PHILIP A. SHAFFER (*Amer. J. Physiol.*, 1908, 22, 445—455).—The experiments made on two men, and given with full details, showed a rise of total nitrogen excreted in one, and a fall in the other, with muscular work. Work within physiological limits has *per se* no effect on protein metabolism as indicated by the nitrogen and sulphur of the urine. The excretion of uric acid, urea, ammonia, and creatinine is wholly unaffected.

W. D. H.

The Value of Protein Cleavage Products in the Animal Organism. VII. EMIL ABDERHALDEN and JOSEF OLINGER (*Zeitsch. physiol. Chem.*, 1908, 57, 74—79. Compare this vol., ii, 51).—The present experiments on a dog fed with the final cleavage products of casein and meat, confirm results recorded previously that such substances are capable of maintaining weight and nitrogenous equilibrium.

W. D. H.

The Influence of Nitrogen-free Sources of Energy on the Rate of Protein Decomposition by the Organism. W. FALTA and A. GIGON (*Biochem. Zeitsch.*, 1908, 13, 267—273).—Dogs of similar size were fed on a standard diet for a time, and then allowed to fast for various periods. They were then given diets consisting, in one set of experiments, of meat alone; in another, of a mixture of meat and levulose; in another, of meat and inosite, and in a fourth set, of meat and alcohol. It was found that the longer the period of fasting before administration of the meal the more rapid the protein decomposition (as estimated by the nitrogen excreted), and the less the protein-sparing action of the carbohydrate when this formed part of the food. The addition of inosite only slows the rate of protein decomposition during the first twelve hours. The time of the fast before the meal has no influence on the action of inosite. Alcohol accelerates the rate of protein decomposition. There is a tendency in the organism to replenish the glycogen stores which had become depleted by fasting, and this is done by obtaining the carbohydrate entirely from the protein when no other glycogen-former is ingested; hence, after fasting, the rapid degradation of protein. The carbohydrate store in the organism has therefore great influence on the time of decomposition. Experiments were also carried out on the effect of superposing various extra diets on a standard diet. It was found that the composition of the standard diet exerts considerable influence on the time of decomposition of the superposed diets.

S. B. S.

The Influence of Nitrogen-free Sources of Energy on the Rate of Protein Decomposition by the Organism. G. A. PARI (*Biochem. Zeitsch.*, 1908, 13, 274—280).—The experiments were similar in character to those of Faltz and Gigon (see preceding abstract). The effects of the addition of carbohydrates other than

lævulose and of fat, on the rate of protein decomposition after a fast, were investigated. It was found that after a long fast, sucrose no longer has the power of slowing the rate of protein decomposition. Fat and β -hydroxybutyric acid, which are not glycogen formers, do not lose, however, their power to retard the rate of decomposition.

S. B. S.

The Influence of the Thyroid Gland on the Rate of Decomposition. G. A. PARI (*Biochem. Zeitsch.*, 1908, 13, 281—284).—Eppinger, Falta, and Rudinger have shown that in dogs without thyroid glands, the protein metabolised during fasting is less, and can be but little diminished by carbohydrates or fat, in contrast to what happens in the normal starving animal. The latter fact is attributed, from other factors discovered, to the depression of carbohydrate metabolism in animals deprived of the thyroid. To throw further light on this matter, experiments similar to those recorded in the preceding abstracts were carried out with animals deprived of the thyroid, which received meals of meat, with or without addition of other food-stuffs, after a period of fasting, and the rate of protein decomposition was determined by estimating the rate of nitrogen excretion. In the normal animal, the influence of carbohydrates on the retardation of the decomposition of protein is diminished by longer periods of fasting. In thyroidectomised animals, long periods of fasting do not diminish this delaying influence to anything like the same extent.

S. B. S.

Influence of Thyroidectomy and Thyroid Feeding on Intermediary Metabolism. FRANK P. UNDERHILL and TADASU SAIKI (*J. Biol. Chem.*, 1908, 5, 225—242).—After complete thyroidectomy and parathyroidectomy in dogs, the urinary ammonia is increased beyond what is observed in inanition. The nitrogen in the form of creatinine, purine, and allantoin is unaltered, but creatine is found in the urine. These dogs are incapable of utilising dextrose introduced subcutaneously to anything like the same degree as normal dogs can. The loss of the glands may thus cause a change in gaseous metabolism similar to that seen in cretinism. If normal dogs are fed on thyroid, the urinary nitrogen is increased; there is also a larger output of purine-nitrogen, and a low output of phosphorus. There is, however, but little change in the inter-relation of the urinary nitrogenous constituents.

There is no choline in the blood after thyroidectomy. W. D. H.

The Utilisation of the Energy of Provender as Influenced by the Temperature of the Surroundings, and the Nutritional Condition of Rabbits. W. USTJANZEFF and G. BOGAJEWSKY (*Biochem. Zeitsch.*, 1908, 13, 365—399).—Rabbits were fed for a preliminary period on a given diet which was insufficient for the energy needs of the organism. The carbon and nitrogen content, and also the calorific value of this diet and of the excreta, were estimated, and from these data, the loss from the body of fat and protein calculated, and also the calorific value of this loss. The same animal was then given the like diet with the addition of hay, and

the same data obtained as in the preliminary period. From the two sets of data, the physiological food value of the hay was calculated. Experiments were carried out with animals in varying conditions of nutrition, and with the surrounding atmosphere at varying temperatures (0° , 20° , and 30°). It was found that Rübner's law of isodynamic replacement holds good if hay is used as provender, when the physiologically available energy of the latter is only about half of the total energy needs of the animal, and when the animal is kept in an atmosphere of low temperature.

S. B. S.

Secretin. OTTO VON FÜRTH and CARL SCHWARZ (*Pflügers Archiv*, 1908, 124, 427—446).—Extracts of intestinal mucous membrane, prepared according to the method of Bayliss and Starling, contain choline. Choline stimulates pancreatic activity, and this action is antagonised by atropine. The secretin of Bayliss and Starling is a mixture of several substances, among which choline occurs. The effect of secretin is not abolished, but only lessened, by atropine.

W. D. H.

Oxidation Processes in Echinoderm Eggs. OTTO WARBURG (*Zeitsch. physiol. Chem.*, 1908, 57, 1—16).—The research deals with the respiratory process, measured by the amount of oxygen used, in the eggs of *Arbacia pustulosa*. The figures given show (1) that the amount of oxygen used is from six to seven times greater in fertilised than in unfertilised eggs; (2) this is not mainly used in nuclear division, for at the stage when thirty-two cells are present, the use of oxygen is not proportionately increased from the stage when eight cells are present; (3) moreover, if the continuance of cell division is hindered by hypertonic sea-water, the amount of oxygen used is not markedly altered; (4) an egg-cell breathes 500 (± 100) times more vigorously than a sperm cell; (5) hypertonic solutions increase the use of oxygen in unfertilised eggs ten-fold; (6) a transference from hypertonic to normal sea-water also leads to an increase, but not such a marked one; (7) the temperature-coefficient shows the process to be a chemical one.

W. D. H.

A Mono-amino-diphosphatide in Egg-Yolk. HUGH MACLEAN (*Zeitsch. physiol. Chem.*, 1908, 57, 304).—A mono-amino-diphosphatide (P : N = 2 : 1) analogous to Erlandsen's cuorin, which he separated from heart muscle, can be separated from egg-yolk.

W. D. H.

A Globulin from the Egg-Yolk of *Squalus acanthias*. CARL L. ALSEBERG and E. D. CLARK (*J. Biol. Chem.*, 1908, 5, 243—246).—The egg-yolk of the spiny dogfish contains no vitellin, but in its place, a globulin (or a mixture of globulins) which does not contain phosphorus, and, probably, iron is also absent.

W. D. H.

The Assimilation of Phosphorus and Calcium during the Embryonic Life of the Chick. EM. CARPIAUX (*Bull. Acad. roy. Belg.*, 1908, 283—295).—Analyses were made of the inorganic and lecithin-phosphorus and of the calcium in eggs in different stages of develop-

ment. It was found that the chick during embryonic life uses chiefly the phosphorus in the egg itself, and if it utilises that of the shell at all, it does so only to a very limited extent. The shell furnishes four-fifths of the calcium necessary for the formation of the chick, and towards the end of the incubation period considerable use is made of this calcium. At this period, destruction of the lecithin takes place, which proceeds *pari passu* with the utilisation of the lime.

S. B. S.

The Peroxydases of Animal Tissues. FR. BATTELLI and MILZ. L. STERN (*Biochem. Zeitsch.*, 1908, 13, 44—88).—Tissue extracts possess the capacity of increasing the rate of oxidation of hydriodic acid by means of hydrogen peroxide. The reaction is manifested when carried out in the presence of starch. In the cases of most tissues, the reaction is masked by the presence of a catalase, which causes a too rapid destruction of the peroxide. If, however, ethyl hydroperoxide is employed instead of hydrogen peroxide, the reaction can, in most cases, be demonstrated, for the catalase of the tissue does not act on this substance, which possesses a similar peroxydase reaction to hydrogen peroxide. Even when the former peroxide is employed, the results are uncertain, and this fact is probably due to the presence of the substances in the tissues, which react chemically with iodine and thus mask the iodine-starch reaction. A more suitable method of investigating the peroxide reaction of the tissues consists in estimating the amount of carbon dioxide evolved when tissue extracts are treated with ethyl hydroperoxide or hydrogen peroxide and formic acid. The oxidation which then takes place, can occur in acid solutions, under which condition the catalase action on hydrogen peroxide is considerably depressed. The following tissues were investigated, and are enumerated in order of the magnitude of their peroxydase content: liver, kidneys, spleen, lungs, pancreas, lymph glands, ox-muscle, brain, testicles, dog-muscle, thymus, suprarenals, thyroid, rabbits muscle. Blood is also rich in peroxydase. The optimum temperature of reaction in most cases is 38—40°, and the ferment is destroyed at 66° in neutral media and at 55° in acid or alkaline media. In the case of the blood, however, the reaction is much more energetic at 55—60°, and is in other respects anomalous. It is stated to contain a so-called pseudo-peroxydase in the pigment. The formaldehyde is also oxidised under the same conditions as formic acid, but not so energetically. Higher fatty acids, which *in vivo* are readily oxidised, do not cause evolution of carbon dioxide under the same conditions as formic acid does. For this reason, it is not yet possible to determine the exact biological functions of peroxydases.

S. B. S.

Mode of Oxidation of Phenyl Derivatives of Fatty Acids in the Animal Organism. HENRY D. DAKIN (*J. Biol. Chem.*, 1908, 5, 173—186).—The subcutaneous injection of sodium phenylbutyrate results in the excretion of phenaceturic acid and a small quantity of β -hydroxy- γ -phenylbutyric acid. No phenylacetone or phenylacetoacetic acid could be found.

If β -hydroxy- γ -phenylbutyric acid is given in the same way, phenaceturic acid is again excreted, and phenylacetone could not be detected.

Administration of phenylacetone results in the excretion of hippuric acid, phenylacetic acid not being formed. The probable mode of oxidation of phenylbutyric acid in the body is therefore:

Phenylacetic acid is excreted as phenacetic acid. The intermediate formation of ketones is probably confined to phenylbutyric and phenylpropionic acids, and is not a general reaction. In normal metabolism, probably only part of the butyric and phenylpropionic acids passes through the stage of acetone and acetophenone respectively.

Phenylisocrotonic acid is excreted as phenacetic acid.

β -Dihydroxyphenylbutyric acid is excreted as hippuric acid and a little β -hydroxyphenylbutyrolactone. Mandelic acid is not formed. Dihydroxyphenylbutyric acid therefore does not undergo β -oxidation, but oxidation takes place at the γ -carbon atom. Dihydroxyphenylbutyric acid is not a product of the catabolism of phenylbutyric acid.

Phenylacetone is readily identified by conversion into its *p*-nitrophenylhydrazone, which crystallises from alcohol or pyridine in sparingly soluble rosettes of platelets, melting at 145–145.5°.

W. D. H.

Chemistry of the Brains of Birds and Fishes. ALFRED ARGIRIS (*Zeitsch. physiol. Chem.*, 1908, 57, 288–295).—Cerebron from human brain yields 21.83% of galactose; that from birds' brain, 21.75%. A crystalline substance corresponding with Thudichum's sphingosin was also obtained. The birds employed were hens and ducks. Fishes' (cod) brain yielded cholesterol, lecithin, jecorin, and so-called protagon.

W. D. H.

The Chemical Composition of Peripheral Nerves. FRITZ FALE (*Biochem. Zeitsch.*, 1908, 13, 153–172).—Both medullated and non-medullated nerves were investigated (sciatic of man, and splenic nerves of ox). The dried medullated nerves were extracted consecutively with benzene, acetone, and ether; the ether-soluble fraction was treated with alcohol, and to the filtrate from the precipitate thus produced, ammoniacal lead acetate in alcohol was added and, after separation of the precipitate and excess of precipitant, alcoholic cadmium chloride solution. By means of the various solvents and precipitants, a series of fractions was obtained, which were partly identified with known substances. The benzene-soluble fraction consisted chiefly of ordinary fats; the acetone extract contained chiefly cholesterol (m. p. 145°); from the ethereal extract a cerebroside separated, and by the precipitation of this extract with alcohol, the cephalins. Ammoniacal lead acetate precipitated another product belonging to the group of cephalins (m. p. 174°). The cerebroside was identical with the cerebrone of Thierfelder (m. p. 209°). The cephalin (m. p. 174°) had the chemical composition of a mono-amino-monophosphatide; it could not be identified with the cephalins already described and obtained from the brain. Only a

small quantity of cadmium chloride precipitate soluble in cold benzene was obtained, and the amount of lecithin appeared therefore to be small and to be accompanied by other phosphatides, which have not yet been identified. A quantitative separation of the various constituents of medullated and non-medullated nerves showed that the former contained 25% cholesterol, 12.4% cephalins, 18.3% cerebrosides, and 2.9% lecithin, whereas the latter contained 47% cholesterol, 23.7% cephalins, 6% cerebrosides, and 9.8% lecithin.

S. B. S.

Weigert's Method of Staining Medullated Nerve Fibres. J. LORRAIN SMITH, W. MAIR, and JOCELYN F. THORPE (*J. Pathol. Bacteriol.*, 1908, 13, 14—27).—Weigert's method of hæmatoxylin staining, after treatment with potassium dichromate, depends, as osmic acid staining does, on the presence of an unsaturated grouping in the fatty matter present. Cholesterol by itself gives a negative result, although it contains an unsaturated grouping, but it forms myelin figures in contact with soap. These and the crystals described in tissues by C. P. White (composed of cholesterol and fatty acid) stain slowly by the Weigert method. Some results obtained with lecithin are attributed to cholesterol as an impurity in the lecithin used.

W. D. H.

Action of Curare and Physostigmine [Eserine] on Nerve-endings. Action of Barium Chloride on Bird's Muscle. CHARLES WALLIS EDMUND and GEORGE B. ROTH (*Amer. J. Physiol.*, 1908, 23, 28—45, 46—47).—The tonic contraction produced by nicotine in muscles is counteracted by curare; this antagonism is less marked if the nerves are cut, and, as a rule, this lessening of the antagonism coincides in data with the degeneration of the nerve-ending. This may be because denervated muscle has an increased sensitiveness towards nicotine, so that curare is unable to displace it. This view is upheld, and so curare is considered to act, not on the nerve-ending as usually taught, but on the muscle, or on some substance in the muscle of the nature of Langley's receptive substance. As a support to this view, experiments with eserine are recorded. This alkaloid acts in the same way as nicotine, only more slowly. It acts more quickly on denervated muscle, which, therefore, has an increased sensitiveness to it. Curare neutralises the effect whether the muscles are denervated or not. The tonic contraction produced by barium chloride is, however, not antagonised by curare under any circumstances.

W. D. H.

Chemico-physical Investigation of the Crystalline Lens. FILIPPO BOTTAZZI and NOE SCALINCI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 153—159).—The aqueous humour of the eye contains normally a very small proportion of protein, which is coagulable by heat, but has not the characters of the lenticular protein, and probably has its origin in the blood or lymph. The vitreous body resembles a sponge, the net-work of which consists of protein substances coagulable by heat, and contracts during coagulation, expressing the liquid contained

the alveoli. This liquid contains a small quantity of a substance precipitable by acetic acid and insoluble in excess of the acid, and is possibly identical with the coagulable protein found in the aqueous humour. Neglecting these small amounts of proteins, the ocular liquids may be regarded as aqueous solutions of crystalloids, mainly of sodium chloride. With regard to their chemical reaction, the ocular liquids behave like a solution of sodium hydrogen carbonate containing sufficient carbon dioxide to render it neutral to phenolphthalein. Excess of carbon dioxide in the ocular liquids renders them acid to phenolphthalein, and may result in the precipitation of the protein as alkali-protein and in the production of superficial opacity of the crystalline lens.

T. H. P.

Amount of Choline in the Lecithin of Heart Muscle. HUGH MACLEAN (*Zeitsch. physiol. Chem.*, 1908, 57, 296—303).—The lecithin of heart muscle when decomposed in aqueous or alcoholic solution yields, on the average, not more than 52% of its nitrogen in the form of choline. Whether a second nitrogenous product is also present is to be investigated.

W. D. H.

Hydrolysis of Chicken Flesh. THOMAS B. OSBORNE and FREDERICK W. HEYL (*Amer. J. Physiol.*, 1908, 22, 433—439).—The entire muscle was used, the substances soluble in water, alcohol, and ether having been removed. The result of hydrolysis shows that the amino-acids occur in different proportions from those given previously by Abderhalden and Sasaki and by Hart in relation to the syntonin of ox flesh. It is, however, doubtful whether the analyses can be fairly compared, especially as the sum total of the products in one case is 50%, and in the other 47%, of the material employed. The most striking feature in the hydrolysis of chicken muscle is the high yield of lysine.

W. D. H.

The Degradation of Acetoacetic Acid in the Animal Body. II. GUSTAV EMBDEN and LOUIS MICHAUD (*Biochem. Zeitsch.*, 1908, 13, 262—266).—It has been already shown that the liver tissue possesses the property of destroying acetoacetic acid. As the latter is excreted in cases of diabetes, experiments were carried out to determine whether this is due to increased production, or to the loss of capacity of the liver in diabetic individuals to destroy the acid, which is probably a normal intermediary metabolism product. For this purpose, experiments were made with the liver of dogs which had been rendered diabetic by the extirpation of the pancreas. Control experiments were carried out with the liver tissue of similar normal animals. It was found that the capacity for destroying acetoacetic acid was the same in the liver of the diabetic as in that of normal animals. The muscular tissue of diabetic animals also retained its property of destroying the acid.

S. B. S.

The Behaviour of Creatine in Autolysis. A. ROTHMANN (*Zeitsch. physiol. Chem.*, 1908, 57, 131—142. Compare Stangassinger, this vol., ii, 515).—According to Gottlieb and Stangassinger (Abstr.,

1907, ii, 637), creatine and creatinine are destroyed or altered by ferment action during autolysis. Mellanby (this vol., ii, 308) finds, on the other hand, that this is not the case if bacteria are excluded. The present experiments undertaken with aseptic and antiseptic precautions confirm the results of the first-named authors.

W. D. H.

The Action of Arsenic on Autolysis. LEO HESS and PAUL SAXL (*Chem. Zentr.*, 1908, ii, 338; from *Zeitsch. exp. Path. Ther.*, 1908, 5, 89—93).—The action of arsenic, even when highly dilute, is inhibitory towards the autolytic changes in organs (liver). This is designated negative catalysis.

W. D. H.

The Occurrence of Choline in Thymus, Spleen, and Lymph Glands. CARL SCHWARZ and R. LEDERER (*Pflüger's Archiv*, 1908, 124, 353—360).—The occurrence of choline in extracts of thymus spleen, and lymph glands is proved by chemical and physiological tests. The effect that extracts of these organs have in lowering blood pressure is attributed mainly to choline. Other depressor substances present were not chemically identified, but the suggestion is made that they may belong to the group of histones.

W. D. H.

The Depressor Substance in the Thyroid. OTTO VON FÜRST and CARL SCHWARZ (*Pflüger's Archiv*, 1908, 124, 361—368).—The substance present in thyroid extracts which depresses arterial pressure is identified as choline.

W. D. H.

The Chemistry of Amyloid Degeneration. OLAV HANSEN (*Biochem. Zeitsch.*, 1908, 13, 185—197).—The amyloid tissue (the "sago granules" of the spleen) was separated from the surrounding tissue by a mechanical method. The product obtained in this way was, when dried, a yellow or brown powder, which gave the usual blue coloration with iodine after addition of sulphuric acid, and the ordinary protein reactions. The C:N ratio in three different preparations was constant (approximately 4); these contained no oxidised sulphur, and consequently no conjugated sulphuric acid, and the observation of previous observers, who noted the presence of chondroitin sulphuric acid, appears to be incorrect. The amyloid tissue is, in general, very resistant to the action of proteolytic ferments; it is changed, however, by the action of pepsin and hydrochloric acid into a product which is soluble in dilute ammonia, but which no longer gives the iodine reaction. The capacity to give this reaction is also lost on treatment of the tissue with alkalis.

Although the mechanically separated amyloid tissue itself contained no oxidised sulphur, the organs from which it had been obtained did. It seems probable that the chondroitin sulphuric acid or a similar substance is formed at the same time as the amyloid tissue. No other marked differences between amyloid and normal tissue were ascertained.

S. B. S.

So-called Fatty Degeneration of the Suprarenal. CHARLES POWELL WHITE (*J. Pathol. Bacteriol.*, 1908, 13, 11—13).—The

presence of fats and lipoids in the suprarenal cortex is a physiological condition. The cortex is believed to be engaged in the secretion of cholesterol, lecithin, and fats, and this has some connexion with the regulation of growth and development. W. D. H.

Silicic Acid in Whartonian Jelly. FRANZ FRAUENBERGER (*Zeitsch. physiol. Chem.*, 1908, 57, 17—20).—The amount of silicic acid in the Whartonian jelly of the human umbilical cord is less than Schulz stated it to be. According to Schulz, the ash contains 0.6% of the acid; the figure should be 0.028. W. D. H.

The Action of Electrolytes on the Rhythmic Movements of Medusæ. I. Action of the Salts of Sea-water. ALBRECHT BETHE (*Pflüger's Archiv.*, 1908, 124, 541—578).—An investigation of the various salts, alone and in combination, on the movements of jelly fish was carried out on the lines of the well-known work of Loeb and others. The relative importance of the various ions is discussed. Thus sodium chloride by itself first stimulates and then paralyses the movements; this action is reversible; potassium stimulates the rhythm; magnesium paralyses it; the paralysing action of calcium only occurs when it is highly concentrated. W. D. H.

The Circulation of the Bile. GUSTAV BAYER (*Biochem. Zeitsch.*, 1908, 13, 215—233).—Although the bile salts are strongly toxic to individual organs, they are being continually resorbed from the intestine and entering the circulation. They then exert no toxic effect, even in cases of jaundice. This is due to the fact that the salts are changed in some manner by the serum proteins, and are thereby deprived of their toxic character. This was confirmed by investigating the toxic action of bile salts, when alone and when mixed with serum, on muscular tissue, the central nervous system, the circulation, and also the hæmolytic action. The change effected by serum on the bile salts which deprives them of their toxic character is probably of a physical nature ("colloidal envelopment"). Serum which has been previously warmed acts more efficiently in this respect than unwarmed serum. This action between serum proteins and bile salts produces a disappearance of the complement, a fact which was ascertained by allowing red blood corpuscles to act on amboceptor and complement containing sera in the presence of bile salts which had themselves been deprived of their hæmolytic action by means of an inactive serum. The change in the bile salt molecule wrought by the serum renders excretion difficult, and a bile salt thus changed will not readily dialyse. The liver cells exert a great affinity for the bile salts, and the fixation of cholates by these cells can be demonstrated *in vitro*. S. B. S.

Bile Hæmolysis. III. The Reasons of the Increased Rate of Bile Hæmolysis in Concentrated Salt Solutions. GUSTAV BAYER (*Biochem. Zeitsch.*, 1908, 13, 234—242).—It was shown that bile salts diminish the surface tension of salt solutions to a greater extent than they do that of pure water. Substances which lower the surface

tension of a solution tend to concentrate on the surface. The bile salts tend in emulsions of blood corpuscles to collect round the erythrocytes, and the more rapidly the more concentrated the salt solution used as their solvent. In concentrated salt solutions, there is a more rapid entry therefore of the bile salts (which bring about hæmolysis by their action on the lipoids) than in water. S. B. S.

The Influence of Tolyene-2:4-diamine on the Secretion of Cholesterol in the Bile. CHASOBURŌ KUSUMOTO (*Biochem. Zeitsch.*, 1908, 13, 354—362).—The polycholia, following administration of tolylene-2:4-diamine, is stated to be due to the destruction of blood corpuscles; thus supplying material for bile pigment which is derived from hæmoglobin. As the corpuscles also contain cholesterol, it might be expected, therefore, that administration of tolylene-2:4-diamine would also lead to an increased elimination of this substance in the bile. This the author has experimentally shown to be the case. The experiments were carried out on dogs with biliary fistula. S. B. S.

Hæmolytic Factors in Milk. JANET E. LANE-CLAYTON (*J. Pathol. Bacteriol.*, 1908, 13, 34—37).—Milk, when fresh, contains both complement and amoceptor in about 1/10 the strength of that in serum. In order to obtain hæmolysis, "ox-colloid" must be added; this confirms Bordet's views: "Ox-colloid" is prepared by heating ox-serum to 56° for thirty minutes, and then removing the amoceptor by adding about twice the amount of corpuscles which it can sensitize. The mixture is incubated for one hour, and centrifuged; the supernatant fluid is "ox-colloid."

On adding blood-corpuscles to milk, the cream picks them up and carries them to the top. This red plug does not occur if the milk has been previously heated for a few minutes to 70°, and this circumstance may be used to detect heated or pasteurised milk. W. D. H.

The Degree of Acidity of Urine. ADOLF JOLLES (*Biochem. Zeitsch.*, 1908, 13, 177—184).—The concentration of the hydrogen ions was estimated by determining the rate of hydrolysis of sucrose caused by it at various temperatures. At higher temperatures, for example, at 90°, the results were complicated by the decomposition of the urea and the formation of ammonium carbonate. For this reason, the urea was estimated in the urine both before and after the process of inversion, as also the acidity (by titration) and the mono- and di-phosphates. The results indicated that the concentration of hydrogen ions is very small, and corresponds very closely with that due to monosodium phosphate present in the urine. Owing to the decomposition of urea, trustworthy results by sugar catalysis are only obtainable when the temperature of the experiment does not exceed 37°. S. B. S.

The Rate of Elimination of Chloroform. D. NOËL PATON (*Proc. Roy. Soc. Edinburgh*, 1908, 28, 472—496); D. NOËL PATON and DOROTHY E. LINDSAY (*ibid.*, 497—502).—The experiments were performed on dogs and rabbits; the blood and tissues, as well as the excreta,

were examined, and the analytical results given in detail. It was found that when chloroform is given by the respiratory passages, it is first dissolved in the blood, and thus acts on the nerve-centres, excess being rapidly eliminated. If it is subcutaneously administered, and still more if given by the stomach, the assumption is slow, more stable compounds are formed, and elimination is consequently delayed. The drug has thus more time to produce a slow toxic effect upon the protoplasm of the tissues. The onset of late chloroform poisoning after anaesthesia is due to delayed elimination brought about by unusually firm fixation or by respiratory deficiency. W. D. H.

Excretion of Creatinine in Man. C. J. C. VAN HOOGENHUYZE and H. VERPLOEGH (*Zeitsch. physiol. Chem.*, 1908, 57, 161—266. Compare Abstr., 1906, ii, 186).—An extensive series of estimations of creatinine are recorded in health and disease, which confirm, in the main, the conclusions drawn by Folin and other workers. Mellanby's view, that creatinine is converted into creatine in the liver, is confirmed, as is also the statement of Gottlieb and Stangassinger that substances (probably ferments) occur in the liver and other organs which transform creatine into creatinine. If the liver is largely destroyed (for instance, by cancer), large amounts of creatine instead of creatinine pass into the urine. The lowering of hepatic activity will explain the presence of creatine in the urine in fever and hunger. In the healthy tissues and blood, creatinine is never found, as it is removed so quickly by the kidneys. W. D. H.

Excretion of Creatine and Creatinine in Health and Disease. PHILIP SHAFFER (*Amer. J. Physiol.*, 1908, 23, 1—23).—Normally, from 7 to 11 mg. of creatinine nitrogen are excreted per kilo of body-weight. This is constant from day to day and from hour to hour; it is not influenced by the volume of the urine, or by the total nitrogen excreted. This creatinine coefficient is parallel to the muscular efficiency of the individual, and in many diseases it is lowered. Creatinine is not an index of total endogenous protein catabolism, but of some special process of normal muscular metabolism. Mellanby's view that the liver is the seat of its formation, whence it reaches the muscle, is dissented from. The creatinine excretion is slightly increased in acute fevers; here it is not parallel to muscular efficiency. Unless creatine occurs in the food, it is absent from normal urine; it may be excreted in acute fevers, in the acute stages of exophthalmic goitre, by women during involution of the uterus, and in other conditions in which there is a rapid loss of muscle protein. W. D. H.

Cystinuria with Diamines. FRANCIS H. THIELE (*Trans. Path. Soc.*, 1907, 58, 255—263).—A case of cystinuria is recorded; tyrosine and other mono-amino-acids were absent from the urine. The urine contained cystine, and, in addition, excess of neutral sulphur, and also cadaverine; putrescine was present in the faeces. All the cystine was apparently derived from tissue catabolism, since starvation, changes of diet, and administration of cystine made no difference in the amount

excreted. The conclusion is drawn that the tissues were deficient in a ferment which normally removes sulphur from thio-amino-compounds.

W. D. H.

Diuresis. XV. Excretion of Sodium Chloride in Phloridzin Diabetes. JOH. BIBERFELD (*Pflüger's Archiv*, 1908, 124, 532—540. Compare Abstr., 1906, ii, 564).—Polemical. A reply to Loewy and Neubauer on their criticisms of the author's previous work.

W. D. H.

Morphine Diabetes. W. SPITTA (*Chem. Zentr.*, 1908, ii, 343, from *Zeitsch. exp. Path. Ther.*, 1908, 5, 94—104).—The reducing substance often found in the urine of those dosed with morphine is probably lævulose, although it is stated to be optically inactive. Dextrose, glycuronic acid, and pentose are absent.

W. D. H.

Gout. HEINRICH KIONKA (*Chem. Zentr.*, 1908, ii, 342; from *Zeitsch. exp. Path. Ther.*, 1908, 5, 131—141, 142—146).—After the administration of uric urid, glycine can be detected in the blood. A crystalline derivative of it, naphthalenesulphonylglycine, was prepared, which showed all the crystallographic constants of the same substance prepared synthetically. A crystallographic description is also given of the corresponding derivatives of other amino-acids (leucine, alanine, &c.).

Feebly alkaline solutions of glycine, alanine, leucine, and allantoin catalytically accelerate the precipitation of acid urates from solutions of uric acid. The presence of such substances in gout is therefore harmful.

W. D. H.

High Temperatures and Heat Stroke. HARVEY SUTTON (*J. Pathol. Bacteriol.*, 1908, 13, 62—73).—In the human subject, the rise of internal temperature, due to exposure to high external temperature, is accompanied by a marked rise in total respiratory exchange and a rise in the respiratory quotient; this probably points to a greatly increased combustion of carbohydrates.

W. D. H.

Crystals in Tumours. CHARLES POWELL WHITE (*J. Pathol. Bacteriol.*, 1908, 13, 3—11).—Crystals consisting of a loose combination of cholesterol with fatty acids, lecithin, or other substances occur in or among the cells of malignant tumours and in some other conditions. These crystals appear to be associated with cell proliferation rather than with degeneration. In degenerated areas, the crystals formed are mostly either cholesterol, fatty acids, or fats. It is suggested that cholesterol is associated with the regulations of cell proliferation.

W. D. H.

Peptonisation in Raw and Pasteurised Milk. RACHEL H. COLWELL and HENRY C. SHERMAN (*J. Biol. Chem.*, 1908, 5, 247—252).—The conclusion is drawn that pasteurisation is not an ideal process as a safeguard against infectious disease. Heating may destroy acid-producing organisms, but leaves intact putrefactive, ammonia-forming, and peptonising organisms. Pasteurisation at high temperatures (75—90°)

has less restraining effect on peptonisation and development of offensive odours than heating to 60°. The amount of ammonia does not always run parallel with intensity of the putrid odour. The determinations of intensity of odour, and also of peptone by the biuret reaction are admittedly rough, and, although conclusions are drawn in reference to infectious disease, no experiments or observations on pathogenic organisms appear to have been made.

W. H. D.

Action of Wines and of Alcohols on the Frog. VITTORIO NAZARI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 166—172).—In small doses, alcohols have no apparent physiological action on frogs, but in larger doses they produce narcosis or complete muscular relaxation, which lasts a longer or shorter time according to the concentration of the alcohol employed and to the size of the frog. Complete recovery takes place from this narcosis, but larger doses of the alcohols cause death. In the following list, the alcohols examined are arranged in the order of increasing narcotic power: ethyl, methyl, propyl, isobutyl, isoamyl, amyl. The alcoholic content of a wine can be determined roughly by ascertaining at what dilution it just causes or fails to cause narcosis, 1 c.c. of 4% ethyl alcohol having no narcotic influence even on small frogs; in this connexion, the presence in the wines of small proportions of highly narcotic higher alcohols must be borne in mind.

T. H. P.

The Mechanism of the Action of Arsenic Preparations on Trypanosomes in the Animal Organism. II. MARTIN JACOBY and ALBERT SCHÜTZE (*Biochem. Zeitsch.*, 1908, 13, 285—298).—Mice received injections of atoxyl, or of arsenious acid, and were then inoculated with *Nagana* trypanosomes. The trypanosomes from these animals were then inoculated into other animals similarly treated. This process of transference from animal to animal which had been injected with atoxyl or arsenious acid was repeated several times, and the sensitiveness of the trypanosomes obtained after many animals had been thus inoculated towards both arsenious acid and atoxyl was investigated, the experiments being carried out *in vitro*. No marked difference in this respect between these and normal trypanosomes could be ascertained.

S. B. S.

The Behaviour of Iron Arseno-paranuclate and of Arsenious Acid in the Organism. ERNST SALKOWSKI (*Biochem. Zeitsch.*, 1908, 13, 321—338).—The arseno-paranuclate was obtained by precipitating an arsenical peptic digestion product of caseinogen by ferric ammonium sulphate. There is evidence that the product obtained in this way is a definite compound, and not a mixture of ferric arsenate and paranuclate. Its behaviour in the organism was investigated by examining the urine after its administration, and determining the rate and the form of the arsenic excretion. It was found that if alcohol is added to alkaline urine, the arsenic in inorganic form is precipitated, whereas that in organic combination dissolves in alcohol. Iron arseno-paranuclate is readily resorbed from the digestive tract, a fact which confirms the assumption that the arseno-paranuclate is a definite

compound, for arsenate of iron is not readily resorbed. The arsenic excreted is chiefly in the form of an organic compound, although small quantities of inorganic arsenic can be detected in the urine in the first days after the administration. The arseno-paranucleate is also resorbed after subcutaneous injection. After administration of arsenious acid, both organic and inorganic arsenic is excreted, the former being in excess of the latter. Of ingested arsenious acid, at least 62% is excreted in the urine after six days. In some experiments, arsenic was detected in the urine of animals to which no arsenic compound had been directly administered; this is due to the small arsenic content of certain vegetables which served as food.

S. B. S.

Physiological Action of Choline. GEORG MODRAKOWSKI (*Pflüger's Archiv*, 1908, 124, 601—632).—This alkaloid appears to be less toxic than is usually considered to be the case. Many of the physiological effects, including the lowering of blood-pressure, usually attributed to it occur only in commercial specimens, but not in the pure substance. The action of the impurity is antagonised by atropine; hence it is that commercial choline produces, after atropinisation, a rise of blood-pressure, which is always the result if the pure alkaloid is employed. Pure specimens rapidly develop the impurity. The experiments were made with choline synthetically prepared.

W. D. H.

The Behaviour of the Brain towards Strychnine. TORATA SANO (*Pflüger's Archiv*, 1908, 124, 369—380).—The grey cortex of the human brain neutralises the toxic action of strychnine; this is especially marked in the motor areas, and the action is attributed in the main to the giant pyramid cells.

W. D. H.

Action of Strychnine and Caffeine. TORATA SANO (*Pflüger's Archiv*, 1908, 124, 381—391).—From experiments on frogs, the conclusion is drawn that strychnine has an anæsthetic as well as a stimulating action; the former manifests itself mainly on the pain receptive elements of the central nervous system, and the latter on the tactile elements; the stimulating action outlasts the anæsthetic, and is slower of development. Similar conclusions are drawn regarding action of caffeine.

W. D. H.

The Liver in Chloroform Necrosis (Delayed Chloroform Poisoning). GIDEON WELLS (*J. Biol. Chem.*, 1908, 5, 129—146).—Rapid autolysis of the liver cells, sometimes follows chloroform anæsthesia in man. A third or more of the solids may disappear in a few days, and the liver contains proteoses, purine bases, polypeptides, and amino-acids. The sulphur in insoluble form is unaltered, but, in spite of loss of nuclear structure, the insoluble phosphorus is increased. The distribution of nitrogen in mono- and di-amino-acids in the coagulated liver proteins does not differ from the normal. Fatty metamorphosis is present in moderate degree; the increase in ether extractives is due to infiltration with simple fats; the lecithin is

lightly decreased, and the amount of cholesterol unaltered. There is replacement of proteins by water, and more fatty infiltration than in acute yellow atrophy. W. D. H.

Chemistry of Vegetable Physiology and Agriculture.

The Chemical Changes Involved in the Assimilation of Free Nitrogen by *Azotobacter* and *Radiobacter*. JULIUS TOKLASA [with ADOLF ERNEST, FRANZ STRAÑAK and EUGEN VÍTEK] *Centr. Bakt. Par.*, 1908, 21, ii, 620. Compare this vol., ii, 880).—The activity of the culture decreases as it ages, doubtless because of the accumulation of acid. Quantitative experiments made to trace the fate of the dextrose were only partly successful; starting with 5.9 grams of dextrose, 7.9 were converted into carbon dioxide, 0.3 into ethyl alcohol, 0.2 into formic acid, 0.7 into acetic acid, 0.2 into lactic acid, leaving a balance of 6.5 unaccounted for, part of which, however, is assimilated into the cell wall of the organisms.

Contrary to the statements of Severin and Krzemieniewski, hydrogen is invariably liberated, and, if sodium nitrate has been added, a certain amount of nitrite and of ammonia is produced.

The author has made an analysis of the bacterial mass and found 11.3% and ash 8.6%; the latter contained P_2O_5 4.9, and K_2O 2.4, these two substances forming practically the whole of the ash.

E. J. R.

Fixation of Atmospheric Nitrogen by Pure Cultures of *Azotobacter*. Distribution of the Organism. MARTINUS J. BEYERINCK (*Proc. K. Akad. Wetensch. Amsterdam*, 1908, 11, 67—74. Compare Toklasa, this vol., ii, 880).—The author supposed previously that the active agent in nitrogen fixation is not *Azotobacter*, but *acillus radiobacter*, almost invariably found with it. His subsequent experiments have demonstrated the incorrectness of this view, and it is now clear that *Azotobacter* fixes nitrogen. The present paper deals with an improvement in technique, whereby it is possible to obtain a better idea than formerly of the distribution of the organism.

It is customary to use a sugar as the source of carbon in culture solutions, but the author finds that calcium malate is better; his solution was 100 tap water, 2 calcium malate, 0.05 K_2HPO_4 . Plates can be made if 1 to 2 parts of agar agar are also added; on these, a larger number of organisms develop into colonies than on any other plates, so that a more exact estimate of the number of *Azotobacter* present in a sample of soil can now be made. Instead of calcium malate, the lactate, acetate, or propionate can also be used, but in these media the organisms soon lose their power of growth, and inoculation to obtain pure cultures cannot be continued for long. Growth is also slow when calcium citrate, tartrate, or succinate is used, and there is no growth when calcium glycollate is supplied.

The amount of nitrogen fixed per gram of calcium salt oxidised was 4.9 mg. with the propionate, 2.8 mg. with the acetate, 2.6 mg. with the malate, and 1.8 mg. with the lactate. About 7 mg. are fixed for each gram of sugar oxidised when sugar is used as the source of carbon.

When calcium malate plate cultures are made of soil extracts, it is not usual to find colonies of *Azotobacter*, because only a small proportion survive and develop on plates, but when soil adhering to the roots of leguminous plants is examined, a number of colonies are produced, showing that a distinct relationship exists between the distribution of *Azotobacter* and the *Leguminosae*.

E. J. R.

Variation of the Rate of Disinfection with Change in the Concentration of the Disinfectant. HERBERT EDMESTON WATSON (*J. Hygiene*, 1908, 8, 536—542).—Miss Chick's results on the laws of disinfection, in which she showed that the disinfection is strictly analogous to a chemical reaction in which individual bacteria play the part of molecules, can be expressed by a mathematical formula, the use of which is illustrated by one of the problems worked out as follows: A solution of phenol containing 10 parts per 1000 disinfects a culture of *Bacillus paratyphosus* in twenty-five minutes; another solution takes thirty-five minutes. What is the strength of the second solution? Let the strength of the second solution be x ; for phenol, $n = 5.5$. Therefore $5.5 \log 10 + \log 25 = \text{constant} = 5.5 \log x + \log 35$. From this $x = 9.4$.

W. D. H.

Protein Formation in Ripening Seeds. N. WASSILIEF (*Ber. deut. bot. Ges.*, 1908, 26a, 454—467. Compare Abstr., 1901, ii, 185, and Nedokutschaeff, Abstr., 1902, ii, 281; 1903, ii, 508; Zaleski, 1905, ii, 549).—A continuation of work on the source and method of formation of protein in ripening seeds. As the result of a series of determinations, the amounts of nitrogen present in various forms, for example, as protein, asparagine, amino-acids, substances precipitated by phosphotungstic acid, &c., in (1) seeds at various stages of ripeness, (2) whole fruits, (3) husks of fruits, (4) whole leaves, (5) laminae, and (6) petioles, of *Lupinus albus*, the following principal conclusions are drawn.

After the removal of fruits from the plants, protein formation takes place in the former whether they are kept in the dark or in the light, and at the expense of asparagine, present in the fruit as plucked. The amino-acids at first increase slightly in amount, especially if the fruits are kept in the dark, doubtless as the result of protein decomposition, but eventually they are also used up, being probably transformed into asparagine, and then into protein. Organic bases play much the same rôle as amino-acids.

In the foregoing changes, the seeds become gradually richer in nitrogenous material, due to movement of nitrogenous substances from the husks of the fruits to the seeds. At the same time, the seeds become enriched with protein at the expense of the husks, so that the protein of the ripe seeds is, in part, derived from amino-compounds initially present in them when the fruits are plucked, and

in part, from amino-compounds subsequently formed in the husks. Seeds separated from the husks, and kept either dry or damp, form some protein from asparagine and other amino-compounds originally present in them.

T. A. H.

The Rapid Change in Composition of Certain Tropical Fruits during Ripening. H. C. PRINSEN GEERLIGS (*Proc. K. Akad. Wetensch. Amsterdam*, 1908, 11, 74—84).—The fruits investigated are commonly gathered in an immature state; within a few days they become tender and palatable; a few days later, however, they become over-ripe, and change to a soft, unpalatable mass. Experiments with bananas (*Musa*) showed that during the ripening process there is an evolution of carbon dioxide and water, and a considerable conversion of starch into sugar. The composition at the various stages is as follows:

	April 17, unripe.	April 19.	April 20.	April 22.	April 23, ripe.	April 24, over-ripe.
Dry matter, per cent...	41.76	40.79	40.52	40.14	39.02	38.88
Starch.....	30.98	24.98	20.52	13.80	9.59	7.68
Sucrose	0.86	4.43	6.53	10.50	13.68	10.36
Dextrose.....	0.25	0.96	1.80	3.18	4.72	6.1
Lævulose		0.90	1.53	2.70	3.61	4.8

Quite similar results were obtained with the mango (*Mangifera*) and the tamarind (*Tamarindus*).

Oxygen is necessary for the ripening process; bananas will keep their starch intact if surrounded with an atmosphere of nitrogen. The author, therefore, considers sugar production to be a vital process, although he succeeded in demonstrating the presence of an enzyme capable of decomposing starch.

Sapodilla (*Achras sapota*) does not fall into line with the above-mentioned fruits; the amount of sugar before and after ripening remains unaltered, and the change appears to be mainly a softening of the hard pectin, and a deposition of tannin and gutta-percha from the juice as insoluble substances.

E. J. R.

Vegetable Phosphatides. ERNST SCHULZE (*Chem. Zeit.*, 1908, 32, 981—983. Compare this vol., i, 385).—Phosphatides were determined in a number of seeds (without husks), and the following results obtained (percentages in dry matter):

	Phosphorus.		Phosphatides as lecithin.
	Total per cent.	Per cent. in ether-alcohol.	
Yellow lupins	—	0.082	2.14
Blue „	1.53	0.084	2.19
Garden beans	1.32	0.049	1.27
<i>Phaseolus multiflora</i>	—	0.035	0.90
Sunflower	—	0.017	0.44
<i>Pepo cucurbita</i>	2.10	0.021	0.55
<i>Ricinus</i>	1.14	0.011	0.29
Beech	—	0.011	0.30
Chestnut	—	0.026	0.67
Horse chestnut	—	0.026	0.67
<i>Pinus cembra</i>	1.16	0.038	0.99
<i>Pinus maritima</i>	2.60	0.033	0.86

The phosphatide represents only a small percentage of the total phosphorus (in the case of *Ricinus*, only 1%), and, since the seeds contain very little inorganic phosphorus, it is evident that some other organic phosphorus compounds must be present in much larger quantity than the phosphatides. The substance known as phytin, which yields inositol as a cleavage product, is one of these substances, and is presumably of greater importance to plants than the phosphatides.

N. H. J. M.

Water-soluble Polysaccharides of Barley and Malt. HORACE T. BROWN (*Bied. Zentr.*, 1908, 37, 675—676; from *Zeitsch. ges. Brauwesen*, 1907, 30, 286).—Finely-crushed barley (1 kilo.) was stirred with boiling water (7 litres), cooled to 70°, and, after adding 15 c.c. of malt extract, boiled for a long time. A further amount (250 c.c.) of malt extract was then added, and the whole digested for one hour at 50—55° and again boiled. It was then filtered, the residue well washed with hot water, and the filtrate evaporated to 4 litres under reduced pressure. The resulting liquid, D. 1.060, containing 15% of dry matter, was treated with 80% alcohol; on cooling, white flakes of crude amylan separated. The latter, after being thoroughly washed with 60—70% alcohol, was treated with 500 c.c. of water, and again precipitated with alcohol.

The soluble constituents of barley are as follows: ash, 0.75; proteins, 0.75; sugar, 4.10; starch, 56.20, and amylan, 9.65%. The amylan yields, when hydrolysed with 2.5% oxalic acid, chiefly dextrose along with galactose, mannose, arabinose, and xylose.

Crude amylan from malt dissolves readily in cold water, is strongly dextrorotatory, and has slightly reducing properties. When hydrolysed, it yields dextrose and arabinose.

N. H. J. M.

Fruits of *Caulophyllum thalictroides* and *Cornus sericea*. EDITH STOCKTON and C. G. ELDREDGE (*Chem. News*, 1908, 98, 190—191).—The pulp of the fruit of *Caulophyllum thalictroides* contains levulose and small quantities of citric, tartaric, and tannic acids. The crushed nuts yield to ether about 3% of oil, calculated on the whole fruits, of which a portion is volatile and the remainder belongs either to the laurin or olein group.

The pulp of the fruit of *Cornus sericea* contains potassium hydrogen tartrate, potassium hydrogen oxalate, calcium oxalate, gum, tannic, gallic, and malic acids, and a sugar, possibly levulose. The nuts yield to ether a pale amber-coloured oil, which deposits some solid matter, perhaps palmitin, on standing.

T. A. H.

Constituents of the Rhizome of *Imperatoria ostruthium*. JOHANNES HERZOG (*Arch. Pharm.*, 1908, 246, 414—417).—The author has applied the method devised for the preparation of pimpinellin (this vol., i, 905), namely, extraction with benzene and treatment of the concentrated extract with light petroleum, to this rhizome, and has isolated thereby oxypeucedanin, identical with that prepared by Erdmann and by Bothe from the root of *Peucedanum*

officinale. Gorup-Besanez (Abstr., 1874, 907; 1877, 717) obtained ostruthin as the principal constituent of the young rhizome of *Imperatoria ostruthium*, although Heut subsequently (this Journ., 1875, 772) detected oxypeucedanin in the rhizome. It remains to be seen whether ostruthin and oxypeucedanin both occur always in the rhizome, or whether the former is replaced by the latter as the rhizome ages or is collected and stored.

T. A. H.

Constituents of Saffron. BALTHASAR PFYL and W. SCHEITZ (*Zeitsch. Nahr. Genussm.*, 1908, 16, 337—346. Compare Hilger, Abstr., 1900, i, 682).—With the object of devising a process for the detection of inferior saffron (this vol., ii, 997), attempts were made, following lines suggested by the results of previous investigators, to obtain data regarding the properties of the chief constituents of the drug.

The methods suggested by Quadrat (*J. pr. Chem.*, 1852, 56, 68) and Weiss (*ibid.*, 1867, 101, 65), involving the extraction of the saffron, previously freed from fat, &c., by means of ether or light petroleum, with water, and precipitation of the colouring matter (polychroit or crocin) from the aqueous extract by lead acetate or alcohol, do not yield a pure preparation, and the same is true of Kayser's process, depending on the use of animal charcoal for the extraction of the colouring matter (Abstr., 1885, 59). Only amorphous, impure preparations of crocin could be obtained, and these, on hydrolysis with acids, furnished dextrose (compare Kayser, *loc. cit.*; Schunck and Marchlewski, Abstr., 1894, i, 340).

Similarly, Kayser's crocetin (*loc. cit.*) could only be obtained as an amorphous, red mass, which, however, yielded crystalline salts with metals and certain organic bases (compare Decker, Abstr., 1906, i, 686).

Kayser's picrocrocin (*loc. cit.*) could not be prepared, although by using his process for its isolation a small amount of a white, crystalline substance, m. p. 67°, which did not reduce Fehling's solution, was obtained.

From a chloroformic extract of saffron, three substances were isolated: (1) a colourless, crystalline product, m. p. 280°, which did not reduce Fehling's solution; (2) a yellow, crystalline substance, m. p. 164°, readily soluble in water or alcohol, which when boiled with acid developed the odour of saffron oil and yielded a reducing sugar, probably lævulose, and (3) a crystalline hydrocarbon, m. p. 118° (compare Schüler, *Inaug. Diss. Munich*, 1899, and Hilger, *loc. cit.*), apparently similar to the hydrocarbons found in marigold petals, amica flowers, &c. The second of these products somewhat resembles the picrocrocin described by Kayser.

An alcoholic extract of saffron contains, in addition to colouring matter, a sugar (? lævulose) and a glucoside, which, on hydrolysis yields saffron oil and lævulose (?). The sugar provisionally regarded as lævulose is levorotatory, reduces Fehling's solution, yields phenylglucosazone, and gives the Seliwanoff reaction (Abstr., 1903, ii, 616).

T. A. H.

Have Manganese Salts, Employed as Stimulants, a Favourable Influence on Vegetation? SIGURD RHODIN (*Bied. Zentr.*, 1908, 37, 667—668; from *K. Landtbr. Akad. Handl. Tidskr. Stockholm*, 1908, 30—33).—Field experiments with oats grown on peaty soil and with potatoes on rich garden soil. Manganese peroxide (1 kilo. per are), manganese acetate, and benzoate (30 grams per 100 square metres) reduced the yield of oats. In the potato experiment, manganese sulphate (6 kilos. per hectare) was employed. One variety of potatoes showed an increase of 1% of starch on the manganese plot; the total starch was, however, considerably less than without manganese, owing to the smaller yield of tubers. N. H. J. M.

Manurial Experiments with Nitrogen in 1907. HENRIK G. SÖDERBAUM (*Bied. Zentr.*, 1908, 37, 657—659; from *K. Landtbr. Akad. Handl. Tidskr. Stockholm*, 1908, 104—110).—Oats were grown in sandy soil (25 kilos. per pot), and manured with 0.25, 0.5, and 0.75 gram of nitrogen in different forms, in addition to minerals. The relative manurial effects of the nitrogen compounds varied according to the amounts employed. With the smallest amounts, sodium nitrate gave the highest yields. When 0.5 gram of nitrogen was applied, ammonium sulphate gave the best results; then Polzeniusz's, Carlson's, and Frank's calcium cyanamide preparations; the next best were sodium nitrate and albumin (about equal), and last, calcium nitrate. With the largest amounts of nitrogen, ammonium sulphate was again the best; then Carlson's and Polzeniusz's calcium cyanamide; Frank's cyanamide gave considerably less produce, whilst calcium nitrate was again the least satisfactory.

The total divergence of the results from those of the previous year is attributed to the unusually low temperature in 1907, and the consequent more prolonged vegetative period. N. H. J. M.

Field Experiments with Ammonium Sulphate. HERMANN BACHMANN (*Bied. Zentr.*, 1908, 37, 664—665; from *Fühling's Landw. Zeit.*, 1907, 530).—Experiments with rye, oats, barley, and mangolds grown on sandy soil and on loam showed that ammonium sulphate produced considerably greater yields than sodium nitrate. N. H. J. M.

Utilisation of Nitrogen in the Form of Ammonium Nitrate. THEODOR PREIFFER, A. HEPNER, and L. FRANK (*Bied. Zentr.*, 1908, 37, 663—664; from *Mitt. Landw. Inst. K. Univ. Breslau*, 1908, 5, 341).—The plants were grown in sand, and manured with ammonium nitrate and sulphate and sodium nitrate respectively. The position of ammonium nitrate as a manure is between sodium nitrate and ammonium sulphate; it may, however, under certain conditions, equal sodium nitrate. Addition of sodium chloride had no appreciable effect. The favourable results obtained by Wagner with sodium chloride in conjunction with ammonium sulphate may have been due to the presence of zeolites in the soil.

Addition of phosphorite along with ammonium nitrate increased the yield and also the amount of nitrogen taken up. N. H. J. M.

Manurial Trials with Sodium Nitrate and Ammonium Sulphate. H. CLAUSEN (*Bied. Zentr.*, 1908, 37, 585; from *Illustr. landw. Zeit.*, 1907, 27, 842).—Ammonium sulphate proved more effective than sodium nitrate on potatoes, rye, and oats growing on sandy soils. The superiority may be accounted for in several ways; there are indications that the potato plant can directly assimilate ammonia, so that nitrification becomes unnecessary; it is also known that sodium nitrate washes into the sub-soil, and is therefore lost more readily than ammonium sulphate. On the soils in question, Wagner's generalisation, that ammonium sulphate is only 75% as effective as sodium nitrate, clearly does not hold, and the author is of opinion that results similar to his own would commonly be obtained elsewhere.

E. J. R.

Plot Experiments on the New Nitrogenous Manures. HJALMAR VON FEILITZEN (*Bied. Zentr.*, 1908, 37, 659—663; from *Svenska Mosskulturförening. Tidskr.*, 1908, 91—108).—Calcium nitrate produced higher yields of potatoes and of starch than potassium nitrate both on incompletely humified *Sphagnum* soil deficient in nitrogen, and on peat soil rich in nitrogen. Similar experiments with oats grown in sandy peat gave similar results.

Experiments in which different varieties of potatoes were grown in sandy soil, and manured respectively with sodium nitrate and two calcium cyanamide preparations, showed that, whilst the plants manured with cyanamide developed somewhat better than those on the nitrate plots, the final yields both of potatoes and starch were highest where nitrate had been supplied.

N. H. J. M.

Analytical Chemistry.

A Shortened Burette. F. TSCHAPLOWITZ (*Zeitsch. anal. Chem.*, 1908, 47, 697—698).—The apparatus consists of two 25 c.c. burettes connected at their lower end with a single tap. When the contents of one of the burettes has been run off through the tap, a half-turn of the latter enables the contents of the second burette to be used.

W. P. S.

Combined Wash-bottle and Pipette. J. W. HOGARTH (*J. Roy. Soc., New South Wales*, 1905, 38, 418—420).—A modified wash-bottle by means of which it is possible to deliver an exactly measured volume of liquid.

P. H.

Destruction of Organic Substances. M. KERBOSCH (*Pharm. Weekblad*, 1908, 45, 1210—1213).—The author emphasises the importance of the absence of organic matter in testing for metallic

poisons, and describes a method for destroying it by heating the material with a mixture of sulphuric acid and nitric acid. The method has been applied to milk, peas, meat, and sardines.

A. J. W.

The Use of Nitrous Acid, Nitrites, and Aqua Regia in the Estimation of the Mineral Constituents of Urine. JOSEPH H. KASTLE (*Amer. J. Physiol.*, 1908, 22, 411—422).—The difficulty of incinerating urine completely is well known. If, however, the urea is first got rid of by heating with sodium nitrite, nitrous acid, or aqua regia, incineration is rapidly accomplished, and the inorganic constituents of the ash can be estimated accurately. Each of the three reagents mentioned has special advantages in certain cases.

W. D. H.

Action of Thiosulphate on Permanganate in Alkaline Solution. HEINRICH KILIANI (*Chem. Zeit.*, 1908, 32, 1018).—Reinige proposed to estimate alkali iodides by titration with permanganate (conversion into iodate), and to estimate the excess by means of thiosulphate, when tetrathionate was supposed to be formed. The author, having received a private communication from Herms, has had the matter investigated, and now states that in the oxidation of thiosulphate in alkaline solution, sulphate is formed. Hence, when using Reinige's process, it must be remembered that 8 mols. of potassium permanganate do not require 24, but only 3, mols. of sodium thiosulphate for decolorisation.

L. DE K.

Estimation of [Organic] Sulphur by Carius' Method. ERWIN RUPP (*Chem. Zeit.*, 1908, 32, 984).—It is recommended to add barium chloride when oxidising the substance with nitric acid instead of adding it when the oxidation is finished. The barium sulphate thus obtained is of a coarse structure, and consequently readily washed and collected. It must be remembered that it always contains barium nitrate, from which it may be freed by boiling with a 150—200 c.c. of water, any large particles being broken up with a glass rod.

L. DE K.

Volumetric Estimation of Sulphuric Acid. THOMAS COCKSEY (*J. Roy. Soc., New South Wales*, 1907, 41, 215—217).—The author has improved the titration of barium and calcium salts by means of $N/10$ sodium carbonate and phenolphthalein as indicator, by adding alcohol in such quantity that, after the experiment is finished, the liquid will contain about half its bulk of it. Before titrating, the liquid must, if necessary, be rendered neutral to phenolphthalein with potassium hydroxide. The barium or calcium carbonate is immediately precipitated, and the end reaction becomes very distinct.

Sulphates (if necessary, freed from metals other than alkalis) are estimated conveniently by adding to the carefully-neutralised solution a definite amount of barium chloride, the excess of which is then estimated by the above process.

L. DE K.

Modification of Hüfner's Method for the Volumetric Estimation of Nitrogen. VICTOR VON CORDIER (*Zeitsch. anal. Chem.*, 1908, 47, 682—687).—The apparatus used consists of a cylindrical bulb with a long neck, which is provided with a side-tube, the whole being similar to a Victor Meyer's vapour density apparatus. The bulb has a capacity of about 100 c.c., and is fitted with a stoppered tubulure for introducing the sodium hypobromite solution. A second bulb is also provided, and serves as a reservoir for a further quantity of the solution; it is attached to the main bulb by a tapped tube, which enters the shoulder of the main bulb, and also at its top by a second tapped tube, which is connected with the neck of the apparatus. About 50 c.c. of Knop's (sodium hypobromite) solution are placed in the main bulb, and about 40 c.c. in the reserve bulb. When required, this portion of the solution is allowed to enter the main bulb by opening both the taps. The use of the apparatus enables a larger quantity of substance to be taken for the estimation, and results of experiments are given showing that the method may be used for the estimation of nitrogen in guanidine picrate, urea nitrate, acetylurea, ammonium platinichloride, &c. W. P. S.

Estimation of Ammonia in Urine. A. RONCHÈSE (*Bull. Soc. chim.*, 1908, [iv], 3, 840. Compare *Abstr.*, 1907, ii, 651).—A claim for priority against Malfatti (this vol., ii, 531). E. H.

Presence of Nitrite and Ammonia in Well-water and Its Signification. J. VAN EYK (*Pharm. Weekblad*, 1908, 45, 1162—1165).—At the ordinary temperature, zinc reduces nitrates in aqueous solution to nitrites, and then to ammonia. The author considers that nitrates in well-water may be reduced to nitrites by the zinc employed to galvanise the iron pipes of water pumps. A. J. W.

Estimation of Phosphorus, Sulphur, and Silicon in Acetylene. ADOLF FRAENCKEL (*Chem. Zentr.*, 1908, ii, 643—644; from *J. Gasbeleuchtung*, 1908, 51, 431—435).—The acetylene generated from a known weight of calcium carbide is burnt in a special apparatus, and the products of combustion are drawn through sodium hypobromite solution.

On evaporating to dryness with addition of hydrochloric acid, the silica is obtained; in the filtrate from this, the phosphoric acid is estimated as usual with magnesia mixture. Sulphur is estimated similarly by passing the products of combustion through sodium hypobromite and estimating the sulphuric acid formed as usual.

L. DE K.

Estimation of Phosphoric Acid by Lorenz's Method. OTTOKAR FALLADA (*Chem. Zentr.*, 1908, ii, 827—828; from *Osterr.-ung. Zeitsch. Zucker-Ind. Landw.*, 1908, 37, 333—336).—Lorenz's method (direct weighing of the yellow precipitate) is recommended, and will be found useful for the estimation of citrate-soluble phosphoric acid.

L. DE K.

Estimation of Arsenic in Iron Ores. MARCEL GUEDRAS (*Chem. Zentr.*, 1908, ii, 444; from *Rev. gener. Chim. pure appl.*, 1908, 11, 251—253).—One gram of the finely-powdered ore is boiled in a 500 c.c. flask with 150 c.c. of hydrochloric acid and 5 grams of stannous chloride, and the distillate is collected in a graduated 100 c.c. receiver containing 50 c.c. of water.

When 40 c.c. have passed over, the distillate is nearly neutralised, a few grams of sodium hydrogen carbonate are added, and the arsenic is titrated as usual with standard iodine.

L. DE K.

Apparatus for the Estimation of Carbon in Iron. MAX WIDEMANN (*Chem. Zentr.*, 1908, ii, 724—725; from *Zeitsch. Chem. Apparatenkunde*, 1908, 3, 296).—An improved flask and condensation arrangement. The essential improvement consists in the condensing tube being fitted with 5 bulbs. The gaseous products escape through a side-tube. The tube carrying off the water is fitted with a funnel, in which the water rises in case of sudden pressure, thus preventing the tube from cracking.

L. DE K.

Simultaneous Estimation of Carbon, Hydrogen, and Nitrogen, &c., in Organic Compounds by the Method of Simplified Elementary Analysis. MAX DENNSTEDT and F. HASSLER (*Ber.*, 1908, 41, 2778—2782).—Oxygen, prepared by heating potassium permanganate, passes through a sulphuric acid tube, through one limb of a T-piece, and through a soda-lime-calcium chloride tube into the bifurcated entry-tube of the combustion apparatus. Through the other limb of the T-piece, oxygen is driven into a weighted rubber bag (15 kilo. per 300 sq. cm.) which acts as a reservoir, by which the current of oxygen during the combustion can be adjusted to a nicety. The combustion tube and absorption apparatus are arranged as usual. To absorb oxygen, a 1 litre Erlenmeyer flask is provided with a two-holed stopper, through which one tube, passing to the bottom of the flask, is connected with an ordinary pressure-adjusting bulb, whilst a capillary T-piece, passing just through the other hole, is connected by one limb with the combustion apparatus, a safety bottle being inserted to prevent back-suction; the other limb of the T-piece, provided with rubber tubing and a pinch-cock, serves as a gas-exit.

The best absorbent of oxygen is cuprous chloride in hydrochloric acid containing pieces of copper gauze. The solution is prepared best from copper sulphate and an excess of hydrochloric acid, as the presence of sulphuric acid increases the rate of absorption of the oxygen. The solution is efficient so long as copper gauze remains undissolved.

The expulsion of air from the whole apparatus requires one to one and a-half hours. At the completion of the combustion the nitrogen is swept into the Erlenmeyer flask for about twenty minutes; after standing overnight, the nitrogen is measured in a Hempel burette. Any nitrogen retained as lead nitrate by the lead peroxide must be extracted by 33% alcohol, the solution evaporated, and the residue of lead nitrate weighed. Sulphur and the halogens are estimated as described in previous communications.

The method is most suitable for the analysis of costly substances, difficult to obtain pure. C. S.

Volumetric Estimation of Sodium Hydroxide in the Presence of Sodium Carbonate. A. C. ANDERSEN (*J. Pharm. Chim.*, 1908, 28, 370—371; from *Tidskr. Kem. Farm. Terapi*, 1908, 11, 161).—This estimation is generally carried out by adding barium chloride, which precipitates the carbonate and leaves the hydroxide; the latter is then titrated with standard acid and phenolphthalein as indicator. But in order to obtain trustworthy results, the author proposes the following slight modification.

After operating in the manner described, another portion of the solution is taken, and sufficient standard acid is added to neutralise the greater part of the hydroxide. The liquid is then heated to boiling, and a slight excess of barium chloride solution is added. When the liquid has cooled (the flask being closed), the titration is continued with phenolphthalein as indicator. L. DE K.

Ready Means of Comparing Sodium Carbonate and Oxalic Acid Solutions. A. TIAN (*Chem. Zentr.*, 1908, ii, 636; from *Rev. gen. Chim. pure appl.*, 1908, 11, 208).—The process is based on the fact that oxalic acid liberates the mineral acid from a calcium salt. A measured amount of the oxalic acid solution to be tested is mixed with an excess of calcium chloride, and the turbid liquid titrated with sodium carbonate solution, using helianthin as indicator.

L. DE K.

Estimation of Small Amounts of Barium in Rocks. RALPH W. LANGLEY (*Amer. J. Sci.*, 1908, [iv], 26, 123—124).—The author estimates small amounts of barium in rocks by precipitation with sulphuric acid immediately after the separation of silica. It is necessary to re-dissolve the barium sulphate in concentrated sulphuric acid, and to precipitate it with water, in order to free it from ferric and other sulphates. If barium is not removed as sulphate, it is precipitated as phosphate, and introduces an error in the estimation of magnesium. R. J. C.

Separation of the Metals which are Precipitated by Hydrogen Sulphide. H. BOLLENBACH (*Zeitsch. anal. Chem.*, 1908, 47, 690—693).—The metals which are precipitated by hydrogen sulphide, and are insoluble in ammonium sulphide, namely, mercury, lead, bismuth, cadmium, and copper, may be separated from each other by the following method. The precipitated sulphides are treated with nitric acid, when all but the mercury goes into solution. Ammonium persulphate is added to the solution, then a considerable excess of ammonia, and the mixture is boiled. Lead and bismuth are precipitated and removed by filtration. The precipitate is dissolved in concentrated hydrochloric acid; one portion of the solution is rendered ammoniacal, then acidified with acetic acid, and tested with potassium dichromate, a yellow precipitate denoting the presence of lead (bismuth chromate is readily soluble in acetic acid).

A second portion of the hydrochloric acid solution is treated with stannous chloride, and sufficient sodium hydroxide is added to redissolve the stannous hydroxide. A black precipitate shows that bismuth is present. The filtrate from the lead and bismuth peroxides is boiled with hydrochloric acid to decompose the ammonium persulphate, and then rendered ammoniacal. A blue coloration denotes the presence of copper. The blue solution is then treated with potassium cyanide and hydrogen sulphide, when a yellow precipitate is obtained if cadmium is present.

W. P. S.

Electrolytic Estimation of Thallium and Probable Existence of a New Oxide of this Metal. GINO GALLO and G. CENNI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 276—284).—When a solution of thallous sulphate, slightly acidified with sulphuric acid, is electrolysed, the whole of the thallium is deposited on the anode in the form of an oxide, generally supposed to be the sesquioxide. It was found, however, by Heiberg (*Abstr.*, 1903, ii, 614) that, when the deposit of oxide is heated in order to dry it, its weight at first diminishes and subsequently increases, this increase being supposed by him to be due mainly to the action on the oxide of sulphur dioxide from the gas heating the oven, whilst Werther (*J. pr. Chem.*, 1864, 91, 385) regarded it as being caused by the absorption of carbon dioxide. The authors find that the minimum weight of the deposit is greater than that of the sesquioxide corresponding with the amount of thallium employed, their results indicating that the sesquioxide is converted into an oxide of the composition Tl_3O_5 . The oxide Tl_3O_5 is probably transformed partly into TlO_2 , which, with Tl_2O_3 , gives the compound Tl_3O_5 . The formation of such an oxide is not surprising, considering the position of thallium between mercury and lead in the periodic system, and also the existence of mercury peroxide (compare Antropoff, *Zeitsch. Elektrochem.*, 1906, 12, 585; Pellini, *Gazzetta*, 1908, 38, i, 71).

The best procedure for the quantitative, anodic deposition of thallium as oxide is to dissolve thallous sulphate in about 100 c.c. of water in a Classen capsule, the solution being acidified by the addition of about 0.1 gram of oxalic acid, and electrolysed at the ordinary temperature with a platinum disk rotating at 800 revs. per minute as negative electrode; the voltage should be 3—4, and the current density, 0.15—0.20 ampere. The end of the electrolysis is ascertained by adding a little water so as to raise the level of the liquid in the capsule; no deposit should appear on the clean platinum surface thus freshly brought into contact with the solution. The weight of the deposit, after drying at 160—200°, corresponds with the formula Tl_3O_5 , and, when dissolved in hydrochloric acid, the oxide causes evolution of chlorine and forms the chloride, $TlCl_3 \cdot 3TlCl$. The oxide hence decomposes according to the equation:

and the authors regard it as having the structure

T. H. P.

Analysis of a Mineral containing Copper, Bismuth, Lead, Silver, Calcium, Iron, and Quartz. AUGUST CHWALA and V. MACRI (*Chem. Zentr.* 1908, ii, 261; from *Mon. Sci.*, 1908, [iv], 22, 372).—The mineral is decomposed by means of nitric acid and potassium chlorate, and a solution of ammonium nitrate is added to keep lead and calcium sulphates in solution. The siliceous matter is then collected and washed, first with a hot acid and then with a hot ammoniacal solution of ammonium nitrate. After removing any silver from the filtrate by means of hydrochloric acid, sulphuric acid is added, and then excess of ammonia, which precipitates the iron only; this is washed first with an acid and then with an ammoniacal solution of ammonium nitrate. The bismuth is then precipitated with ammonium carbonate, and, finally, the copper and lead are separated as usual.

L. DE K.

Solubility of Rare Earth Oxalates in Solutions containing Uranyl Salts. OTTO HAUSER (*Zeitsch. anal. Chem.*, 1908, 47, 677—680).—It is pointed out that uranyl salts have a considerable solvent action on cerium and lanthanum oxalates, and, unless a considerable excess of oxalic acid is added, the results obtained in the usual method of precipitating these earths as oxalates are untrustworthy, if uranyl salts are present.

W. P. S.

Separation of the Metals of the Ammonium Sulphide Group. ERICH EBELER (*Zeitsch. anal. Chem.*, 1908, 47, 665—677).—The following process of separating the metals precipitated by ammonium sulphide is recommended. The precipitate, consisting of iron, manganese, nickel, cobalt, and zinc sulphides, and aluminium and chromium hydroxides, is boiled with hydrochloric acid until all the hydrogen sulphide has been expelled, then oxidised with nitric acid, and treated with hydrogen peroxide and sodium hydroxide. The precipitate, which contains the iron, manganese, nickel, and cobalt, is separated by filtration, dissolved in hydrochloric acid, hydrogen peroxide is added, and the iron and manganese are precipitated with ammonia; these two metals are separated from their hydrochloric acid solution by the addition of ammonium chloride, hydroxylamine hydrochloride, and ammonia, the iron being precipitated, whilst the manganese remains in solution. The nickel and cobalt are separated by adding dicyanodiamide and potassium hydroxide to the filtrate containing them; the nickel is precipitated as a crystalline compound. The filtrate containing the aluminium, chromium, and zinc is boiled, and ammonium chloride is added repeatedly until ammonia ceases to be given off; the aluminium hydroxide thus precipitated is removed by filtration, and the filtrate is treated with sulphurous acid after acidifying with hydrochloric acid. The addition of ammonia to the hot solution precipitates the chromium, leaving the zinc in solution.

W. P. S.

Estimation of Iron, Alumina, and Phosphoric Acid in Presence of Each Other. THOMAS COCKSEY (*J. Roy. Soc., New South Wales*, 1907, 41, 163—171).—The acid solution is mixed with a definite

amount of a standard solution of sodium dihydrogen phosphate, and potassium hydroxide solution is added until the liquid is neutral to methyl-orange. The whole is diluted to 80—90 c.c., and heated on the water-bath until the precipitate has settled. To the filtrate is added an excess of calcium chloride, the liquid is acidified slightly with $N/10$ acid, boiled to expel carbon dioxide, and the free phosphoric acid is titrated with $N/10$ potassium hydroxide, using phenolphthalein as indicator, as soon as the liquid is neutral to methyl-orange; 1 c.c. = 0.00355 gram of P_2O_5 .

The iron oxide is determined iodometrically, and calculated to ferric phosphate. This deducted from the weight of the first precipitate gives the aluminium phosphate, which is then calculated to alumina. From the total phosphoric acid found, is then deducted the amount purposely added.

L. DE K.

Separation of Iron from Nickel and Cobalt by Lead Oxide. T. H. LABY (*J. Roy. Soc., New South Wales*, 1904, 37, 157).—After trying the separation by means of ammonium hydroxide and chloride, ammonium carbonate, the basic acetate process, the phosphate method, the electrolytical separation, and the ether extraction process, the author finally calls attention to a process given by Field (*Chem. News*, 1859, 1, 5), which he finds is also suitable for the separation of iron from cobalt.

In this process the iron is precipitated as hydroxide by evaporating the nitrate solution with excess of lead oxide; the lead is separated readily from the filtrate with sulphuric acid. The nickel or cobalt is then estimated electrolytically in ammoniacal solution.

L. DE K.

Detection of Cobalt in the Presence of Large Quantities of Nickel. M. EMMANUEL POZZI-ESCOT (*Ann. Chim. anal.*, 1908, 13, 390—391).—Supposing the amount of nickel to be about 1000 times that of the cobalt, the solution containing about 10 grams of the nitrates is concentrated to 25—50 c.c. and mixed while hot with 50 grams of ammonium molybdate dissolved in a little boiling water. When cold, the liquid is filtered from the nickel precipitate, and the rose colour of the cobalt becomes visible. On boiling with excess of sodium hydroxide and a little hydrogen peroxide, the cobalt is obtained as a brown oxide, which may then be identified by means of the borax bead.

L. DE K.

Approximate Colorimetric Estimation of Cobalt and Nickel in the Presence of Each Other. R. W. CHALLINOR (*J. Roy. Soc., New South Wales*, 1905, 38, 406—417).—The two metals are estimated jointly by electrolysis, and then dissolved in dilute nitric acid (1:1). After evaporating nearly to dryness, the mass is dissolved in water and diluted to a known volume. If the liquid is green, more than 76% of nickel is present; an aliquot portion of the liquid, containing 0.04—0.05 gram of the mixed metals, is taken, and a standard solution of cobalt is run in until the colour (after diluting to the 50 c.c. mark) is equal to that of a standard solution containing the nearest weight of the mixed metals. If, however, the solution is pink, showing

the presence of more than 24% of cobalt, standard nickel is run in, any excess of which may be again checked with cobalt.

After allowing for nickel added, the amount of nickel in the mixture is readily calculated.

L. DE K.

Iodometric Estimation of Chromic and Vanadic Acids in the Presence of Each Other. GRAHAM EDGAR (*Amer. J. Sci.*, 1908, [iv], 26, 333—336).—The mixed acids (about 0.2 gram) are boiled with 15 c.c. of hydrochloric acid and 2 grams of potassium bromide in a Voit flask, a slow current of hydrogen is passed, and the bromine evolved, owing to the reduction of 2CrO_4 to Cr_2O_3 and V_2O_5 to V_2O_4 , is absorbed in an alkaline solution of potassium iodide contained in a Drexel bottle connected with a Will and Varrentrap trap, also containing the same solution. After the operation is over, the potassium iodide solution is acidified with hydrochloric acid, and the iodine set free titrated as usual. The Drexel bottle is then filled with fresh potassium iodide solution.

To the contents of the Voit flask are now added 2 grams of potassium iodide, 15 c.c. of hydrochloric acid, and 3 c.c. of syrupy phosphoric acid, and the distillation is repeated as before in a current of hydrogen. The hydriodic acid acts on the V_2O_4 , reducing this to V_2O_3 with liberation of iodine, which is absorbed in the Drexel bottle and titrated as usual. The second titration therefore gives the vanadic acid only, and the difference between the first and second gives the necessary data for the calculation of the chromic acid.

L. DE K.

Tin. DAVID B. DOTT (*Pharm. J.*, 1908, [iv], 27, 486).—Contrary to general belief, metastannic acid, formed by the action of nitric acid on tin, is soluble in hydrochloric acid. All quantitative processes based on the separation of silica from tin by evaporation to dryness are untrustworthy, as a large proportion of the tin volatilises as chloride. The author proposes the following method for the estimation of tin in the presence of antimony.

The solution is divided into two equal portions. In one of these, both metals are precipitated with hydrogen sulphide, and the precipitate is then converted in the usual manner into a mixture of tin and antimony dioxides. The other portion is saturated with oxalic acid, heated, and treated with hydrogen sulphide, which now precipitates the antimony only; this is then converted into dioxide and deducted from the joint weight.

Low's modification of Pearce's method for the estimation of tin in ores, by fusing with sodium hydroxide, dissolving in hydrochloric acid, reducing by boiling with iron wire, and, after filtering into a flask filled with carbon dioxide, rapidly titrating with standard iodine, gives good results.

L. DE K.

Analysis of Oxidised Antimony and Lead Sulphide Compounds. FELIX JACOBSON (*Chem. Zeit.*, 1908, 32, 984—985).—The article is mainly devoted to the assay of commercial Sulphur antimonii auratum (this vol., ii, 540).

VOL. XCIV, ii.

The process is also applicable to lead sulphide. For the estimation of free sulphur, the use of boiling chloroform is recommended.

L. DE K.

Volumetric Estimation of Bismuth. PIERRE BALAVOINE (*Zeitsch. anal. Chem.*, 1908, 47, 681).—The author mentions that previous to the publication of the results of Moser's investigation (*Abstr.*, 1907, ii, 433) on the volumetric estimation of bismuth, he had recorded the results of experiments showing that the method was untrustworthy.

W. P. S.

Analysis of Organic Mixtures with the Aid of the Refractometer. ERNST E. SUNDWICK (*Pharm. Zentr.-h.*, 1908, 49, 783—787).—Some remarks on the process of Beythien and Hennicke (this vol., ii, 72).

The author's own process is based on the following equations: (1) $V:V_1 = C_1 - B : C - B$, in which V and V_1 represent two volumes containing the same amount of dissolved matter, C the refraction of the joint solution, and B the refraction of the solvent (water, alcohol, chloroform, acetone, toluene, &c.); (2) $V(C - B) = \text{constant}$, and (3) $P(C - B)/d = \text{constant}$.

L. DE K.

Methyl Alcohol and its Impurities. FRANZ FRIEDRICH (*Chem. Zeit.*, 1908, 32, 890—891).—In examining methyl alcohol for impurities, the carbylamine test for chloroform should not be omitted, in view of the fact that methyl alcohol is sometimes treated with bleaching powder in order to remove acetone, which is thereby converted into chloroform.

P. H.

Gravimetric Alcoholometry. BLONDEAU (*Bull. Assoc. Chim. Sucr. Dist.*, 1908, 26, 148—160).—Tables are given showing the weight of alcohol per hectolitre of mixtures of alcohol and water. The values are given for each reading of the Gay-Lussac alcoholometer between 1 and 100 at temperatures from 0° to 30° (compare *Abstr.*, 1908, ii, 738).

W. P. S.

New Differential Reactions of the Naphthols. VOLER-BOUCHER (*Ann. Chim. anal.*, 1908, 13, 335—338).—The following reagents are used: Alcohol of 95° (French), a 10% solution of copper sulphate, and a 10% solution of potassium cyanide prepared just before use.

Identification of the Naphthols.—0.5 Gram of the substance is placed in a test-tube, and dissolved in the smallest possible quantity of alcohol, added drop by drop. Two c.c. of the copper solution are added, and, after thorough shaking, 4 c.c. of the cyanide. With α -naphthol an abundant, violet-red precipitate is obtained; β -naphthol yields a yellow precipitate. If now just sufficient alcohol is added to dissolve the precipitate, a rose-coloured liquid showing a violet reflection will be obtained with the α -compound, but a golden-yellow solution in the case of β -naphthol.

Identification of the Camphorated Naphthols.—A thread of the

substance is placed in a test-tube, and 2 c.c. of copper solution are added. The substance, which floats on the surface, is dissolved by cautious addition of alcohol, and 4 c.c. of the cyanide are then added. The result is the same as with the ordinary naphthols.

The same process serves for the detection of small proportions of α -naphthol in the β -compound. Benzonaphthol does not give the reaction.

L. DE K.

Estimation of Lactose by Ammoniacal Copper Salt Solutions. YOSHITAKA SHIMIDZU (*Biochem. Zeitsch.*, 1908, 13, 243—261).—Lactose can be estimated by means of the Kumagawa-Suto modification of Pavy's method, if it is first hydrolysed into dextrose and galactose. For the latter purpose, 10% sulphuric acid, or 5% hydrochloric acid, are suitable, and inversion is complete within one hour if 100 c.c. of acid is used for 0.25 to 1 gram of the sugar. The method is applicable to the estimation of sugar in milk.

S. B. S.

Precipitation of Lævulose by Basic Lead Acetate. H. C. PRINSEN-GEERLIGS (*Zeitsch. Ver. deut. Zuckerind.*, 1908, 932—936).—The results of the experiments recorded show that, whilst basic lead acetate does not precipitate lævulose from its solution when the latter contains nothing but the sugar, an appreciable quantity of the sugar is precipitated if other substances which yield insoluble lead compounds are also present. As all syrups and crude sugars give such solutions, these, when clarified with basic lead acetate, furnish filtrates containing less lævulose than the original solution. The reducing sugar precipitated is shown to be actually lævulose.

W. P. S.

Detection of Formic Acid in Honey. TH. MERL (*Zeitsch. Nahr. Genussm.*, 1908, 16, 385—389).—Formic acid is best detected in honey by heating the sodium formate, obtained on evaporating the neutralised distillate of the honey, with concentrated sulphuric acid. The carbon monoxide produced is collected over potassium hydroxide solution, and, if its volume is measured, the quantity of formic acid present may be calculated. Lactic acid, which may also be present in the distillate, yields carbon monoxide on treatment with sulphuric acid, and a portion of the distillate should therefore be oxidised with permanganate and the resulting oxalic acid estimated. The quantity of carbon monoxide due to the lactic acid is then deducted from the total volume of gas found. The calomel formed by the action of formic acid on mercuric chloride may also be employed as a measure of the amount of formic acid present, but it is pointed out that other substances present in honey distillates reduce mercuric chloride.

W. P. S.

Acidification and Distillation of Fatty Acids; Distilled Oleic Acid. HUGO DUBOVITZ (*Chem. Zentr.*, 1908, ii, 545; from *Seifensieder Zeit.*, 1908, 35, 728—729).—The acidification of the fatty acids yields, according to Benedikt, sulphostearic acid, which on boiling with water yields hydroxystearic acid. The author, however, obtained about twice the

quantity of hydroxystearic acid than would be expected, and has therefore altered Benedikt's formula for sulphostearic acid into

The presence of small quantities of neutral fat in commercial oleic acid ("distillation olein") is difficult to confirm, owing to the possible presence of anhydrides and lactones. Owing to the presence of volatile fatty acids, the estimation of water in the oleic acid should be effected in a vacuum over calcium chloride.

L. DE K.

Estimation of β -Hydroxybutyric Acid in Urine. PHILIP A. SHAFFER (*J. Biol. Chem.*, 1908, 5, 211—224).—Previous methods for the estimation of this acid are criticised. The method proposed is to distil with sulphuric acid and potassium dichromate, when under suitable conditions, the acid is converted quantitatively into acetone, which is then determined by standard iodine and thiosulphate solutions. A number of precautions, especially in estimations in urine, have to be taken.

W. D. H.

Detection and Estimation of β -Hydroxybutyric Acid in Urine. OTIS F. BLACK (*J. Biol. Chem.*, 1908, 5, 207—210).—Acetoacetic acid is recognised by the red colour produced by ferric chloride. If β -hydroxybutyric acid is tested in the same way in the presence of hydrogen peroxide, the same colour reaction is obtained. In applying the test to urine, evaporation at a gentle heat gets rid of acetoacetic acid; the residue is acidified with hydrochloric acid, and made into a paste with plaster of Paris. This is broken up and extracted with ether, the ether is evaporated, and the test applied to the residue. For quantitative purposes, the residue is extracted with water and examined with a polarimeter.

W. D. H.

Natural and Added Free Tartaric Acid in Natural Wines. H. ASTRUC and J. MAHOUX (*Bull. Soc. chim.*, 1908, [iv], 3, 840—845; *Ann. Chim. anal.*, 1908, 13, 307—315).—The method of estimating the total tartaric acid and the total potassium in a wine, and deducing therefrom the amount of free tartaric acid, gives too low a value for the latter, since the amount of potassium combined with other acids is neglected. In this manner, excessive (added) quantities of free tartaric acid in natural wines are overlooked.

The authors have estimated the total tartaric acid and potassium by the official methods, and the added tartaric acid and total potassium by other methods, in three natural wines prepared by the authors, both when untreated and after addition of variable known quantities of tartaric acid and potassium, and draw the following conclusions from their results. The official methods are liable to large errors in opposite directions, the other methods (Pasteur, Reboul, Magnier de la Source, &c.) are more trustworthy, and should therefore be preferred; it is also more accurate to ignore the estimation of total potassium, and to evaporate in the presence of potassium bromide, in order to estimate free tartaric acid. It is impossible to distinguish natural from added tartaric acid in potable wines.

The authors' results contradict the statement that natural wines from ripe grapes are necessarily always free from tartaric acid.

E. H.

Method of Estimating Succinic Acid in Fermented Liquids containing Other Fixed and Volatile Acids. M. EMMANUEL POZZI-ESCOT (*Compt. rend.*, 1908, 147, 600—601; *Bull. Assoc. chim. Sucr. Dist.*, 1908, 26, 185—186 *).—The following method is stated to be trustworthy for the separation and estimation of succinic acid in solutions containing colouring matters, tannin, proteins, and fixed and volatile acids. A portion of the solution is treated with a small quantity of gelatin, neutralised with ammonia, and then rendered distinctly acid with acetic acid. Barium chloride is next added, and the precipitate, consisting of proteins, tannin, barium oxalate, barium sulphate, &c., is removed by filtration. The filtrate is boiled and treated with a considerable excess of lead acetate, which precipitates any remaining protein and tannin, and phosphoric, tartaric, and citric acids. The precipitate is collected on a filter and washed with very dilute acetic acid. The filtrate is treated with hydrogen sulphide to remove the excess of lead, and the solution is then acidified with sulphuric acid, boiled, and the malic acid is oxidised by the addition of an excess of potassium permanganate. This excess is decomposed by means of potassium hydrogen sulphite, and the sulphuric acid is removed by treatment with barium chloride. The solution is then concentrated, rendered slightly ammoniacal, and the succinic acid is precipitated by the addition of an alcoholic solution of barium bromide, a quantity of alcohol equal to three times the volume of the total solution being also added. The barium succinate is collected on a filter, washed with 60% alcohol, and ignited. The amount of succinic acid is calculated from the weight of barium carbonate obtained (compare this vol., ii, 904).

W. P. S.

Naphtharesorcinol as a Reagent for Certain Aldehyde and Keto-acids. JOHN A. MANDEL and CARL NEUBERG (*Biochem. Zeitsch.*, 1908, 13, 148—151).—The reaction described by B. Tollens for glycuronic acid (heating with naphtharesorcinol and hydrochloric acid, and subsequent extraction with ether) is applicable to several other substances, especially those containing certain combinations of carboxyl and carbonyl groups in the molecule. Also, certain more complex substances, such as glucothionic acid, ovomucoid, chondroitinsulphuric acid, and various nucleo-proteins, give the reaction.

S. B. S.

Separation of Benzoic Acid and Cinnamic Acid. ANNE W. K. DE JONG (*Pharm. Weekblad*, 1908, 45, 1115—1116).—Schering's process (separation of the bulk of the cinnamic acid as calcium cinnamate and oxidation of the remainder with permanganate: *Abstr.*, 1907, ii, 823) is, in the author's opinion, unsuitable for quantitative purposes, owing to the formation of benzoic acid.

L. DE K.

* and *Ann. Chim. anal.*, 1908, 13, 439—440.

Süchting's Method for Estimating Acidity of Soils. BR. TACKE and H. SÜCHTING (*J. pr. Chem.*, 1908, [ii], 78, 139—142).—Mainly polemical. A reply to van Schermbeck (this vol., ii, 743).
J. J. S.

Humic Acid. A. J. VAN SCHERMBECK (*J. pr. Chem.*, 1908, [ii], 78, 285—288. Compare this vol., ii, 743).—A reply to Tacke and Süchting (preceding abstract), and a further criticism of these authors' methods.
G. Y.

Colour Reactions of Sesamé Oil with (a) Aromatic Aldehydes and (b) Various Sugars. The Similar Reactions with Biliary Acids. C. FLEIG (*Bull. Soc. chim.*, 1908, [iv], 3, 984—991, 992—999).—The suggestion has been made (Mylus, *Abstr.*, 1887, 1149) and denied (Ville, *Abstr.*, 1907, ii, 913) that the red or violet colorations formed in the Pettenkofer test for biliary acids, and in the Camoin-Baudouin test for sesamé oil, depend on the formation of furfuraldehyde by the action of the sulphuric or hydrochloric acid on the sucrose used. The author has therefore tried to obtain definite data on this point by using (1) various aromatic aldehydes and (2) polyhydric alcohols and sugars in place of sucrose, and the results, on the whole, support Mylius' contention. It is suggested that the differences in colour produced in using furfuraldehyde instead of sucrose, as noted by Ville, may be due to secondary influences exerted by other hydrolytic products formed when sucrose is used.

Of the thirteen aldehydes tried, *p*-hydroxybenzaldehyde, anisaldehyde, protocatechualdehyde, vanillin, piperonal, and cinnamaldehyde give colours as intense as those yielded by furfuraldehyde, whilst benzaldehyde, salicylaldehyde, *o*-nitrobenzaldehyde, and *p*-dimethylaminobenzaldehyde yield less intense tints, and *m*- and *p*-nitrobenzaldehyde and cuminaldehyde are still less satisfactory.

The polyhydric alcohols and sugars tried as substitutes for sucrose in the Camoin-Baudouin reaction fall into the following five groups, in order of decreasing intensity of colour produced: (a) *lævulose*, invert sugar, sucrose, sorbose; (b) raffinose; (c) xylose, arabinose; (d) galactose, mannose, mannitol, dextrose; (e) *isodulcitol*, erythritol, sorbitol, dulcitol, lactose, maltose, glycerol. All the sugars in this list, except arabinose, were also tried in the Pettenkofer test, and gave similar results.

In both tests the production of colour is expedited by warming the mixture slightly; hydrochloric acid may be used in place of sulphuric acid or vice versa, but in some cases the former acid is advantageous. In the tests for sesamé oil, an alcoholic extract of the oil may be used in place of the oil itself. Full details are given in the two papers as to the exact methods employed in making the tests. The second paper concludes with a summary of the literature dealing with the constituent of sesamé oil to which the production of the colour is due, and the conclusion is drawn that this coloration may be due to the presence of a number of different substances.
T. A. H.

Formation of Formaldehyde in Solutions of Sugar. A. ALEXANDER RAMSAY (*J. Roy. Soc., New South Wales*, 1907, 41, 172—175).—Attention is called to the fact, noticed amongst others by the

author, that small quantities of formaldehyde are formed during the heating or distillation of saccharine liquids (jams, for instance); thus upsetting the value of some tests recommended for the detection of added formalin.

L. DE K.

Identification of Thujone in Liqueurs. LOUIS DUPARC and A. MONNIER (*Ann. chim. anal.*, 1908, 13, 378—382).—The liqueur is submitted to distillation, and 10 c.c. of the distillate (which should be of 60° alcoholic strength) is mixed with 2 c.c. of 10% zinc sulphate, 0.5 c.c. of 10% sodium nitroprusside, and then with 4 c.c. of 5% sodium hydroxide free from carbonate. After the lapse of one minute, 2 to 3 c.c. of glacial acetic acid are added, when, after a few minutes, a very characteristic, dark red precipitate forms if thujone is present.

The author has examined altogether fifty-four different essences (2 parts dissolved in 1000 parts of alcohol), and, with the exception of thujone, they yielded white or yellow precipitates; those which contained citral, however, gave an orange-red deposit.

L. DE K.

Analysis of Scammony Resins. P. GUIGUES (*Bull. Soc. chim.*, 1908, [iv], 3, 872—878).—The ether assay of scammony resin advocated by the *Codex Medicamentarius* is unsound, since (1) the resin of jalap is partly soluble in ether, whilst some resins from scammony are incompletely soluble in this solvent; (2) it permits the substitution of fusiform jalap resin, soluble in ether, for the true scammony resin; (3) it prevents the recognition of foreign resins, particularly colophony, soluble in ether; and (4) it is subject to numerous errors, and does not give constant results.

The solubility of scammony resin is not appreciably altered by boiling with water or with 10% hydrochloric acid for several hours. Assay of the resin by turpentine instead of ether is no more successful. The author proposes to detect adulteration by determination of the rotatory power. The following are the values obtained for the optical activities of resins: Commercial Tampico jalap, $-34^{\circ}20'$; true Orizaba jalap, $-24^{\circ}45'$; officinal jalap, -36° ; officinal turbith, $-30^{\circ}10'$ to $31^{\circ}35'$; ordinary colophony, $+6^{\circ}$ to $+7^{\circ}$; sandarac from the Arabic bazaar, $+46^{\circ}20'$; pure sandarac, $+31^{\circ}$ to $+34^{\circ}$; recent mastic, $+29^{\circ}30'$; second quality mastic, $+21^{\circ}50'$; guaiacum, -17° . For scammony, the author obtained $-24^{\circ}30'$ as a maximum from the resin extracted from the gum-resin, and $-18^{\circ}30'$ to $-23^{\circ}30'$ for resins extracted from the roots. The rotatory power is independent of the solubility in ether. These values show that only the Orizaba jalap (fusiform) resin and guaiacum resin can be used as adulterants. Since only the scammony resins extracted from the gum resin, which are at least twice as expensive as that extracted from the root, have rotatory powers as high as $-24^{\circ}30'$, a resin having α_D higher than $-23^{\circ}30'$ is most probably fusiform jalap resin. Guaiacum resin should be readily detected by its chemical characteristics.

E. H.

Detection of Arbutin in Plants. MILLE A. FICHTENHOLZ (*J. Pharm. Chim.*, 1908, [vi], 27, 255—262).—In applying Bourquelot's method (*Abstr.*, 1902, ii, 55) to the detection of glucosides in plants,

it is necessary to allow the emulsin to act on the plant extract during several days, as the action of the ferment is frequently slow, owing to the presence of tannic or gallic acids, which retard its activity. In the case of such glucosides as arbutin, which has a high levorotation, it is advantageous to defecate the plant extract with lead acetate before adding emulsin. Bearberry leaves contain at least 1.66% of arbutin.

T. A. H.

Volumetric Estimation of Potassium Ferrocyanide. H. BOLLENBACH (*Zeitsch. anal. Chem.*, 1908, 47, 687—690).—The following modification of de Haën's process was found to give trustworthy results. The potassium ferrocyanide solution is acidified with sulphuric acid, and an excess of *N*/10 permanganate solution is added. After the addition of a few drops of ferric sulphate solution, the excess of permanganate is titrated with *N*/10 ferrocyanide solution. Each drop of the latter added produces a greenish-blue precipitate, which disappears on shaking, as long as any permanganate remains.

W. P. S.

Detection and Estimation of Hexamethylenamine in Pharmaceutical Mixtures. WILLIAM A. PUCKNER and W. S. HILPERT (*J. Amer. Chem. Soc.*, 1908, 30, 1471—1474).—The process is based on the fact that hexamethylenamine does not suffer decomposition on boiling with aqueous potassium hydroxide, but that it is converted into formaldehyde and ammonium sulphate on boiling with dilute sulphuric acid. The ammonia formed is then readily estimated, any ammonia pre-existing in the sample under examination being removed by the preliminary alkaline treatment.

The reactions with mercuric chloride and with bromine are also useful in the identification of hexamethylenamine. Advantage may also be taken of its solubility in chloroform.

L. DE K.

Estimation of the Total Alkaloids in Cinchona Barks. N. H. COHEN (*Pharm. Weekblad*, 1908, 45, 1089—1098).—A modification of Florence's method (*Abstr.*, 1907, ii, 317). Five grams of the very fine powder are placed in a small corked flask, 125 grams of ether and 5 c.c. of 15% sodium hydroxide are added, and the whole is weighed. After shaking vigorously every five minutes for an hour, the flask is fitted to a vertical condenser, and the contents are boiled for half an hour. When cold, ether is added to restore the original weight, 5 c.c. of water are introduced, and, after thorough shaking, the ether is transferred to a 250 c.c. flask. Twenty c.c. of lime water are added, the flask is closed, preferably with the same cork, and the whole thoroughly shaken. One hundred c.c. of the ether are now drawn through a plug of cottonwool into a weighed 200 c.c. flask, the ether is distilled off, and the residual alkaloids dried for one and a-half hours at 100° and weighed. The weight $\times 25 =$ percentage of alkaloids, about 0.5 of which consists of impurities. These may be estimated by dissolving the alkaloids in 10 c.c. of 2% sulphuric acid and shaking the solution with ether, which is then evaporated in a weighed flask.

Florence's estimation of the quinine by means of *N*/10 ethereal oxalic acid cannot be recommended.

L. DE K.

The Quantitative Relations of the Thalleoquinine Reactions.

JOS. VONDRASEK (*Chem. Zentr.*, 1908, ii, 833—834; from *Pharm. Post*, 1908, 41, 605—607).—The author recommends that the test for quinine should be carried out as follows: 0.01 gram of the quinine salt is dissolved in a mixture of 1 c.c. of *N* hydrochloric acid and 2 c.c. of *N*/10 potassium bromate, and boiled until the liquid turns orange-yellow. When cold, 1—2 c.c. of ammonia are added, and a dark green solution is obtained. Quinidine also gives the test. In this reaction, three atoms of chlorine are taken up by 1 mol. of quinine. The test may be also carried out in the cold, when addition of ammonia will give a dark green precipitate and a dark green liquid. On adding alcohol, a solution is obtained which is suitable for the colorimetric estimation of quinine.

Quinine and quinidine may be distinguished from cinchonine and cinchonidine by heating the aqueous solutions with excess of potassium bromate, which yields a blue liquid. The colour is destroyed on adding acid.

L. DE K.

Assay of Coca. ANNE W. K. DE JONG (*Chem. Weekblad*, 1908, 5, 645—647).—A reply to M. Greshoff (this vol., ii, 441). The author gives experimental results in support of the contention that Greshoff's method of estimating coca is untrustworthy, and attributes this to decomposition caused by heating the alkaloid salts in aqueous solution (compare Abstr., 1905, ii, 778; this vol., ii, 440).

A. J. W.

Assay of Coca. MAURITS GRESHOFF (*Chem. Weekblad*, 1908, 5, 705—706. Compare this vol., ii, 441).—Polemical. A final reply to de Jong (preceding abstract).

L. DE K.

Detection of Vegetable Poisons in Decomposed Animal Bodies. THEODOR PANZER (*Zeitsch. anal. Chem.*, 1908, 47, 572—590).—Corpses which have undergone a considerable amount of decomposition may contain substances which yield general reactions similar to those given by the alkaloids. These substances, which are chiefly found in the brain, and to a less extent in the liver and kidneys, do not give the characteristic reactions of the separate alkaloids. If a residue is obtained from the ethereal extract of the alkaline solution obtained in the usual way (Stas-Otto method) from the organs under examination, which residue gives general alkaloidal reactions, the solution of the residue should be rendered acid with hydrochloric acid and extracted with ether; this treatment removes the substances, and the aqueous solution is then examined for alkaloids. If possible, it is preferable not to mix the brains with the other organs of the body under examination.

W. P. S.

Process for the Valuation of Saffron. BALTHASAR PFYL and W. SCHEITZ (*Zeitsch. Nahr. Genussm.*, 1908, 16, 347—352).—The

process depends upon the estimation of the amount of sugar formed by the hydrolysis of the glucoside soluble in chloroform, which the authors have shown occurs in saffron (this vol., ii, 979). Saffron is dried, powdered, and re-dried, and 5 grams of the preparation extracted in a Soxhlet apparatus with light petroleum and, after drying, re-extracted with dry chloroform. The solvent is evaporated from the chloroformic extract, and the residue dissolved as far as possible in acetone. The latter is evaporated, and the glucoside in the residue hydrolysed by adding 5 c.c. of *N*-hydrochloric acid and heating during fifteen minutes, water being added as required to bring the total amount of liquid up to 25 c.c. The filtrate from this is neutralised with *N*-alkali, and the sugar estimated by Allihn's method.

The best quality of commercial saffron, consisting only of the stigmas of the saffron crocus, yields in this way 0.1996 to 0.2090 gram of metallic copper, and samples yielding less than this may be regarded as having an unduly large proportion of styles included, or as containing constituents foreign to the saffron crocus. The quantity of adulterant present is not directly proportional to the diminution in the amount of copper obtained, since the latter is, in part, dependent on the concentration of sugar solution used, and a table is supplied in the original from which, by a method of interpolation, the quantity of "real saffron" present in a sample can be calculated from determinations made by the above process. Trials with the usual adulterants of saffron, namely, saffron crocus styles, logwood, red poppy petals, red peony petals, honey, marigold petals, safflower, Cape saffron, and Spanish thistle flowers, show that each of these products, when subjected to this process, yields practically no reducing substance, and that with turmeric and red sandalwood very much smaller quantities of copper are obtained than with real saffron.

T. A. H.

Detection of Proteins by means of Formaldehyde. LEO VON LIEBERMANN (*Zeitsch. Nahr. Genussm.*, 1908, 16, 231).—Five c.c. of the solution to be tested are treated with one drop of 40% formaldehyde solution and one drop of very dilute ferric chloride solution. The mixture is then allowed to flow over the surface of 5 c.c. of concentrated sulphuric acid. If protein (albumin or albumose) is present in the solution, a violet ring is observed at the junction of the two liquids.

W. P. S.

A New Reaction for Bile Acids. ADOLF JOLLES (*Zeitsch. physiol. Chem.*, 1908, 57, 30—34; *Ber.*, 1908, 41, 2766).—If a few drops of a 5% solution of rhamnose are warmed with a similar amount of a 0.1% solution of taurocholate or glycocholate, and a few drops of concentrated hydrochloric or sulphuric acid, a momentary red coloration is obtained, which passes in a short time into a green fluorescence. This test is given also by cholic acid, but not by glycine or taurine. The delicacy of the test is very considerable. In employing it to detect bile acids in urine, the fluid is first mixed with a solution of caseinogen, and the latter is precipitated by careful

addition of sulphuric acid and filtered off. The precipitate is digested with absolute alcohol at room temperature for an hour, filtered, and the reaction tried with the filtrate. Cholesterol, albumin, urea, carbohydrates, higher hydrocarbons, and acids of the fatty and benzene series do not give the test.

W. D. H.

A Colour Reaction of Bile Acids with Vanillin and Sulphuric Acid. KATSUJI INOUE and HIIZU ITO (*Zeitsch. physiol. Chem.*, 1908, 57, 313—314).—If vanillin is added to an aqueous solution of bile acids, and then concentrated sulphuric acid, a red ring appears at the junction of the two liquids; on shaking up the mixture, it becomes red, then brown or yellow, and finally violet. On diluting this with glacial acetic acid, a wide absorption band at *D*, reaching to *C* on one side and *E* on the other, is seen. Tables are given showing the delicacy of the test with cholic, glycocholic, and taurocholic acids.

W. D. H.

The Lecithin-content of Milk. JOSEPH NERKING and E. HAENSEL (*Biochem. Zeitsch.*, 1908, 13, 348—353).—For estimation of lecithin, 100 c.c. of milk were precipitated with 200 c.c. of alcohol. The precipitate was extracted with chloroform in a Soxhlet apparatus. The alcoholic filtrate was evaporated at 50—60°, and the residue also extracted with chloroform. The two chloroform extracts were united, and the residue, after evaporating off the solvent, incinerated with fusion mixture. The amount of phosphoric acid in the ash was estimated, and from the results, the lecithin-content calculated. The amount of lecithin from several species of animals varied (as a mean of several analyses in each case) between 0.0109 and 0.0833%.

S. B. S.

Detection of Indican in Urine. ERNST SALKOWSKI (*Zeitsch. physiol. Chem.*, 1908, 57, 519—521).—The urine is mixed with copper sulphate solution and hydrochloric acid, and then chloroform added; the chloroform is coloured blue if indican is present. This method is described with full details, as to procedure and the precautions to be observed.

Gautier's statement that the urine of rabbits fed on cabbage does not contain indican is incorrect.

W. D. H.

The Guaiacum Reaction. CARL L. ALSBERG (*Arch. exp. Path. Pharm., Suppl.*, 1908, 39—53).—Various points in relation to this test for blood are discussed, and its unsatisfactory nature pointed out. The blood of many invertebrates gives the reaction, and particular attention has been paid to blood which contains hæmocyanin. This blood gives the test even after it is boiled. Hæmocyanin itself, other copper compounds, certain manganese compounds, and other salts give the test.

W. D. H.

Estimation of Catalases and Oxydases in Blood. I. WALTHER LOB (*Biochem. Zeitsch.*, 1908, 13, 339—347).—A preliminary account is given of the apparatus employed for the estimation of the amount of oxygen evolved when a hydrogen peroxide solution is treated with blood. The gas evolved was measured both by a "volume method"

and a "pressure method." In the former case, the vessel containing the peroxide was connected with a Hempel burette, and in the latter, with a manometer. The blood in both cases was contained in a small capsule resting on a plate which was fixed on to a ground stopper inserted into the side of the peroxide containing vessel above the level of the liquid. By turning the stopper through 180° , the capsule could be dropped into the peroxide solution. This was only done when the apparatus was in connexion with the burette or manometer, and had reached the constant temperature at which the experiment was carried out.

S. B. S.

Diazo-reaction of Atoxyl. ERCOLE COVELLI (*Chem. Zeit.*, 1908, 32, 1006).—Solutions of atoxyl give the following reactions: (1) with a hypochlorite, a yellow precipitate or coloration; (2) with a hypochlorite, phenol, and ammonia, a blue coloration, which can be observed even in a dilution of 1 : 100,000; (3) with reducing agents, such as zinc and sulphuric acid in the cold, or stannous chloride or hypophosphorous acid in hot hydrochloric acid, a yellow precipitate; and (4) with a fatty aldehyde and a hot mineral acid, a yellow coloration.

More delicate and characteristic reactions are given by arsenodiazobenzene, which is formed when atoxyl is treated with a few drops of a 1/2% solution of sodium nitrite and a few drops of sulphuric acid. The resulting solution gives: (a) with α -naphthylamine hydrochloride, a purplish-red coloration. This extremely delicate reaction is recommended for the detection of unchanged atoxyl, for example, in urine. Carbamide and the amino-acids, which react with nitrous acid, do not interfere with the test. The reaction may be employed also for the colorimetric estimation of atoxyl; (b) with a few drops of acet-aldehyde and potassium hydroxide, added drop by drop, a carmine-red coloration, changing to yellow, and finally becoming colourless. The carmine-red is stable in presence of an excess of alkali; and (3) with phenols, such as β -naphthol, abrastol, resorcinol, morphine, or dinine, a purplish-red coloration. Towards biliverdin and pathological urines, which give Ehrlich's diazo-reaction, arsenodiazobenzene behaves in the same manner as sulphodiazobenzene.

G. Y.

General and Physical Chemistry.

Refractive Indices of Solutions. FREDERICK H. GETMAN and F. B. WILSON (*Amer. Chem. J.*, 1908, 40, 468—484).—The specific refraction of various salts, acids, and non-electrolytes in water, calculated on the assumption that the refractive powers of solvent and solute are uninfluenced by the act of solution, have been compared with their specific refractions calculated from atomic refractions.

The lack of agreement in most of the cases studied is supposed to indicate the presence of hydrates in solution, but it has not been found possible to calculate the degree of hydration from the results.

R. J. C.

Refractometric Studies of some Methane Derivatives in which Two or Three Atoms of Hydrogen are Replaced by Negative Radicles. II. Sodium Salts. ALBIN HALLER and PAUL TH. MÜLLER (*Ann. Chim. Phys.*, 1908, [viii], 15, 289—296).—Mainly a résumé of work already published (*Abstr.*, 1905, i, 112); the difference between the values of M_D for free acid and sodium salt in the case of ethyl cyanoacetoacetate is 3.74; the acid therefore is a *pseudo-acid*. The possible constitutional formulæ of the sodium salts of the *pseudo-acids* are discussed.

M. A. W.

Atomic Decomposition and Spectral Series. AUGUST L. BERNOULLI (*Physikal. Zeitsch.*, 1908, 9, 745—749; *Ber. deut. physikal. Ges.*, 1908, 6, 636—642).—The author supposes that the molecules of a gas are not alike, but that the molecular and atomic weights represent average values. On the assumption that every chemical element in the gaseous condition represents a conglomeration of polymerised forms of a primordial matter in equilibrium, and that the gas mixtures obey Rayleigh's radiation law, a formula is deduced from which the atomic weights of the elements can be calculated. The formula is written

$$A = 1.0104 \left(\frac{-1 - \sqrt{3}}{2} \right)^p \cdot \left(\frac{-1 + \sqrt{3}}{2} \right)^q,$$

p and q being integral numbers. Using different values of p and q , atomic weight numbers in very good agreement with the experimental values are obtained.

Similar assumptions to the above have led the author to a formula which gives the lines and bands in the spectra of the elements with considerable accuracy.

H. M. D.

Flame Spectrum of Cupric Chloride. PETER KIEN (*Zeitsch. wiss. Photograph. Photophysik. Photochem.*, 1908, 6, 337—358).—The first part of the paper contains an historical review of previous investigations on the spectrum of cupric chloride; in the second, new experiments are described, the object of which was to determine the intensity and the structure of the bands.

The cupric chloride was introduced into the flame of a blow-pipe

fed with coal-gas and air, or oxygen, by means of a roll of filter paper moistened with a solution of the salt. By means of a spring and clockwork mechanism, the filter paper roll was moved up into the flame at a definite rate, and a steady supply of cupric chloride thereby obtained.

The intensity of the spectrum is not greatly influenced by the temperature, but depends very much on the amount of cupric chloride in the flame. As already pointed out by Lecoq de Boisbaudran, four stages of the spectrum, depending on the amount of salt in the flame, can be distinguished. The author's observations agree very well with those of Boisbaudran, except in the fourth stage, when an extremely small amount of salt is present; in these circumstances the only remaining band of any considerable strength reaches from $\lambda = 5100$ to $\lambda = 5800$, and has a maximum at $\lambda = 5400-5600$.

The four characteristic double bands which are seen in the second stage: α ($\lambda = 4259-4279$), β ($\lambda = 4333-4353$), λ ($4412-4433$), and δ ($4493-4515$), are found with great dispersion to consist of groups of bands in which series of lines can be recognised.

Attention is called to the sensitiveness of the cupric chloride spectrum. Photographic registration of the "sodium chloride" spectrum in coal or coke fires has confirmed Salet's conclusion that this is due to traces of cupric chloride.

H. M. D.

Spectrum of Neo-erbium Oxide and Kirchhoff's Law. KARL A. HOFMANN and GÜNTHER BUGGE (*Ber.*, 1908, 41, 3783-3789, Compare Hofmann and Burger, this vol., ii, 189).—The reflection spectrum of neo-erbium oxide illuminated by an electric arc light is far more characteristic than the absorption spectrum of a 10% solution of the nitrate, and, in agreement with Kirchhoff's law, it is found that the lines of maximum absorption in the former spectrum correspond with the bright lines in the emission spectrum of the oxide heated with a hydrogen flame. The bands of maximum absorption of the nitrate solution do not exactly correspond with the lines of the oxide spectrum, but are somewhat displaced; thus, the maxima of emission of the oxide are: $\lambda = 661.3, 653.0, 563.4, 540.2, 522.6, 493.0, 489.1, 463.0$, and 447.0 ; the maxima of absorption of the oxide are: $\lambda = 661.7, 652.4, 563.8, 540.4, 522.4, 491.5, 489.5, 462.5$, and 446.5 ; and of the nitrate solution, $\lambda = 667, 654, 541, 523, 519, 492, 487, 450$, and 442 . Both the oxalate and fluoride in a solid state give absorption spectra very similar in character to the absorption spectra of solutions of the nitrate and sulphate, although the intensities and positions of the bands vary slightly in each case. Sharp lines as well as bands appear in the absorption spectrum of the solid sulphate, so that a transition of the band spectrum of a salt to the line spectrum of the oxide appears probable.

W. H. G.

Spectroscopic Behaviour of Hydrocarbons with Conjugate Ethylene Linkings. JULIUS W. BRÜHL (*Ber.*, 1908, 41, 3712-3720, Compare Trans., 1907, 91, 115).—Reif's results (this vol., i, 847) confirm the author's previous conclusions. The values for the refractive dispersions Δ^{B^6} -hexenol and Δ^{B^6} -hexadiene have been re-determined and Reif's results confirmed.

In the latter compound, the values indicate exaltations of +1.49, +1.71, and +0.52 units in the values for $(n_a^2 - 1)/(n_a^2 + 2) \times P/d$, $(n_b^2 - 1)/(n_b^2 + 2) \times P/d$, and $M_\gamma - M_\alpha$ respectively.

Using the formula $(n^2 - 1)/n^2 + 2 \times P/d$, the following values have been calculated for $\Delta\gamma$ -hexatriene from W. H. Perkin's numbers:

H_α	D.	$M_\gamma - M_\alpha$
30.59	31.03	2.22

which indicate exaltations of 2.07, 2.49, and 1.01 units respectively. These results are striking when compared with the normal optical behaviour of benzene, $\Delta^{1,3,5}$ -cyclohexatriene, which shows practically no exaltation. Harries and Majima's $\Delta^{1,2}$ -dihydrocymene (this vol., i, 733) also exhibits characteristic exaltations, due to conjugated ethylene linkings.

It is pointed out that the intermediate product described by Auwers and Hessenland (this vol., i, 551) in the preparation of $\Delta^{1,3}$ -dihydro-*p*-xylene, and stated to be the corresponding acid, cannot have this constitution, as its methyl ester exhibits no exaltation, but is optically normal. It is suggested that the ethylene linkings in the acid are not in conjugate positions.

Zelinsky and Gorsky (this vol., i, 619) claim to have prepared dihydrobenzenes which give normal molecular refractions and dispersions, although they contain conjugated ethyl linkings. It is pointed out that these authors have not conclusively proved the constitution of their compounds by the examination of decomposition products. J. J. S.

Water of Crystallisation as Affected by Light. RALPH H. MCKEE and ELVIN J. BERKHEISER (*Amer. Chem. J.*, 1908, 40, 303—305).—Aniline-*p*-sulphonic acid has been found to lose its water of crystallisation more readily when exposed to light than when kept under exactly similar conditions in the dark. Careful observations showed that, although the temperature of the specimens exposed to direct sunlight was 2.86° lower than those screened from such light by black paper, yet the former lost more than 98% of their water of crystallisation during ten winter days' exposure, whilst the latter only lost 35% during the same period. From determinations of the solubility of the product, no evidence was obtained of any transformation having taken place into the ortho- or meta-compound. When hydrated sulph-anilic acid or the product obtained after exposure to sunlight was crystallised from water above 80°, it was found to be in an anhydrous state, whilst from water at 40° the crystals obtained had again 2H₂O. J. V. E.

Violet Coloration Produced in Glass by the Influence of Light. J. G. MASCHHAUPT (*Chem. Weekblad*, 1908, 5, 807—808).—The author attributes the violet colour sometimes developed in the glass of old mirrors to the action of sunlight, and describes experiments in support of his contention. A. J. W.

Some Reflections on Radiology. ALBERT REYCHLER (*Bull. Soc. chim.*, 1908, [iv], 3, 1009—1012).—Rutherford and Soddy's theory that radioactive substances consist of unstable, large accumulations of particles of a primordial matter, which are liable to internal

changes and decompositions, tending towards closer and more stable arrangements of the particles, does not in the author's view account for all the facts observed, and particularly for (a) the large amounts of energy disengaged and (b) the conversion of an atom of uranium into several atoms of helium (f) and one atom of radium, which is more voluminous and more active than that of the parent substance.

These difficulties disappear if the ether is taken as the primordial matter, and is regarded as existing in elementary atoms in two forms, namely, condensed, as nodules, an accumulation of which forms the atom, and also in the free state. If the intra-atomic transpositions may then be regarded as involving also the condensation of the free ether, the changes which occur can be represented thus: radium + ether = α -particles + β -particles + emanation. This view would explain the discrepancy between Ramsay and Rutherford's estimates of the length of "life" of a radium atom, that of the former being too short. It implies, however, that radioactive matter enclosed in a glass tube should gain in weight, since the ether would have free access and only β -rays could escape. The β -rays it is suggested, however, may be in part an inflow of electropositive ether.

Extraordinary Radioactivity of Water from a Spring at Valdemorillo. JOSÉ MUÑOZ DEL CASTILLO (*Anal. Fis. Quim.*, 1908, 6, 398—400).—Samples of water from a spring at Valdemorillo were found to have radioactivities varying from 27,000 to 51,687 volts per hour-litre. The latter value is remarkably high, and much exceeds that found with the waters from Lerez (10,000—12,000 volts per hour-litre: compare Abstr., 1907, ii, 218; this vol., ii, 750).

W. A. D.

Radioactivity of Three Springs at Oña (Burgos). JOSÉ MUÑOZ DEL CASTILLO (*Anal. Fis. Quim.*, 1908, 6, 400—402).—The following table shows the character of the rock through which the springs percolate, and the radioactivity of the water and mud therefrom in volts per hour-litre:

	Rock.	Activity of water.	Activity of mud.
Spring A	Argillaceous limestone.....	34.8	23.6
„ B	Cretaceous „	30.0	99.3
„ C	Argillaceous „	12.8	30.2

Spring B is one of considerable volume feeding the river Oca. All three springs come to the surface within a radius of 200 metres from one another. It is probable that all three springs arise from a common source; the difference between the values for the mud of B and that from A and C is probably due merely to the muds being of different consistency.

W. A. D.

Radioactivity of the Gases of the Thermal Spring of Uriage (Isère). GUSTAVE MASSOL (*Compt. rend.*, 1908, 147, 844—846).—During the passage of the water through a siphon to the reservoir, very variable quantities of gas are evolved; determina-

tions in two successive half-hours (when a considerable volume of water was flowing) gave 538 litres and 724 litres respectively. Of this gas, 7% is soluble in potassium hydroxide solution (carbon dioxide and hydrogen sulphide), whilst the remainder consists of nitrogen and allied gases. The radioactivity of the gas, as measured by a Curie electroscope (as modified by Chéneveau and Laborde), was 0.150 and 0.144 per 10 litres of gas (at 20° and 745 mm.), the radioactivity of the emanation per minute from 1 mg. of radium being taken as the unit. These results are not strictly comparable with Besson's (following abstract), since the latter refer to the gas dissolved in the water, of which 64.6% is insoluble in potassium hydroxide solution (Lefort found that 1 litre of the water of Uriage contains 3.2 c.c. CO_2 , 7.44 c.c. H_2S , and 19.5 c.c. N_2). For the radioactivity of the gas remaining dissolved in the water, the author obtains the value 0.500 per 10 litres. The saline residue left on evaporating the water, the deposit formed in the reservoir, and the rock from which the water flows are all quite inactive.

E. H.

Radioactivity of the Waters of Uriage-les-Bains (Isère). PAUL BESSON (*Compt. rend.*, 1908, 147, 848—850. Compare preceding abstract).—Three litres of the water were boiled for one hour, the gases evolved being collected over mercury and dried by means of potassium hydroxide and phosphoric acid. After keeping for three hours, the radioactivity of the gas was measured by means of the Chéneveau and Laborde modification of the Curie electroscope. For the gas from 10 litres of water, the values 0.012, 0.015, and 0.018 in mg.-minute units were obtained at pressures of 745 mm., 740 mm., and 735 mm. respectively. Thus the value seems to increase as the atmospheric pressure decreases. This observation of radioactivity in a mineral water containing 6.0567 grams of sodium chloride and 3.311 grams of calcium, magnesium, and sodium sulphates is in accordance with Kofler's work on the solubility of the emanation in saline solutions. The period of half-decay according to Curie's law is four days. The residue left on evaporation is inactive.

The ferruginous water has the very low radioactivity 0.003 mg.-minutes.

E. H.

Absorption of the Radioactive Emanations by Charcoal. R. W. BOYLE (*J. Physical Chem.*, 1908, 12, 484—506).—Experiments have been made to determine how the absorbing power of charcoal for the emanations of radium and thorium depends on the conditions.

The absorbing power of charcoal for radium emanation at the ordinary temperature is considerable, but the rate of absorption soon falls off, owing to saturation of the upper layer and the comparatively slow rate of diffusion to the lower layers.

The majority of the experiments were made with thorium emanation. As the rate of decay of the emanation is so great, the observations were made by leading the latter, mixed with air, through tubes containing various absorbing or non-absorbing materials, and estimating its activity by measuring the ionisation of air produced. The results are given in the form of tables and curves, the latter being

obtained by plotting the ionisation current against the speed of the air current.

The degree of absorption of the emanation depends : (1) on the speed of the air current, being diminished by increasing the speed ; (2) on the nature of the charcoal, being greatest for cocoanut, intermediate for animal, and least for wood, charcoal ; (3) on the extent of absorbing surface exposed, being greatest for the most finely-divided charcoal, and (4) is greater the lower the temperature.

G. S.

Action of the Radium Emanation on Water. ERNEST RUTHERFORD and T. ROYDS (*Phil. Mag.*, 1908, [vi], 16, 812—818. Compare Cameron and Ramsay, *Trans.*, 1908, 93, 992).—Preliminary experiments are described, the object of which was to ascertain the minimum amount of neon which can be detected spectroscopically. Small quantities of air were subjected to the action of cocoanut charcoal, cooled by liquid air, and the residual gas introduced into a small spectrum tube, 7 cm. long and 1 mm. in diameter, and examined for neon. Operating on 1/15 c.c. of air, the yellow line of neon is readily observed ; with 2/15 c.c. of air, the red lines of neon are clearly visible, and with 1/5 c.c. of air, a brilliant neon spectrum showing most of the lines is obtained. Since, according to Ramsay, one volume of neon is contained in about 100,000 volumes of air, these experiments show that less than one-millionth of a c.c. of neon can be detected spectroscopically.

The gases formed by the action on water of a quantity of emanation, corresponding with the equilibrium amount from 150 mg. of radium, were then examined in a similar manner, after the hydrogen and oxygen had been removed by explosion. A complete and brilliant spectrum of helium was found, but there was no trace of a neon spectrum. In all, five experiments were made ; neon was only observed in one case, and was found to be due to a small air leak. The gases obtained from the aqueous solution of the radium salt, from which the emanation had been pumped off, also showed no trace of neon when examined in the same way.

The positive results obtained by Cameron and Ramsay in similar experiments are attributed to the leakage of air into the apparatus used.

H. M. D.

Nature of the Positive Rays. WILHELM WIEN (*Sitzungsber. K. Akad. wiss., München*, 1908, 55—65).—Experiments are described the object of which was to find an explanation for the well-known fact that the canal rays are unequally deviated under the influence of a magnetic field. The results indicate that this lack of uniformity cannot be due to the ions having different masses, but is a consequence of differences in the lengths of the paths which they traverse in the charged condition. The nature of the canal rays is determined by a condition of equilibrium, in which the ratio of the charged to the uncharged particles has a constant value. Under the influence of a magnetic field, some of the charged particles are removed, but the condition corresponding with the equilibrium ratio is immediately restored by dissociation of the atoms.

H. M. D.

β -Rays of Actinium. OTTO HAHN and LISE MEITNER (*Physical. Zeitsch.*, 1908, 9, 697—702).—The β -rays emitted by actinium are not absorbed by aluminium according to an exponential formula. With gradually increasing thicknesses of aluminium, the absorption is at first more rapid than that required by such a formula; in the second stage, the absorption is exponential, whilst in the third, a more rapid rate of absorption is again found. It is found that the increase in the absorption in the third stage is dependent on the experimental arrangements.

The large value of the absorption coefficient for small thicknesses of the absorbing layer is found to be due to the emission of easily absorbed β -rays by radio-actinium. This was separated from the other products of disintegration, and its β -ray activity examined. In addition to β -rays, which are absorbed to the extent of 50% by 0.04 mm. of aluminium, it emits a much more penetrating type of radiation, which consists either of hard β -rays or soft γ -rays.

β -Rays are also emitted by actinium A and actinium C. The former are absorbed even more readily than the soft β -rays of radio-actinium; the latter are absorbed to the extent of 50% by 0.24 mm. of aluminium.

The view that homogeneous products emit homogeneous β -radiation is confirmed by the results of this investigation. H. M. D.

Influence of Pressure on Ionisation Produced in Gases by the X-Rays. The Saturation Current. E. ROTHÉ (*Compt. rend.*, 1908, 147, 785—788).—A method is described for studying the influence of pressure on ionisation phenomena in general, and details are given of the precautions necessary to secure regular working of the Crookes' tube. The author shows that the intensity of the saturation current is proportional to pressure from 0.1 to 5 atmospheres. W. O. W.

Volatilisation Produced by Canal Rays. JOHANNES STARK (*Zeitsch. Elektrochem.*, 1908, 14, 752—756).—The canal rays consist of charged or uncharged atoms or molecules projected with great velocity. When such particles strike a metal, they impart their velocity to one or more atoms of the metal, which may rebound with sufficient violence to pass away from the surface of the metal. The consequences of this idea are followed out, and the author thinks that the cathodic volatilisation of metals is better explained in this way than by Kohlshütter's chemical theory (this vol., ii, 457). T. E.

Electromotive Force of Iodine Concentration Cells in Water and Alcohol. ARTHUR P. LAURIE (*Proc. Roy. Soc. Edin.*, 1908, 28, 382—393; *Zeitsch. physikal. Chem.*, 1908, 64, 615—628).—Measurements are recorded of the *E.M.F.* of concentration cells consisting of platinum wires immersed in differently concentrated solutions of iodine in aqueous and alcoholic potassium iodide.

For aqueous solutions in which the iodine concentration is small, the observed values of the *E.M.F.* of the concentration cell are in good agreement with those calculated from Nernst's equation when

the free iodine concentrations are determined from the equilibrium constant corresponding with the dissociation equation: $KI_a \rightleftharpoons KI + I_2$. For more concentrated solutions, the observed values differ sensibly from those obtained by calculation.

Similar relationships between the two series of numbers are found in the case of alcoholic solutions, and the conclusion is drawn that Nernst's equation also applies to these solutions and that they contain potassium tri-iodide like the aqueous solutions.

Measurements in aqueous alcoholic solutions show that the *E.M.F.* of a given concentration cell increases as the proportion of alcohol in the mixture increases.

When solutions containing equal quantities of iodine and potassium iodide in water and alcohol respectively are opposed to one another, a considerable *E.M.F.* is obtained. The action of the cell involves the transference of iodine from the aqueous to the alcoholic solution, and the transference of potassium iodide in the reverse direction. In both cases the transference is towards the solvent in which the substances dissolve more readily.

H. M. D.

Explanation of Supertension. III and IV. FELIX KAUFER (*Zeitsch. Elektrochem.*, 1908, 14, 737—741, 749—752).—In consequence of Müller's criticism (this vol., ii, 802), the author has made measurements of the difference of potential between lead or smooth platinum cathodes and a solution of acetophenone or benzophenone in aqueous alcohol containing potassium acetate during electrolysis. These show that, under the same conditions, the fall of potential between the solution and the cathode is greater with lead than with platinum.

The resistance of a cell with a mercury cathode and an anode of platinum or of lead in which the electrolyte is sulphuric acid of maximum conductivity is measured during the passage of a current. With a low current density (under 0.05 ampere per sq. cm.) the attainment of a steady condition is extremely slow. The resistance of the cell is much larger than that observed with no current flowing; it is greatest with small current density, and is not dependent on the nature of the anode. Stirring the mercury does not change the resistance. As in the case of lead previously investigated (this vol., ii, 558), the author assumes the existence of a film of a hydride of high resistance on the surface of the mercury. The product of film resistance and current, which is the supertension due to the transition resistance at the surface of the cathode, is approximately independent of the current density and varies from 0.05 to 0.1 volt.

T. E.

Influence of the Velocity of Ionic Reactions on the Current-Potential Curve. ARNOLD EUCKEN (*Zeitsch. physikal. Chem.*, 1908, 64, 562—580).—The relation of current and potential has been studied in the double cyanides of potassium with silver, gold, copper, and mercury, but only the first of these allows of the production of a limiting current independent of the potential. The velocity of dissociation, $Ag(CN)_2 \rightarrow Ag + 2(CN)'$, is very great. The finite

velocity observed by Caspari (Abstr., 1900, ii, 7) is due to a secondary reaction. The smaller the velocity of the ionic reaction the smaller is the limiting current.

The velocity of dissociation of acetic, lactic, and benzoic acids has been calculated from the results of previous observers. C. H. D.

Ionisation Constants of the Secondary Hydrogen Ion of Dibasic Acids. RUDOLF WEGSCHEIDER (*Zeitsch. Elektrochem.*, 1908, 14, 740-741).—A claim of priority against Chandler (this vol., ii, 467). T. E.

Specific Charge of the Ions Emitted by Hot Substances. OWEN W. RICHARDSON (*Phil. Mag.*, 1908, [vi], 16, 740-767).—The ratio of the electric charge to the mass of the positive ions emitted by hot substances has been determined by measurements of the deflexion of the path, due to the action of a transverse magnetic field on the ions when moving in a uniform electric field.

The experimental data indicate that the ratio of the mass to that of the hydrogen atom is the same for the ions from carbon and platinum, and this is very nearly equal to the corresponding quantity determined by J. J. Thomson for the ions from iron. The values are respectively: for platinum, 25.7; for carbon, 27.6; and for iron, about 24.

These numbers show that the positive ions cannot be atoms of the metal or atoms of absorbed hydrogen; neither can they be regarded as identical with the positive electrons found by Thomson in the canal rays.

The emitted ions appear to be quite homogeneous, and experiments carried out between 750° and 1200° indicate that the ratio of charge to mass does not depend on the temperature of the hot substance in any simple way.

The mass ratios in terms of hydrogen are not very different from the molecular weights of nitrogen, carbon monoxide, and oxygen, but there is no evidence that the different substances evolve one or other of these gases when heated. The author, on the other hand, thinks it possible that the positive ionisation is due to a real constituent which is common to the different elements examined. In this case it is necessary to assume that the ions carry a charge which is smaller than the generally recognised fundamental electronic charge. H. M. D.

Determination of the Hydration of Ions by Transference. Experiments in the Presence of a Non-electrolyte. EDWARD W. WASHBURN (*Tech. Quart.*, 1908, 21, 288-320).—Experiments have been made to determine the transference of water which accompanies the migration of ions in aqueous solution by the measurement of transport numbers in presence of a third constituent, or reference substance, which remains stationary during the passage of the current. By referring the changes in concentration of the water and of the electrolyte to this third substance, the amounts of each transferred are calculated, and from these "true" transference numbers have been obtained.

Sucrose, raffinose, and arsenious acid were used as reference substances, the first two substances being estimated polarimetrically, the third by means of an iodine solution. The behaviour of arsenious acid is uncertain, on account of its ready oxidisability. A description of the transport apparatus has been previously given (this vol., ii, 805).

The experimental data show that the electrolysis of solutions of potassium, sodium, or lithium chloride containing one of the above reference substances is attended by an increase in the ratio of the quantity of non-electrolyte to that of water at the anode, and by a corresponding decrease at the cathode. It is shown that this is due chiefly, if not wholly, to a transfer of water from the anode to the cathode. From the measured changes, the relative degrees of hydration of the chlorine, lithium, sodium, and potassium ions have been calculated. On the assumption that the chlorine ion is not hydrated, the minimum hydration values of the cations have been calculated; these correspond with the formulæ: $K(H_2O)_{1.3}$, $Na(H_2O)_{2.9}$, and $Li(H_2O)_{4.7}$. From Buchböck's data for hydrochloric acid solutions, the minimum hydration value for the hydrogen ion corresponds with $H(H_2O)_{6.3}$. Absolute values for the hydration cannot be obtained until the hydration value of some one ion has been determined by some other method.

On account of this transference of water during electrolysis, the transport numbers hitherto obtained for more concentrated solutions of the alkali metal chlorides are erroneous. The true transference numbers are found to vary with the concentration much less than the apparent values obtained by the ordinary Hittorf method.

The true values are also given by the method of moving boundaries, and the author's data are found to agree very well with the results of Denison and Steele obtained by this method.

H. M. D.

Variation of the Degree of Dissociation of Certain Electrolytes with Temperature. ADOLFO CAMPETTI (*Atti R. Accad. Sci. Torino*, 1908, 43, 1071—1094).—The author has determined the conductivities, the temperature-coefficients of conductivity, and the degrees of dissociation of solutions of zinc and magnesium sulphates and of sulphuric acid for temperatures varying from 10° to 90° and for concentrations 3.0—0.001*N*.

The variation of the dissociation with the temperature is, as far as its sign is concerned, in agreement with van't Hoff's law. For an interval of concentration which is not too great, the degree of dissociation is best expressed as a function of the concentration by van't Hoff's formula: $K = \alpha^{3/2}c^{1/2}/(1 - \alpha)$, the expression given by Rudolphi, $K = \alpha^2c^{1/2}/(1 - \alpha)$,* yielding somewhat less concordant results.

Integration of van't Hoff's formula, $q = -RT^2/K \cdot dK/dT$, assuming that the heat of dissociation, q , per gram-molecule is constant for the temperature interval, $T_2 - T_1$, leads to the expression $q(T_1 - T_2)/T_1T_2 = 4.58[\log\{\alpha_2^2/(1 - \alpha_2)\} - \log\{\alpha_1^2/(1 - \alpha_1)\}]$, which is found

be approximately true with magnesium sulphate and with sulphuric acid.

In solutions of magnesium sulphate or zinc sulphate, the undissociated molecules give rise to complex molecules.

T. H. P.

Conductivity and Ionisation of Electrolytes in Aqueous Solutions as Conditioned by Temperature, Dilution, and Hydrolysis. HARRY C. JONES and C. A. JACOBSON (*Amer. Chem. J.*, 1908, 40, 355—410. Compare Abstr., 1905, ii, 794).—So many conflicting results have been published on the question of the influence of temperature on dissociation that the authors were induced to re-investigate the subject. The method employed was that previously described by Jones and West (Abstr., 1905, ii, 794), the temperature at which observations were made also being the same. Twenty-eight inorganic salts and six organic acids have been investigated; the molecular conductivity and percentage of dissociation at 0°, 10°, 25°, and 35° at eight dilutions are tabulated, also the temperature-coefficients in each case. The results are in agreement with the well established facts that (1) the molecular conductivity of electrolytes increases with rise of temperature; (2) the conductivity increases with increase in dilution up to a certain maximum value; (3) dissociation increases with increase in dilution up to the point of complete dissociation. At the somewhat low temperatures of these observations, no maximum in the conductivity curve, as described by Sack, Kohlrausch, and Noyes, was observed. Further, it was found that the conductivity of water increases as a linear function of the temperature, but the molecular conductivity of electrolytes in aqueous solution increases as a parabolic function of the temperature from 0° to 35°. The increase in conductivity of electrolytes causing the departure from a straight line is largely due to their being more or less hydrated; the rise in temperature diminishes the extent of this hydration, allowing the ions to move with less friction, and thus show an increase of conductivity. In support of this view, those salts which are strongly hydrated in solution are found to exhibit a greater increase in conductivity with rise of temperature than the salts that are slightly hydrated. The conclusion is also drawn from the results given that nearly all, if not all, electrolytes are hydrolysed in dilute solutions, and this greatly influences the true dissociation value. When the temperature-coefficients expressed as conductivity units are examined, they are all found to increase as the dilution increases, and for every salt they increase with rise of temperature; but the organic acids, on the other hand, have decreasing temperature-coefficients with increase of temperature. J. V. E.

Basicity of Acids as Determined by their Conductivities. M. R. SCHMIDT (*Amer. Chem. J.*, 1908, 40, 305—313).—After considering the work of Miolati and Mascetti (Abstr., 1901, ii, 381) on the effect of alkalis on the conductivity of solutions of various acids, and the anomalous behaviour of hydrogen fluoride solutions in this connexion (Pellini and Pegoraro, Abstr., 1907, ii, 860), the author gives his results of a study of the conductivity change when potassium

hydroxide is added to moderately strong solutions of phosphoric acid. Working with 0.2*N*, 0.1*N*, 0.04*N*, and 0.02*N* solutions of phosphoric acid, it was found that in the case of 0.2*N* solutions, the minimum occurs when only about 40% of the amount of potassium hydroxide required for one-third neutralisation had been added. In the more dilute solutions, the minimum shifts continually towards the point corresponding with the salt KH_2PO_4 , reaching it with 0.02*N* solutions. As a possible explanation of this, it is suggested that, as more and more potassium hydroxide is added, the H^+ ions of the phosphoric acid are replaced by K^+ ions, which move more slowly, and, as a result, the conductivity of the mixture decreases. But phosphoric acid being far from completely dissociated in strong solutions, when a small quantity of base is added, practically all the hydrogen ions present are neutralised. Immediately, however, more dissociate, and in sufficient quantity to overbalance the decrease in conductivity caused by the substitution of K^+ ions for the H^+ ions, thus causing the conductivity to rise again.

A minimum thus appears before enough alkali has been added to form the primary salt. Furthermore, as the dilution increases, the phosphoric acid becomes more and more completely dissociated according to the formulation $\text{H}_3\text{PO}_4 \rightleftharpoons \text{H}^+ + (\text{H}_2\text{PO}_4)^-$, thus lessening the overbalancing effect of secondary dissociation previously mentioned.

J. V. E.

Comparative Investigations on the Formation of Salts and the Basicity of Acids. GIUSEPPE BRUNI (*Zeitsch. Elektrochem.* 1908, **14**, 729—734).—The molecular conductivity of an acid of which a fraction x is neutralised is $\Lambda = x(l_a + l_s) + (1-x)\alpha(l_a + l_s)$, where l_a , l_s , and l_h are the mobilities of the metallic ion, the anion, and the hydrogen ion respectively, and α is the fraction of the acid which is dissociated. The salt is supposed to be completely dissociated. Assuming that the acid follows Ostwald's dilution law, α can be expressed in terms of known quantities. This gives an expression for the conductivity which reproduces all the peculiarities of the curves obtained by the author (this vol., ii, 935).

T. E.

Certain Phenomena in Gases Subjected to the Action of Spark Discharge or Arc Light. HEINRICH RAUSCH VON TRAUBENBERG (*Physikal. Zeitsch.*, 1908, **9**, 713—726).—Measurements have been made of the electrical conductivity of certain gases during, and after, the passage of electricity through them in the form of a spark discharge and of direct and alternating current arcs. The gases examined were hydrogen, oxygen, acetylene, carbon dioxide, air, coal gas, and carburetted hydrogen. The high conductivity, which is observed during the period of the spark or arc discharge in all cases, persists for several hours after the discharge is stopped in the case of acetylene and coal gas. The phenomenon was investigated more closely in the case of coal gas, and found to depend on the material of the electrodes, and on the nature of the discharge. In

some cases the conductivity, which is unipolar in nature, was found to decrease slowly, whilst in others it increased. No evidence of a saturation current could be obtained. The last part of the paper is devoted to a theoretical discussion of the possible modes of electrical transport through the conducting gases.

H. M. D.

Hysteresis of Certain Iron Compounds. G. BERNDT (*Physikal. Zeitsch.*, 1908, 9, 750—752; *Ber. deut. physikal. Ges.*, 1908, 6, 662—666*).—The magnetic properties of ferric oxide, ferric hydroxide (impure), ferric chloride, and ferrous and ferric sulphates have been examined. The oxide and hydroxide exhibit well-developed hysteresis; in the case of the salts, no such effect could be detected. As the strength of the field increases, the magnetic susceptibility of the oxide diminishes considerably, and that of the hydroxide slightly.

H. M. D.

Magnetic Properties of the Oxygenated Metallic Radicles. P. PASCAL (*Compt. rend.*, 1908, 147, 742—744. Compare this vol., ii, 756, 927).—By measuring the magnetic susceptibilities of their solutions, the author has obtained the following values for the molecular magnetic susceptibilities at 23°: of manganese sulphate, $+1500 \times 10^{-5}$; potassium permanganate, $+25.5 \times 10^{-5}$; chrome alum, $+2 \times 629 \times 10^{-5}$; chromic acid, -0.5×10^{-5} ; vanadium chloride, $+139 \times 10^{-5}$; sodium metavanadate, -30.2×10^{-5} . Comparison of each pair of salts shows that oxidation of the metal results in a diminution in the magnetic susceptibility; the molybdates and ferrates also, unlike the salts of molybdenum and iron, are diamagnetic.

The values for vanadium compounds: VCl_3 , $+139 \times 10^{-5}$; $(\text{V}_2\text{O}_5)\text{SO}_4$, $+2 \times 115 \times 10^{-5}$; vanadium tetrachloride (hydrolysed) ($= \text{V}_2\text{O}_5$), $+66.2 \times 10^{-5}$, and NaVO_3 , -30.2×10^{-5} , indicate that the magnetic properties of the vanadium ion diminish in proportion to the increase in the degree of oxidation; similarly, $\text{U}(\text{SO}_4)_2$ has $+320 \times 10^{-5}$, and $\text{UO}_3(\text{SO}_4)$, -5.57×10^{-5} .

These examples indicate the increasing generality of the law previously enunciated, that when the chemical properties of a metal become masked by its entry into a complex ion or colloid, the magnetic properties are similarly affected and to the same degree. An interesting example of this is afforded by vanadic anhydride, which dissolves in concentrated sulphuric acid to a red solution. The latter on dilution becomes first yellow and then colourless. The anhydride in the red solution has the molecular magnetic susceptibility $-2 \times 85.7 \times 10^{-5}$; in the yellow solution, $-2 \times 31.5 \times 10^{-5}$, and in the colourless solution, $-2 \times 30.2 \times 10^{-5}$. From these values, it is permissible to conclude that the strongly acid solutions contain red sulphovanadic compounds which dissociate on dilution. These complexes doubtless include Berzelius' vanadyl sulphate, $\text{VO}_2(\text{SO}_4)_3$, Ditte's compound, $\text{V}_2\text{O}_5 \cdot 3\text{H}_2\text{SO}_4$, and Gerland's salt, $4\text{SO}_3 \cdot \text{V}_2\text{O}_5 \cdot \text{K}_2\text{O}$.

E. H.

Measurements with Gas Thermometer. ARTHUR L. DAY and J. K. CLEMENT (*Amer. J. Sci.*, 1908, 26, 405—463).—The

* and *Ann. Physik*, 1908, [iv], 27, 712—734.

authors have endeavoured to improve the accuracy of the nitrogen in platinum standard gas thermometer between 0° and 1200° .

Particular attention was paid to uniformly heating the bulb by a series of independently regulated platinum coils whilst the unheated space between bulb and manometer was reduced to a minimum.

The whole furnace being contained in a bomb in which nitrogen was maintained at the same pressure as the thermometer, diffusion and strain on the bulb were obviated, so that much higher gas pressures could be employed than hitherto. The coefficient of expansion of the metal of the bulb was determined with great care.

The melting points of the purest commercially obtainable metals are given as follows: zinc, $418.5^{\circ} \pm 0.1$; silver, $958.3^{\circ} \pm 0.5$; gold, $1059.3^{\circ} \pm 1.0$; copper, $1081.0^{\circ} \pm 0.5$. Exact analyses of the metals are given, but different samples of ostensibly the same metal sometimes differed by 1° in melting point. It is claimed that the determinations of temperature are accurate to within half a degree. R. J. C.

Heat of Fusion, Specific Cohesion, and Molecular Weight at the Melting Point. PAUL WALDEN (*Zeitsch. Elektrochem.*, 1908, 14, 713—724).—For non-associated substances, the ratio L/a^2 is roughly a constant and equal to 3.6 (L = heat of fusion, and a^2 the height to which the liquid rises in a capillary of 1 mm. radius at the melting temperature). The expressions ML/T and Ma^2/T (M = molecular weight, and T absolute melting point) are also roughly constant for non-associated substances. The value of the former is 13.5, and that of the latter, 3.65. For associated substances, the degree of association may be obtained by dividing the value of the expression for any substance into the above constants. The results are in harmony with values obtained by other methods. By combining these results with Trouton's rule and van't Hoff's equations for the depression of freezing point and elevation of boiling point of solutions, it is shown that $E_1/E = 0.64T_1/T$ and $L/L_1 = 0.64T/T_1$, where E_1 , T_1 , and L_1 are the molecular elevation of boiling point, the absolute boiling point, and the heat of evaporation of a liquid, E , T , and L being the corresponding quantities at the freezing point. The application of the equations to some metallic and non-metallic elements and fused salts gives values for the degree of association which agree with what is known on other grounds about the size of their molecules. T. E.

Electrical Heating in Ebullioscopic Determinations and in Fractional Distillation. ERNST BECKMANN (*Zeitsch. physikal. Chem.*, 1908, 64, 506—507. Compare this vol., ii, 663; also Richards and Mathews, this vol., ii, 828).—When, in spite of electrical heating, superheating and bumping occur in ebullioscopic determinations, the difficulty can be got over by passing a current of an indifferent gas through the liquid.

An apparatus is sketched in which electrical heating has been successfully employed for the fractional separation of the chlorides of sulphur. In this way the chloride SCl_2 has been distilled off almost pure at -24° under a pressure of 4 mm. J. C. P.

Quartz Protecting Tubes in Thermal Analysis. P. SCHORN (*Metallurgie*, 1908, 5, 635—637).—Quartz tubes are to be preferred to porcelain for the protection of thermo-couples in the determination of freezing points of alloys, on account of their greater cheapness, and of the less resistance to the passage of heat. They are also less permeable than porcelain to metallic vapours. They are, however, more readily attacked by oxides. They can be used up to nearly 1500°, at which temperature they soften.

C. H. D.

Cryoscopic Investigations on Solutions of Gases in Liquids. PIETRO FALCIOLA (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 324—330).—The author has extended the investigations of Garelli and Falcicola (*Abstr.*, 1904, ii, 312) to the gases, carbon monoxide, nitrogen, hydrogen, oxygen, methane, and nitrous oxide, and to other solvents than those previously employed.

With water or formic acid, carbon monoxide produces a depression of the freezing point, whilst with acetic acid, benzene, and a number of other organic solvents, the freezing point is raised. Similar elevation of the freezing point of certain solvents is also produced by nitrogen, hydrogen, oxygen, and methane, but is not observed with carbon dioxide, hydrogen sulphide, acetylene, or nitrous oxide.

Benzene, the freezing point of which has been raised by means of carbon monoxide, assumes its normal freezing point gradually in the cold, but rapidly on heating. Bromoform, however, through which carbon monoxide or nitrogen has been passed, maintains its elevated freezing point for some days if kept in the dark and out of contact of the air. The phenomenon does not appear to be due to chemical action, but is probably caused by part of the gas adhering to the solvent and separating with the latter in the solid state.

The following table gives the coefficients of absorption of the various gases, calculated from the equation $c = m\Delta/k$.

	H ₂ .	O ₂ .	N ₂ .	CO.	CH ₄ .	N ₂ O.

T. H. P.

An Electrically Heated Oven, with a Liquid Regulator. L. EHLMANN (*Bull. Assoc. chim. Sver. Dist.*, 1908, 26, 272—274).—The apparatus described was constructed for the purpose of maintaining a moderately low temperature in an oven. An ordinary electric lamp is used as the source of heat, and the temperature is regulated by means of a tall cylindrical vessel containing very dilute sulphuric acid. A glass tube carrying a platinum wire is inserted through a cork in a tubulure at the bottom of the cylinder, and a long glass tube carrying a second platinum wire is passed through a cork at the top of the cylinder. This upper tube is made to move freely through the cork, so that the distance between the upper and lower platinum wires may be adjusted as desired. The cylinder is inserted in the circuit feeding

the lamp, and by altering the distance between the platinum wires the degree of heat obtained from the lamp may be regulated as desired. A second form of regulator is also described. It consists of a glass vessel containing the acidified water, and in the latter are placed two copper plates, one fixed and the other movable, the method of using this regulator being similar to that mentioned above. In both cases, means are provided for changing the direction of the current from time to time in order to prevent polarisation. W. P. S.

Thermodynamics of Salts containing Water of Crystallisation. HERMANN SCHOTTKY (*Zeitsch. physikal. Chem.*, 1908, 64, 415—448).—The author applies Nernst's theory (Abstr., 1907, ii, 153) to the case of formation of a higher hydrate from a lower one and water, and deduces from it the relationship $Q - A = T(C - C')$, where Q and A are referred to the combination of 1 molecule of water, C is the molecular specific heat of ice, and C' is the heat capacity of the combined molecule of water of crystallisation. For the purpose of testing this formula, the values of Q and $C - C'$ are obtained from thermochemical data, and A is calculated from the tension of the vapour over the hydrates.

The four cases selected for examination are: (1) $\text{CuSO}_4 + \text{H}_2\text{O} = \text{CuSO}_4 \cdot \text{H}_2\text{O}$; (2) $\text{K}_4\text{FeCy}_6 + 3\text{H}_2\text{O} = \text{K}_4\text{FeCy}_6 \cdot 3\text{H}_2\text{O}$; (3) $\text{BaCl}_2 + \text{H}_2\text{O} = \text{BaCl}_2 \cdot \text{H}_2\text{O}$, and (4) $\text{BaCl}_2 \cdot \text{H}_2\text{O} + \text{H}_2\text{O} = \text{BaCl}_2 \cdot 2\text{H}_2\text{O}$.

In order to supplement the few data already available in these cases, the author has determined (1) the specific heats of the hydrates; (2) the heats of hydration; (3) the dissociation pressures. The values obtained differ in some cases from those recorded by earlier investigators, and are employed to show that the formula $Q - A = T(C - C')$ is qualitatively correct in all four cases, and that for (1) and (3) it is capable of quantitative verification within the limits of experimental error. In the other two cases, the quantitative validity of the formula is only approximate.

The difficulty of determining the dissociation pressures of salt hydrates is discussed, and various forms of apparatus suitable for the determination are described. The sluggishness with which the maximum tension is reached is connected with the character of the efflorescing surface.

The theoretical and experimental work of Johnston (this vol., ii, 358) are adversely criticised. J. C. P.

Thermochemical Equivalence, and the Thermochemistry of Nitrogen. JOHN C. THOMLINSON (*Chem. News*, 1908, 98, 226. Compare Abstr., 1907, ii, 153).—In the belief that the numbers given previously may actually represent the thermal changes taking place, the author calculates from the structural formula he gives for nitrogen pentoxide and nitric acid an approximate heat of formation of 12,504 cal. and 45,447 cal. respectively. The experimental values are 13,000 cal. and 41,600 cal. J. V. E.

Apparent Deviations from Mariotte's Law and their Influence on the Measurement of Small Pressures. KARL SCHEEL and WILHELM HEUSE (*Physikal. Zeitsch.*, 1908, 9, 784—789; *Ber. deut. physikal. Ges.*, 1908, 6, 785—793).—The discrepancies

between the results of previous measurements of the compressibility of gases at low pressures have led the authors to examine the influence of a variation in the ratio of the exposed surface to the volume of the containing vessel in the case of air. In order to obtain a very large surface one of the containing vessels was filled with about 20 grams of glass wool. For a variation in pressure from 0.07 to 0.7 mm. of mercury, p_v remained constant in the absence of the glass wool, but when this was present, p_v was found to diminish as the pressure was increased. After drying the glass wool by exhausting the apparatus, and leaving in contact for some time with phosphoric oxide, the variation in p_v could no longer be observed.

The authors conclude that the deviations from Boyle's law which Baly and Ramsay found when air was compressed at low pressures in capillary tubes are due to the presence of a film of condensed water on the surface of the glass containing vessels; when this is removed, the apparent deviations disappear, and the same results are obtained whether the gas is compressed in vessels with a small or with a large amount of exposed surface.

It is pointed out that when the McLeod gauge is used for the measurement of small pressures, all traces of water vapour must be removed from the gas and from the walls of the glass vessel.

H. M. D.

Viscosity and Fluidity. EUGENE C. BINGHAM (*Amer. Chem. J.*, 1908, 40, 277—280. Compare Abstr., 1906, ii, 218).—It is found with pure liquids that the fluidities of unassociated substances are approximately a linear function of the temperature, the relation being expressed by the formula $t_1 = A\phi + K_1$, where t is the temperature absolute, ϕ the fluidity, and A and K_1 are constants. Associated compounds, however, especially the alcohols, depart widely from the linear type, except at high temperatures, when the fluidity curves approximate to a straight line. To represent the increase in temperature required to give the fluidity ϕ on account of the association of the substance, use is made of the expression $t_2 = K_2 - B/\phi$, where B and K are constants. Added together, these two equations become $t = t_1 + t_2 = A\phi - B/\phi + C$, which, when tested with Thorpe and Rodger's data (*Trans.*, 1897, 71, 374) for substances not highly associated, gives results in closer agreement with observed facts than does Slotte's equation. With associated substances, such as acids, alcohols, and water, fairly close agreement is also observed. An approximate equation containing four constants, $t = A\phi - B/(\phi + D) + C$, is also used; it gives with associated substances results in as close agreement with observed values as does the above simpler equation with unassociated substances. Tables comparing the values for hexane and water, calculated by the various equations, are given.

J. V. E.

Anomalies in the Viscosity of Emulsions and of Anisotropic Liquids. EMIL BOSE (*Physikal. Zeitsch.*, 1908, 9, 707—708).—The changes observed in the viscosity of anisaldazine in the neighbourhood of the clearing point (this vol., ii, 258) cannot be used as a proof against the emulsion theory of anisotropic liquids. On the other

hand, Vorländer's experiments (this vol., i, 641) indicate that this theory is untenable.

H. M. D.

Influence of Electrolytes on the Viscosity of Colloidal Liquids. MANFREDI ALBANESE (*Arch. exp. Path. Pharm., Suppl.*, 1908, 16—28).—The viscosity of an aqueous solution of gum arabic is lowered (up to 30%) by the addition of electrolytes, but not by other substances. Solutions of certain other colloids, such as egg-albumin, are not affected by electrolytes, unless they have been dialysed previously, in which case the viscosity is somewhat diminished by adding salt.

G. B.

Capillary Properties of Aqueous Solutions of Fatty Acids. BOHDAN VON SZYSZKOWSKI (*Zeitsch. physikal. Chem.*, 1908, 64, 385—414. Compare this vol., ii, 827).—In contrast with the usually accepted view, the author finds that the heights to which water and fatty acid solutions rise in capillary tubes are almost independent of accidental impurities. For the purest water obtainable, for ordinary distilled water, for conductivity water, and for tap-water, the observed capillary rise is the same to within 0.1 mm. It is also found unnecessary to take special precautions in protecting the capillary tubes from dust; washing out with chromic acid mixture is quite adequate preliminary treatment.

The acids specially examined were *n*- and *iso*-butyric acids, *n*- and *iso*-valeric acids, and *n*- and *iso*-hexoic acids, and the experiments show that the higher an acid stands in the homologous series the greater is its effect in lowering the capillarity of water; the effects of the *n*- and *iso*-acids are nearly equal. In the case of *isobutyric* acid, the variation in the capillarity with concentration is satisfactorily reproduced by the empirical formula $y = 1 - b \log(x/a + 1)$, where *a* and *b* are constants, *x* is the concentration, and *y* is the capillary rise referred to that of water as standard. The other acids examined obey this dilution law only approximately.

In most cases there are considerable differences between the author's measurements and those recorded by Drucker (*Abstr.*, 1905, ii, 680); this is probably to be attributed to the different purity of the acids employed.

Some experiments made on the relative influence of *isovaleric* acid and its barium salt, and on the effect produced by mixtures of the two, support the view that the depression of the capillarity of water is to be attributed to the undissociated part of the acid.

Experiments made with mixtures (1) of *isobutyric* and *isovaleric* acids, and (2) of *isobutyric* and *isohexoic* acids, indicate that the depression of the capillarity of water is an additive property for the fatty acids. In the first case, this fact may be made the basis of an analytical determination of the mixed acids.

J. C. P.

Osmotic Pressure. JOHANNES J. VAN LAAR (*Zeitsch. physikal. Chem.*, 1908, 64, 629—632).—The formula for the osmotic pressure of a perfect solution proposed by Lewis (this vol., ii, 465) is identical with that obtained by the author (*Abstr.*, 1895, ii, 107; 1906, ii,

526) on thermodynamic grounds. The formula obtained in this way is valid for imperfect, as well as for perfect, solutions, and is in accordance with the experimental results of Morse and Frazer (Abstr., 1905, ii, 475; 1906, ii, 600, 601).

C. H. D.

The Vapour Pressure and Osmotic Pressure of a Volatile Solute. HUGH L. CALLENDAR (*Proc. Roy. Soc.*, 1908, A, 81, 336).—If an osmotic membrane is impermeable to the solute, the formulae for the change of vapour pressure with hydrostatic pressure, and for osmotic pressure, are the same for a volatile as for a non-volatile solute. If, on the other hand, the membrane is permeable to the vapour, but not to the liquid phase, the equation depends on the concentration of the constituents in the vapour phase.

C. H. D.

Osmotic Pressure of Sucrose Solutions at 15°. HARMON N. MORSE and B. MEARS (*Amer. Chem. J.*, 1908, 40, 194—213. Compare Abstr., this vol., ii, 671).—In order to ascertain the cause of the osmotic pressure of sucrose solutions at 0° not being in agreement with the gas pressure, as at 20°, measurements at intermediate temperatures have been made. The authors now give results of measurements made at 15°, and from a comparison with those obtained at 0°, 5°, and 10°, previously recorded (*loc. cit.*), they are able to state that sucrose solutions exhibit a temperature-coefficient which is practically identical with the temperature-coefficient of gases.

J. V. E.

Electric Osmosis. JOSEPH C. W. FRAZER and HARMON N. HOLMES (*Amer. Chem. J.*, 1908, 40, 319—325).—A description is given of the apparatus used, and also the results of a preliminary investigation of the relative osmosis of a few salts of nitric acid at the concentration 0.001*N*. The observations recorded for nine different salts appear to support the statement made previously (Abstr., 1906, ii, 600) that the osmosis of the nitrates of alkalis and alkaline earths varies inversely as the velocity of the cation divided by its valency, but the osmosis does not seem to be proportional to the specific resistance of the solutions.

It is suggested that some connexion may exist between this phenomenon and the results obtained by Kohlrausch (Abstr., 1903, ii, 403) and others working on the hydration of ions.

J. V. E.

Improvement in Cells for the Measurement of Osmotic Pressure. HARMON N. MORSE and B. MEARS (*Amer. Chem. J.*, 1908, 40, 266—277).—A detailed account is given of the weak points of the cell previously used and described (Abstr., 1905, ii, 575); the paper deals, however, in general with the form of cells and the method of closing them for the measurement of osmotic pressure. A new form of cell is described, which is entirely free from the objectionable features of the older one. The upper end of it is glazed inside and out, and has an accurately ground conical aperture at the top for the reception of a brass, cone-shaped collar, which is covered with a caoutchouc cap carrying the manometer

tube. The closing of this cell is rapidly effected by screwing a brass nut down on to the collar. For details of construction and manipulation, the original must be consulted. J. V. E.

Improved Manometers for Measurement of Osmotic Pressure. HARMON N. MORSE and B. F. LOVELACE (*Amer. Chem. J.*, 1908, 40, 325—337).—An apparatus is described by means of which manometers may be compared with others, or with the standard, up to pressures of three hundred atmospheres. Corrections for meniscus, and a method of detecting a temporary or a permanent stretch of the manometer, are also given, as well as a detailed description of the method used by the authors for filling and closing their manometers. J. V. E.

The System Water, and Sodium, Barium, and Copper Chlorides. FRANS A. H. SCHREINEMAKERS and W. C. DE BAAT (*Chem. Weekblad*, 1908, 5, 801—806).—The authors represent the quaternary system water, sodium chloride, barium chloride, and copper chloride by means of a regular tetrahedron, the four angles giving the four components. The method is an extension of that employed to represent a ternary system by means of an equilateral triangle. A. J. W.

Velocity of Reactions in Gases Moving through Heated Vessels, and the Effect of Convection and Diffusion. IRVING LANGMUIR (*J. Amer. Chem. Soc.*, 1908, 30, 1742—1754).—In studying the changes which take place in mixtures of gases while passing through hot tubes, the velocity coefficient of the reaction is usually calculated by means of the formula derived for reactions occurring in stationary gases. Bodenstein and Wolgast (this vol., ii, 162) have pointed out that this method is inaccurate, since allowance is not made for the mixing of the gases in the tube by diffusion or convection, and they have presented a formula which holds when the mixing of the gases can be considered complete.

In the present paper, these two formulæ and the magnitude of the error arising from their application in various cases are considered. New formulæ are developed, from which the velocity coefficient may be calculated in cases in which neither of the formulæ mentioned holds good, but in which, in the mixing of gases, diffusion plays a more important part than convection. E. G.

Relation between the Velocity of Reaction and the Velocity of Stirring in Non-homogeneous Systems. K. JABŁCZYŃSKI (*Bull. Acad. Sci. Cracow*, 1908, 620—631).—The rate of dissolution of a solid in a liquid increases with stirring. The connexion between the velocity constant k and the velocity of the stirrer n is given by the empirical equation $k_1/k_2 = (n_1/n_2)^x$, where x is a constant, the value of which varies with different apparatus, and even with the same apparatus if taken apart and put together again. This probably accounts for the different values of x obtained by different investigators (Bruner and Tolloczko, *Abstr.*, 1903, ii, 470; Bruner, *Abstr.*, 1904, ii, 315; Sackur,

Abstr., 1906, ii, 261). The evaluation of α is important, since it gives some information as to how far a reaction in a non-homogeneous system is dependent on diffusion (Noyes and Whitney, Abstr., 1897, ii, 479; Nernst, Abstr., 1904, ii, 315). In the same apparatus, so arranged that each experiment can be completed without any disturbance of the parts of the apparatus, the author has examined, at 25°, the solution of a marble plate in hydrochloric acid, the decomposition of hydrogen peroxide by platinised platinum foil, and the solution of a fused zinc plate in hydrochloric acid. The average values of α are 0.93, 0.55, and 0.28 respectively. Hence the author deduces that, for the dissolution of a solid with a perfectly smooth surface, the velocity constant of the reaction is simply proportional to the velocity of stirring (as measured by the revolutions of the stirrer); if the surface of the solid is not smooth, the increase of the velocity constant is slower than the increase of the velocity of stirring, and the more so the rougher the surface.

C. S.

Saponification of Glycerides during Ester Exchanges in Homogeneous Systems. ROBERT KHEMANN (*J. pr. Chem.*, 1908, [ii], 78, 364—367); MILAN J. STRITAR and RICHARD FANTO (*ibid.*, 408). —Polemical (compare Abstr., 1907, i, 464; this vol., i, 120, 499; ii, 677).

G. Y.

Oxidations of Biological Importance. I. HANS EULER and IVAN BOLIN (*Zeitsch. physiol. Chem.*, 1908, 57, 80—98).—Careful experiments have been made on the oxidation of quinol by oxygen in the presence of manganous salts and alkali. It is shown that the velocity of the reaction is almost proportional to the pressure of the oxygen, and that the temperature-coefficient is very small between 0° and 40°. The solutions used were either neutral or slightly acid to phenolphthalein. To obtain such solutions, it is necessary to add dilute alkali, as quinol is decidedly acidic. The effect of the manganese (added as acetate) and of the sodium concentrations has been studied. As the whole reaction cannot be represented by means of the usual unimolecular formula, owing to the fact that part of the quinol is removed in the form of insoluble quinhedrone, the velocity has been determined by measuring the times required in the different experiments for absorbing a given volume (3 or 5 c.c.) of oxygen. The results show that in neutral or slightly acid solutions, manganese salts accelerate the oxidation, and that if the amount of sodium hydroxide added is the same, the rate of oxidation increases less rapidly than the manganese concentration. On the other hand, if the amount of manganese salt is constant, the velocity increases much more rapidly than the amount of alkali added.

The relationship between the effects of the manganese salt and the alkali is compared with that of an enzyme and co-enzyme.

Similar experiments have been made with "laccase" and manganese salts. It is shown that the laccase as prepared by Bertrand's method is slightly acid, and that it has no action on a quinol solution in the absence of manganese salts. It is obvious that the action of the laccase cannot be due to its alkaline nature, as suggested by Dony-

Hénault. Even the addition of 10 c.c. of 0.0001*N* hydrochloric acid to lucerne laccase does not affect the activity of the laccase in the presence of manganous salts.

It is further shown that the active principle of the laccase is not a substance of the enzyme type, as the preparations of laccase can be boiled for three minutes without destroying their activity in the least.

It is shown that salts of hydroxy-acids, for example, rochelle salt, sodium citrate, calcium gluconate, and sodium mucate, accelerate the oxidation of quinol in a marked manner when manganese salts are present, and it is suggested that laccase owes its activity to the presence of such salts.

J. J. S.

Some Oxydasic Phenomena Produced by Colloidal Ferrous Ferrocyanide. JULES WOLFF (*Compt. rend.*, 1908, 147, 745—747. Compare this vol., i, 137, 490; ii, 573).—In a feebly alkaline solution, colloidal ferrous ferrocyanide acts as an oxydase towards quinol. When a saturated solution of quinol is treated with ammonia to the extent of 1 part in 25,000, and colloidal ferrocyanide to the extent of 1 part of iron in 100,000, abundant crystals of quinhydrone are formed after twelve to fifteen minutes, oxidation being accelerated by shaking. The reaction is still observed with one-twenty-fifth as much iron if the quantity of alkali is increased to 1 part in 2000. Solutions of quinol treated with alkali alone become brown, but rarely deposit crystals, the colloidal iron alone has no action. If too much alkali (1%) is added, the solution is rapidly oxidised by the air, and no crystals are formed. These phenomena can be explained by the alkali facilitating the oxidation of the phenol, and consequently the action of the ferrocyanide, which thus acts as an oxydase. This view is supported by the facts that if the alkali is added some time before the colloidal iron, quinhydrone is no longer obtained, and that, other things being equal, the intensity of the reaction is proportional to the amount of alkali present (within the limits described above). From the latter observation, it would be expected that the alkali-earth oxides and hydrogen carbonates, and feebly alkaline salts, such as disodium hydrogen phosphate, would exercise a much less energetic action. This is actually found to be the case. The important part played by the alkali suggests that the oxidising action on quinol of certain manganese salts with weak acids discovered by Bertrand (*Abstr.*, 1897, ii, 493) is due partly to their alkalinity, all of them being alkaline to methyl-orange. The author finds that the addition to these solutions of a quantity of iron in the form of colloidal ferrocyanide, one-hundredth as great as that of manganese present, suffices to double the rate of oxidation of quinol, and that neutral aqueous manganese sulphate solutions, which are ordinarily almost inactive, increase their activity considerably when treated with traces of pyridine (which does not precipitate manganese).

E. H.

Catalysis. ~~See~~ Catalytic Reactions induced by Enzymes. SALOMON F. ACREE (*Amer. Chem. Soc.*, 1908, 30, 1755—1760).—Attention is drawn to the work of Hudson (this vol., i, 605, 856)

on the inversion of sucrose by invertase, and it is shown that it harmonises completely with the view already advanced by others, that the addition of an enzyme to a reacting system brings about a catalytic reaction, owing to the union of the enzyme with some constituent or "substratum" of the reacting system to form a new product which gives the same end-products as the substratum itself. It is pointed out that this theory of catalysis through the formation of reactive intermediate compounds renders the assumption of a vital energy for such reactions unnecessary.

E. G.

Molecular State of Molten Salts. RICHARD LORENZ and FELIX KAUFLEDER [in part, A. LIEBMANN] (*Ber.*, 1908, 41, 3727—3738).—The molecular weights of lead chloride, potassium nitrate, sodium nitrate, and silver chloride in the fused state at various temperatures between 300° and 600° have been determined by measuring the surface tension of the molten salt. The mean values of K obtained for potassium nitrate and sodium nitrate, namely, 0.7 and 0.25 respectively, are in fair agreement with those recorded by Bottomley (*Trans.*, 1903, 83, 1421). The constants found for silver chloride and lead chloride were respectively 0.8 and 0.9. Since these values are all less than 2.12, the constant for liquids having a normal mol.-wt., the conclusion is drawn that the salts investigated exist in the fused state in a highly associated condition and that the ions are of a complex nature.

W. H. G.

Liquid Crystals. OTTO LEHMANN (*Ber.*, 1908, 41, 3774—3783).—Mainly a historical review of the author's investigations on the subject of liquid crystals.

The view recently put forward by Vorländer (this vol., i, 641), that pseudo-isotropic, crystalline liquids are to be regarded as uniaxial crystals, is combated. It is possible for a biaxial mass to become pseudo-isotropic, that is, apparently uniaxial.

W. H. G.

The Liquid-crystalline State as a General Property of Matter. P. P. VON WEIMARN (*Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 166—168*).—Having shown in previous papers (this vol., ii, 90, 263) that the colloidal-amorphous state of matter is a modification of the crystalline, the author has now studied certain liquid crystals, such as *p*-azoxyphenetole, both microscopically and ultramicroscopically, and states his views of the nature of these crystals as follows. A liquid crystal is a system of chemically or physically associated, solid, crystalline particles, between which vectorial forces of small tension act. The small magnitude of the tension in the case of chemical association is conditioned by the considerable energy expended in building up the complicated molecule in the case of physical association by the expenditure of energy requisite for the association of a number of elementary crystalline particles to one particle.

G. S.

Theory of Colloids. EDUARD JORDIS (*Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 153—166).—A summary of the author's views on the nature of colloidal solutions (compare *Abstr.*, 1907, ii, 344; this vol., ii, 675).

* and *J. Russ. Phys. Chem. Soc.*, 1908, 40, 1323—1327.

The theory developed is in many respects identical with that of Duclaux (summarised in *J. Chim. Phys.*, 1907, 5, 29), and many of Duclaux's results are discussed in detail. Pure hydrosols are not stable; the stability is determined by small amounts of other substances, usually electrolytes, which act as "sol-formers." These substances are in chemical combination with the dissolved colloids, and when they are completely removed, the hydrosol coagulates.

G. S.

Electrical Nature of Colloidal Solutions. NICOLA PAPPADÀ (*Gazzetta*, 1908, 38, ii, 474—480. Compare Abstr., 1907, ii, 754).—The author criticises Duclaux's hypothesis concerning the electrical nature of colloids (compare Abstr., 1904, ii, 162, 243, 325; 1905, ii, 432, 511; 1906, ii, 660, 677; this vol., ii, 760).

T. H. P.

Influence of Colloids on the Absorption of Gases, especially of Carbon Dioxide in Water. ALEXANDER FINDLAY [with W. H. HARRY] (*Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 169—170).—The absorption of carbon dioxide by blood is not well understood, and it is suggested, in agreement with Wolfgang Ostwald (this vol., ii, 509), that, besides ordinary chemical combination, adsorption on the surface of the colloidal particles may be of importance in this connexion. As the first step in an investigation of the effect of colloids on the solubility of gases, the solubility of carbon dioxide in colloidal solutions of ferric hydroxide, gelatin, arsenic sulphide, silicic acid, albumin, dextrin, soluble starch, and glycogen has been measured at 25°. The first two colloids increase the solubility, the three last mentioned diminish it somewhat, and the other three are without effect.

G. S.

Colloidal Silver (Silver-gel) in Photographic Layers. LÜPP-CHRAMER (*Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 170—174).—For the direct production of positives as employed in ferrotype photography, it is necessary that the silver in the parts which are most strongly lighted should be obtained in a more or less white form. This can now be effected with dry collodion plates covered with colloidal substances, such as tannin or gum.

In order to study the deposition of silver in different forms, silver bromide plates have been exposed in a Chapman Jones "plate tester," which allows of graduated illumination. When a plate thus exposed is developed with ferrous oxalate, the silver varies in appearance from greyish-white, on the most highly exposed parts, to greyish-black, on the parts almost in shade, and the difference persists after fixing. The white silver has a much smaller adsorptive power than the black form, and this difference in properties is employed to account for certain phenomena occurring in photographic processes.

G. S.

Freezing of Hydrosols. O. BOBERTAG, KARL FEIST, and H. W. FISCHER (*Ber.*, 1908, 41, 3675—3679).—The paper gives a review of the behaviour of colloidal solutions at temperatures below the freezing point of the solvent. By rapid cooling to -70° , the metal is separated

from Bredig's colloidal suspension of platinum. By freezing a colloidal solution of arsenic trisulphide, Winter (Abstr., 1905, ii, 245) obtained the solid red modification, the authors cool a very dilute solution to -70° , and, after thawing, recover the yellow colloidal solution, which, however, has become very turbid. Colloidal ferric hydroxide, cooled to -70° and thawed, remains clear, but shows a distinct augmentation of the Tyndall phenomenon. Aluminium acetate behaves somewhat similarly. The colloidal silver preparations, protargol, collargol, and lysargin, in the presence of albumin are dark coloured, very turbid, and optically non-homogeneous; by freezing, the silver collects into small lumps, which are distributed irregularly through the clear ice; on thawing, the solution is recovered apparently unchanged.

In connexion with organic colloids, certain dyes and substances of animal and vegetable origin have been examined. Rhodamine, chrysoidine, eosin, and safranine form true solutions; Nile-blue, acid-violet, methyl-violet, and magenta behave as semi-colloids, and night-blue, alkali-blue, Congo-red, and benzopurpurin as pronounced colloids (compare Freundlich and Neumann, this vol., ii, 820; Höber and Chassin, *ibid.*, ii, 875).

On cooling a 10% solution of tannin, a considerable deposition is observed just above the freezing point; on thawing the frozen mass, the tannin partly dissolves, the remainder going into solution by slight warming. Hæmoglobin (Merck), after being cooled to -10° , -70° , and -180° , shows no apparent change. Solutions of gum or starch, cooled to the same temperatures and thawed, are quite turbid, but clarify by keeping. Dried albumin in solution, cooled to -70° to -180° and thawed, gives a turbid solution, which does not again clarify entirely. Solutions of gelatin, caragheen moss, agar-agar, and soap behave in a similar manner on freezing. The water is mostly frozen out from the jelly, so that the first portion of the liquid obtained by thawing is practically free from dissolved substances. After complete thawing, the product is decidedly non-homogeneous, consisting of a mobile liquid and a clotted jelly.

Attempting to explain the varying behaviour of the preceding colloidal solutions on freezing, the authors suggest that the freezing causes the colloidal particles to become aggregated, and that these aggregations may be partly or entirely destroyed by thawing, with the result that a precipitation or a solution is obtained.

C. S.

Study of Colouring Matters in Solution. LOUIS PELET-JOLIVET and A. WILD (*Compt. rend.*, 1908, 147, 683—685; *Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 174—177; *Bull. Soc. chim.*, 1908, [iv], 3, 1087—1094).—From a study of the electrical conductivity and the ultramicroscopic state of solutions of various dyes (magenta, methylene-blue, crystal-violet, safranine, crystal-ponceau, naphthol-yellow S, Congo-red, etc.), the conclusion is drawn that dyes are dissociated in aqueous solution into two ions, and that some of them assume the colloidal condition. Addition of electrolytes favours the passage into the colloidal state. The authors' results do not entirely agree with those of Teague and Buxton (Abstr., 1907, ii, 933) and of Freundlich and Neumann (this vol., ii, 820).

J. C. C.

Fixation of Different Derivatives of the Same Colouring Matter and Explanation of Dyeing. LOUIS PELET-JOLIVET and N. ANDERSEN (*Compt. rend.*, 1908, 147, 808—810.* Compare preceding abstract).—Wool was placed in solutions containing equivalent quantities of derivatives of certain basic and acidic colouring matters. Other conditions being the same, the hydrochloride of safranine gave a paler tint than the sulphate, and the phosphate a darker tint. The hydroxide gave a tint intermediate between the sulphate and phosphate. The sodium salt of crystal-ponceau produced lighter tints than the magnesium salt; the aluminium salt gave darker tints, whilst the free acid was intermediate between the two latter salts in colouring power.

These experiments confirm the theory of Freundlich and Loser (*Abstr.*, 1907, ii, 155, 534) of the fixation of basic and acidic dyes. The wool is supposed to become negatively charged when placed in water; when treated with a solution of the salt of a basic dye, adsorption of the positively charged organic ion occurs, whilst in the case of the salt of an acidic dye, the positive inorganic ion is adsorbed, causing the fabric to assume a positive charge, which, being smaller than the negative charge produced by an equivalent quantity of a negative dye, accounts for the well-known fact that wool and charcoal fix basic dyes more readily than acidic ones. This accords, moreover, with the effects produced by adding electrolytes to the bath, since positive multivalent ions or hydrogen ions should favour the fixation of the acidic dyes, whilst negative ions should hinder the process. A rational explanation is thus afforded of the action of mordants and of the tanning process.

W. O. W.

Passive State of Metals. Review of the Literature and Theories and Some Experiments on Cobalt, Iron, and Nickel. HORACE G. BYERS (*J. Amer. Chem. Soc.*, 1908, 30, 1718—1742).—A historical and theoretical discussion is given of the work done hitherto on the passivity of metals. Experiments are described which have been carried out with cobalt, iron, and nickel. A plate of the metal connected with a copper conducting wire was suspended as anode in a porous cup, which was placed in a porcelain beaker. Both beaker and cup were nearly filled with solutions of the various electrolytes. The cathodes, two platinum plates of the same size as the anode, were suspended in the beaker parallel to, and at equal distances from, the anode. The amount of the anode dissolved during the passage of the current was measured by its loss of weight.

The results obtained were so varied and conflicting as to render a brief summary impossible. Iron, nickel, and cobalt cannot be rendered passive by the hydrogen acids or their salts. Passivity may take place in electrolytes containing oxygen, and depends on the current density, the temperature, the electrolyte, and the treatment of the metal. The metals may be either passive or active under exactly the same current conditions so long as the current density is below a critical value.

The phenomena of passivity have not yet received any satisfactory explanation. Faraday's view, connecting passivity with the formation of a coating of oxide on the metal, is untenable. The hypotheses of

* and *Zeitsch. Chem. Ind. Kolloide*, 1908, 3, 206—210.

Finkelstein and Müller, according to which the passive state is occasioned by changes in the valency of the metal, are unsatisfactory. Many of the results now obtained cannot be reconciled with Fredenhagen's explanation, which attributes passivity to anodic oxygen or an oxygen alloy.

E. G.

Determination of the Atomic Weight of the Simple Ponderable Substance, Pantogen. GUSTAVE D. HINRICHS (*Compt. rend.*, 1908, 147, 797—800. Compare this vol., ii, 573, 574).—The author assumes the existence of a simple fundamental material of atomic weight $1/128$, and thence proceeds to theoretical deductions as to the weight and geometrical forms of the atoms of hydrogen, helium, nitrogen, oxygen, and fluorine. The paper includes a diagrammatic representation of the atoms of these elements, and of their physical properties in the neighbourhood of the absolute zero.

H. O. W.

Atomic Weight of Radium and Other Elementary Substances. HENRY WILDE (*Phil. Mag.*, 1908, [vi], 16, 824—830. Compare Abstr., 1907, ii, 149; this vol., ii, 141).—The author still maintains that the true atomic weight of radium is 184. A periodic table is given, based on the numerical relationships previously described.

H. M. D.

New Form of Test-tube Holder. H. STOLTZENBERG (*Zeitsch. angew. Chem.*, 1908, 21, 2272).—The advantage of the new form of wire holder described lies in the fact that, not only may the tube or other object held be readily released, but the force by which it is held may be increased by the power of the hand. It thus becomes possible to lift fairly heavy vessels and to shake them without fear of their falling.

J. V. E.

Apparatus for Evaporating in a Dish under Reduced Pressure. EDUARD DONATH (*Chem. Zeit.*, 1908, 32, 1107).—The accompanying figure depicts the apparatus described by the author. It consists of two parts, A and B, both being made of stout copper having thick, broad flanges so as to form an air-tight chamber when they are screwed down on to an asbestos washer by screws, g. Into the lower part, A, the evaporating basin, f, is placed upon asbestos fibre.

The upper part, B, is perforated in three places, c, d, and e; c is covered by a thick plate of transparent mica, the liquid to be evaporated is introduced through d, and e is connected to an exhaust pump.

J. V. E.

Circulating Pump. H. STOLTZENBERG (*Zeitsch. angew. Chem.*, 1908, 21, 2271—2272).—A new form of small centrifugal pump is described as being an efficient circulator of liquid from a thermostat through condensers, jacketed polarimeter tubes, etc. The power required to drive the pump is very small, and when rotating at 1200 revolutions per min. it is able to lift water to a height of ten metres.

J. V. E.

Inorganic Chemistry.

[Production of Hydrogen Peroxide from Persulphuric Acid.] CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE (D.R.P. 199958).—When carefully-purified solutions of persulphuric acid are treated with sulphuric acid (D 1.4) at 50—80°, the former rapidly yields hydrogen peroxide with a loss of only 3 or 5% of oxygen. This result is, however, only obtained in the absence of all impurities likely to decompose hydrogen peroxide catalytically (compare *Trans.*, 1904, 85, 1526—1533).

G. T. M.

Generation of Oxygen in a Kipp's Apparatus. LUDWIG WOLTER (*Chem. Zeit.*, 1908, 32, 1066).—The extremely vigorous evolution of oxygen from alkali peroxides when treated with water or dilute acids has been sufficiently modified by admixture with indifferent substances to allow of the generation of the gas in a Kipp's or other gas generation apparatus by this method.

The best results have been obtained with a substance prepared by adding a mixture of 100 parts of sodium peroxide and 25 parts of magnesium oxide to 100 parts of molten potassium nitrate. This, when solidified and broken into pieces of a suitable size, is placed in a Kipp's apparatus and treated with dilute hydrogen chloride. The substance may be kept for some time ready for use by dipping the lumps into molten paraffin wax so as to protect them from the atmosphere.

J. V. E.

Dynamic Allotropy of Sulphur. I. HUGO R. KRUYT (*Zeitsch. physikal. Chem.*, 1908, 64, 513—561).—The investigations of Smith and his collaborators (*Abstr.*, 1903, ii, 139, 284; 1905, ii, 382, 580; 1906, ii, 157; 1907, ii, 20; this vol., ii, 32) have led to results which accord best with the theory that S_A and S_μ are partly miscible in the liquid state, but that the equilibrium curve lies entirely outside the heterogeneous region. Smith's conclusion, that the equilibrium curve cuts the curve of miscibility, is untenable. A bibliography and review of previous literature on the subject are given.

The melting point of rhombic sulphur was determined by immersing capillary tubes containing the powdered sulphur in boiling calcium chloride baths at different temperatures, and was finally fixed at

112.4°. Similar sulphur, heated for an hour at 90° in ammonia to produce equilibrium, melted at 110.9°. The unstable "natural melting point" of rhombic sulphur was then found graphically to be 110.5°, and the melting point of pure rhombic sulphur 112.8°. From 111° onwards, the melting-point curve must be parallel to the concentration axis.

The composition of the vapour in contact with liquid sulphur at different temperatures was measured by blowing a current of air through the molten sulphur at constant temperature, and condensing the current of vapour on the surface of water at 0°. Ammonia gas was introduced as a catalyst, this being subsequently removed by the current of air, the sulphur dioxide formed by partial oxidation then serving to preserve the composition of the vapour unchanged during cooling. The condensed sulphur was analysed by extraction with carbon disulphide. The vapour and liquid curves intersect at 324° and 24.7% S_μ .

The vapour-pressure curve of the system S_λ — S_μ presents either a maximum or a minimum, but it is not yet possible to determine which. This point is to be further investigated. This curve must cut the curve of equilibrium.

C. H. D.

The Boiling Point of Sulphur on the Constant Pressure Air Thermometer. NICHOLAS EUMORFOPOULOS (*Proc. Roy. Soc.*, 1908, *A*, 81, 339—362).—A detailed account of measurements with a Callendar air thermometer of Jena glass. The various sources of experimental error were very fully investigated, the most important being the changes of volume of the glass bulbs. The mean value of the boiling point of sulphur obtained is 443.58°. C. H. D.

The Boiling Point of Sulphur. HUGH L. CALLENDAR (*Proc. Roy. Soc.*, 1908, *A*, 81, 363—366. Compare preceding abstract).—The changes of volume in glass render it an unsuitable material for accurate thermometry. The value for the boiling point of sulphur obtained by Eumorfopoulos is in close agreement with those obtained by other methods, the chief source of error being now the uncertainty as to the true coefficient of expansion of mercury. C. H. D.

Preparation of Hydrazine. FRITZ RASCHIG (D.R.-P. 198307).—When excess of strong aqueous ammonia reacts with a solution of sodium hypochlorite in the presence of an organic substance to increase the viscosity of the solution, a good yield of hydrazine is obtained. One litre of sodium hypochlorite and 12 c.c. of a solution containing 5% of joiners' glue are added to 3 litres of concentrated aqueous ammonia, the solution heated to drive off ammonia, and concentrated to the crystallising point, when 80—90 grams of hydrazine sulphate are obtained on the addition of sulphuric acid. The product is purified by crystallisation. G. T. M.

Hydroxylamine. I. ERICH EBLER and E. SCHOTT (*J. pr. Chem.*, 1908, [ii], 78, 289—342).—The authors review the various formulæ

which have been proposed for hydroxylamine, and assemble the evidence in favour of the view that it is a tautomeric substance, having in alkaline solution the constitution $\text{NH}_2\cdot\text{OH}$, and acting as an acid, but in acid solution behaving as an oxonium base, NH_3^+O , forming salts of the type $\text{NH}_3^+\text{O} \begin{smallmatrix} \text{H} \\ \diagup \\ \text{X} \end{smallmatrix}$. This view of the nature of hydroxylamine is applied to the explanation of its properties and of the reactions which it undergoes.

Anhydrous hydroxylamine is readily prepared by dissolving 4–5 grams of the 75% distillate obtained by Uhlenhuth's method (Abstr., 1900, ii, 475) in 100–400 c.c. of absolute alcohol, and cooling the solution to about -18° . Hydroxylamine is deposited from the stronger solutions in white leaflets, and from the more dilute solutions slowly in needles.

Lobry de Bruyn found (Abstr., 1892, 1391) that hydroxylamine reacts with zinc, forming zinc oxide and ammonia. It is now shown that the intermediate product of this reaction is a zinc salt, $\text{Zn}(\text{O}\cdot\text{NH}_2)_2$, and not an additive compound, $\text{Zn}\cdot\text{O}\cdot\text{NH}_2$. A similar calcium salt has been prepared, and indications obtained of the existence of an extremely unstable ferric salt. It is proposed to apply the term hydroxylamites to the salts $\text{NH}_2\cdot\text{OM}'$, $(\text{NH}_2\cdot\text{O})_2\text{M}'$, etc.

Calcium hydroxylamite, $\text{Ca}(\text{O}\cdot\text{NH}_2)_2$, is formed with evolution of gas when calcium filings are treated with anhydrous hydroxylamine at 50° . Ammonia is evolved only if heat is developed, which takes place if water is present. The white salt, which separates towards the end of the reaction, is extremely explosive, being much more dangerous than anhydrous hydroxylamine; when washed with absolute alcohol and dried in a vacuum over sulphuric acid, it is obtained as a white, amorphous powder, which detonates at 180° , and is hydrolysed by water, slowly by moist air, forming calcium hydroxide and hydroxylamine. It is considered that Hofmann and Kohlshütter's calcium salt of hydroxylamine (Abstr., 1898, ii, 380) is a mixture of calcium hydroxylamite and calcium hydroxide.

Zinc hydroxylamite, $\text{Zn}(\text{O}\cdot\text{NH}_2)_2\cdot 3\text{NH}_3\text{O}$, prepared by the action of anhydrous hydroxylamine on finely-divided pure zinc and treatment of the product with absolute alcohol, is obtained in glistening crystals, loses hydroxylamine, and leaves a residue of zinc oxide when gradually heated, detonates, evolving ammonia, when quickly heated, and is readily hydrolysed by moisture, forming zinc hydroxide.

Haber observed (Abstr., 1898, ii, 23) that hydroxylamine oxidises ferrous salts in ammoniacal or sodium carbonate solution, and stated that the hydroxylamine is itself converted into ammonia. It is now found that under these conditions nitrogen and nitrous oxide are first evolved, ammonia appearing only towards the end of the reaction. The study of the reaction is complicated by the fact that hydroxylamine is decomposed catalytically by ferric hydroxide in neutral or alkaline solution, yielding the same three products. The ferric hydroxide residue is scarlet, becomes brownish-red when heated, does not decolorise permanganate or evolve chlorine from hydrochloric acid, and thus resembles the ferric hydroxide residue obtained from the catalytic

decomposition of hydrogen peroxide. If hydroxylamine is treated with ferric hydroxide in absolute alcoholic solution at about -18° , a brown precipitate is formed, which, after being washed with absolute alcohol, decomposes on treatment with water, forming nitrogen, nitrous oxide, and ammonia, and must therefore contain *ferric hydroxylamite*.

Hydroxylamine silicofluoride, $(\text{NH}_3\text{O})_2\text{H}_2\text{SiF}_6 \cdot 2\text{H}_2\text{O}$, prepared by adding 16% aqueous hydrofluosilicic acid to a 25% aqueous solution of hydroxylamine and allowing the mixture to evaporate, crystallises from boiling methyl alcohol in scales, and is almost insoluble in alcohol, but readily dissolves in water.

Hydroxylamine titanofluoride, $(\text{NH}_3\text{O})_2\text{H}_2\text{TiF}_6$, prepared by adding 20% hydroxylamine to a cooled solution of hydrofluotitanic acid and evaporating the solution in a vacuum, separates from methyl alcohol in white crystals. With quadrivalent titanium, hydroxylamine gives the same yellow coloration, caused by the formation of a higher oxide of titanium, as is produced by hydrogen peroxide.

G. Y.

The Interaction of Nitrous Gases and Oxygen with Water.
FRITZ FOKKSTER and M. KOCH (*Zeitsch. angew. Chem.*, 1908, 21, 2209—2219. Compare this vol., ii, 941).—In continuation of this investigation (*loc. cit.*), the authors have studied the behaviour towards water of nitric peroxide when greatly diluted with air. The results, which are tabulated, show the proportion of nitric peroxide converted into nitric acid to be greater when the concentration of this gas in the gaseous mixture is greater; it is, however, not directly proportional, being considerably less than would be expected. This may be explained by the fact that with large excess of air the nitrous acid represented in the equation $\text{H}_2\text{O} + 2\text{NO}_2 \rightleftharpoons \text{HNO}_3 + \text{HNO}_2$, being less stable in solution, allows of a more rapid absorption of fresh nitric peroxide than when the excess of air is less. It is also shown that with diluted nitric oxide the increased concentration of nitric acid is not due simply to absorption of more oxides of nitrogen, but, in part, to the nitric acid formed previously leaving the solution with water as $\text{HNO}_3 \cdot \text{H}_2\text{O}$. The limiting concentration at the ordinary temperature at which this takes place is indicated by the following: with 1% NO_2 , about 46% HNO_3 ; with 2% NO_2 , about 51.8% HNO_3 , and with 5% NO_2 , more than 55.6%.

From a study of the influence of a large excess of air on the behaviour of the nitrous acid produced in the primary change, it is shown that it completely decomposes, with time, into nitric acid and nitric oxide. Excess of oxygen, when not at the same time under a smaller partial pressure, rapidly oxidises this nitric oxide to nitric peroxide, but, in the case of a large excess of air, there is insufficient time for the nitric oxide that is carried forward from the water solution to be completely oxidised to the peroxide. The quantity of nitric oxide escaping oxidation was ascertained by substituting for the water, dilute alkali hydroxide solution as absorbent, and the quantity of nitrite produced is shown to be greater when the dilution by air is greater.

Nitric peroxide, even when largely diluted by air, is rapidly

oxidised by ozone to nitrogen pentoxide, and when such a gaseous mixture is passed into water, or aqueous nitric acid, an acid solution containing more than 80% HNO_3 may readily be obtained.

J. V. E.

Formation of Colloidal Phosphorus. ALFRED LOTTERMOSER (*J. pr. Chem.*, 1908, [ii], 78, 367—368).—When exposed to diffused daylight in a closed vessel, a clear, colourless solution of white phosphorus in contact with solid white phosphorus gradually becomes opalescent and orange-yellow by reflected, but clear and yellowish-red by transmitted, light. The hydrosol thus formed is unstable, and, after some time, deposits a scarlet crust of red phosphorus on the glass walls of the vessel. The formation of the hydrosol must result from the conversion, under the influence of the diffused light, of the dissolved white phosphorus into the red modification, which is almost insoluble in ether, and separates, therefore, at first in the colloidal form. The strong yellow colour of the hydrosol supplies further evidence that the light red colour of the red phosphorus depends on the finely-divided state of the latter. So soon as red phosphorus is deposited on the walls of the vessel, the solution is free from the hydrosol, partly because the colloid is completely precipitated and partly because the deposit protects the remaining white phosphorus from the action of light.

G. Y.

Ionisation by Phosphorus and Phosphorescence. LÉON BLOCH and EUGÈNE BLOCH (*Compt. rend.*, 1908, 147, 842—844).—It has been shown previously (Abstr., 1905, ii, 72) that the air which has passed over phosphorus is the seat of a true ionisation, and the ions produced have a small mobility. It is now found that when an air current of greater velocity is employed, the phosphorescence becomes elongated in the direction of the current, and with a further increase in the velocity, definitely separates itself from the phosphorus with the production of a dark space. The phosphorus generally retains a slight phosphorescence, but this disappears finally when the velocity is sufficiently augmented. If the tube is sufficiently long, the phosphorescence which assumes the form of a phosphorescent column can be removed several metres from the phosphorus by regulating the air-current. A condenser placed in or beyond, but not before, the phosphorescence becomes charged, whilst an iodide-starch paper (test for ozone) becomes blue in the positions in which the condenser is charged. It is thus shown that the phosphorescence, ionisation, and ozone are produced in the same region, and therefore that the three phenomena are produced, not by the oxidation of the phosphorus itself, but of some substance emanating from it. This might be either phosphorus vapour or phosphorous oxide. From the results obtained by Jungfleisch (Abstr., 1905, ii, 244) and by Schenk, Mihr, and Bantien (Abstr., 1906, ii, 326), the latter supposition seems the more probable. This view is also supported by the observation of the authors, that if the dark space is cut suddenly, phosphorescent bubbles are formed, which travel slowly in opposite directions, disappearing either on collision or, more rarely, of their own accord.

If the dark space contains phosphorous oxide, which is spontaneously inflammable, this phenomenon is explained, the movement of the luminous bubbles being the propagation of explosive waves.

The transformation of phosphorus into phosphoric oxide is a vivid combustion, and it is therefore to be expected that the ions produced would be of the same nature as in other cases of combustion. The analogy between the large ions of phosphorus and those of the gases of flames has been pointed out by Bloch and by Harms (Abstr., 1904, ii, 331), who finds an increase in the mobilities as the phosphorus is approached. The latter result is confirmed by the authors, who obtain values up to 0.1 mm. close to the phosphorus. The mobilities can, however, be greatly increased (up to 2–3 mm.) by inserting a cotton plug beyond the phosphorus to retain the fumes formed on the latter. It seems, therefore, that the phosphorus ions are produced by the combustion of the phosphorous oxide, and rapidly rendered heavy by the presence of liquid or solid particles. E. H.

Sublimation of Arsenic. W. P. A. JONKER (*Chem. Weekblad*, 1908, 5, 783–785).—The sublimation point of arsenic determined by the aid of a thermopile is 616°/760 mm. A. J. W.

The Luminosity of the Bunsen Flame. BURRITT S. LACY (*Zeitsch. physikal. Chem.*, 1908, 64, 633–640. Compare Haber and Richardt, Abstr., 1904, ii, 166).—In order to study the cause of the luminosity in the inner zone, the author has introduced methane into a separated Bunsen flame, 5 mm. above the summit of the inner cone, without producing any effect on the luminosity. Special experiments were made to eliminate the cooling effect of the current of methane. The results are in accordance with Haber and Richardt's view, that the production of the light is a luminescence phenomenon. The presence of methane in the middle zone of the separated flame was confirmed.

The constant $k = [\text{H}_2\text{O}][\text{CO}]/[\text{CO}_2][\text{H}_2]$ was found to be the same whether the gases were taken from a zone just above the green cone or from a higher zone at a temperature 300° lower, being about 3.7. A catalytic influence of the platinum tube used was, however, observed.

C. H. D.

Precipitated Silica. HENRY LE CHATELIER (*Compt. rend.*, 1908, 147, 660–662).—The existence of hydrates of silica is questioned on account of the variable amounts of water revealed by analysis. When gelatinous silica, purified from electrolytes by diffusion, was heated in a sealed tube at 320° for six hours, no change in appearance or consistency could be detected. The author draws the conclusion that silica, like chromium trioxide, does not form hydrates, but on account of its absolute insolubility remains in an extremely fine state of division when precipitated. Freshly-precipitated gelatinous silica in distilled water may be used to polish hard substances, such as bronze.

R. J. C.

Products of the Arc and Spark Electric Discharge in Liquid Argon. FRANZ FISCHER and GEORGE ILIOVICI (*Ber.*, 1908, 41, 3802—3810).—If compounds of argon are capable of existence, they are probably endothermic, and might be produced at a high temperature and afterwards be preserved by sudden cooling, as in the formation of ozone in liquid oxygen (compare *Abstr.*, 1907, ii, 163, 340). Cadmium was used for the electrodes, and with the spark discharge, after three hours in liquid argon, 3.3 mg. of an olive-green substance, and with the arc after 140 minutes, 22.7 mg. of a black substance, were obtained. These, on examination, proved to contain cadmium nitride, but mixed with cadmium in the case of the arc product. The spectrum of the gas obtained by heating these substances in a vacuum showed the lines of nitrogen, hydrogen, cadmium, and mercury, with some lines of argon, and the gas obtained by the action of phosphoric acid on the substance gave hydrogen, mercury, and argon lines—nitrogen could not be detected, but the product after the action contained ammonia. The nitrogen must have been derived from small traces of air in the argon used.

The spectroscopic examination was carried out in tubes fitted with aluminium electrodes, previously heated at 150° to expel gases. The tube gradually became "hard," and the nitrogen spectrum disappeared, leaving only the argon and hydrogen lines. This behaviour of the spectrum tube makes the source of the argon uncertain, as it is in very small quantities. The conclusion is drawn provisionally that the argon is absorbed by the nitride.

W. R.

Electrolytic Soda Industry. Theory of the Bell-chamber Process. ANDRÉ BROCHET (*Compt. rend.*, 1908, 147, 674—676).—The salt solution undergoing electrolysis flows through the apparatus from cathode to anode. If the velocity of the liquid is equal or superior to that of the OH⁻ ions, the yield should be theoretical. The velocity of the OH⁻ ion varies directly as the ionic mobility and current density, and inversely as the conductivity. When the layer of liquid containing only OH anions remains stationary, the concentration of the caustic alkali leaving the apparatus varies directly as the conductivity and inversely as the ionic mobility, but is independent of current density and the nature of the cation. It follows that solutions of potassium chloride give a stronger alkali than common brine. Temperature has no influence on the strength of alkali obtained, but a high temperature economises current.

R. J. C.

Transparent Silver and other Metallic Films. THOMAS TURNER (*Proc. Roy. Soc.*, 1908, A, 81, 301—310. Compare Beilby, *Abstr.*, 1904, ii, 647).—The investigations of Faraday on the conditions of formation of transparent metallic films have been extended. Gold leaf does not undergo any change at 500°, but rapidly becomes transparent at 550°, microscopic examination showing that the originally translucent film has become aggregated to opaque masses, leaving clear spaces between them. Soft gold, which has not

been mechanically strained, does not show this sudden change of properties.

Silver foil becomes slightly transparent in air at 240° , and more rapidly at higher temperatures. Heating to 500° in hydrogen or in charcoal powder does not produce transparency, whilst the effect on gold is independent of the surrounding gas. The presence of oxygen is necessary for the change in silver, although the quantity of oxygen absorbed is very minute. The particles of aggregated silver are smaller and less opaque than those of gold.

Copper undergoes a similar change, but much transparent oxide is formed. This is the origin of the coloured surface films obtained on oxidising copper. Aluminium and alloys of copper and zinc do not become transparent when heated.

C. H. D.

The True Atomic Weight of Silver according to Stas's Experiments. LOUIS DUBREUIL (*Compt. rend.*, 1908, 147, 856—859).—It has been shown previously (this vol., ii, 936) that it is generally impossible to deduce the true value of an atomic weight from the measurement of a single analytical ratio, and that the method of least squares enables the most probable value for the atomic weights in question to be determined in each experiment. Comparison of the values so obtained for the same element gives the means of determining the true atomic weight, and the result is the more probable the greater the number of methods employed. The author has applied this method of calculation to the values obtained by Stas for the analytical ratios of AgCl , I , AgI , Ag_2S , KCl , NH_4Cl , NaCl , LiCl , KBr , NaBr , NH_4Br , AgNO_3 , and Ag_2SO_4 , compared with Ag , and for the ratios KCl/AgNO_3 , $\text{NH}_4\text{Cl}/\text{AgNO}_3$, $\text{AgCl}/\text{AgClO}_3$, $\text{AgBr}/\text{AgBrO}_3$, and AgI/AgIO_3 , and, as a general mean of them all, has obtained the value 107.9921 for the atomic weight of silver, the extreme values of the series being 108.0313, obtained from the ratio AgI/Ag , and 107.9449, for the ratio KBr/Ag .

Taking into consideration the fact that all the results employed are taken from the work of one experimenter, the conclusion is drawn that silver has the atomic weight 108.

E. H.

Alloys of Silicon and Silver. G. ARRIVAUT (*Compt. rend.*, 1908, 147, 859—861).—Wöhler (*Ann. Chim. Phys.*, 1858, [iii], 54, 222), Warren (Abstr., 1889, 1125; 1893, ii, 474), and de Chalmot (Abstr., 1896, ii, 362) have obtained substances which they considered to be silver silicides, whereas Percy, Moissan (Abstr., 1896, ii, 173; 1904, ii, 560), and Vigouroux (Abstr., 1907, ii, 543) have repeatedly stated that silver and silicon do not combine. In view of this divergence of opinion, the author has examined mixtures of silver and silicon by Tammann's thermal method. The results are given in a table and in the form of curves.

Examination of the latter shows that the liquidus consists of two branches starting from the melting points of silver (950°) and silicon (1415°) respectively, and intersecting at about 800° in a point corresponding with about 5% of silicon. The solidus consists simply of a horizontal line passing through the eutectic point and extending

from 0% to 90% of silicon; thus silver and silicon do not give any point of combination. Consideration of the periods of eutectic crystallisation suggests the existence of mixed crystals of silicon and silver, but this is not confirmed by analysis. In the fusions containing 40–60% of silicon, a small, white pearl is observed on the bluish-grey button of slightly oxidised silicon. This is formed probably owing to the increase in volume of the silicon on solidification. It contains 4.8% of silicon and 94.85% of silver. E. H.

Silver Sub-halides. A. P. H. TRIVELLI (*Zeitsch. wiss. Photograph. Photophysik. Photochem.*, 1908, 6, 358–372).—A critical comparison of the two chief theories regarding the nature of the silver sub-halides. It is shown that the phenomena, which are usually cited in support of the view that the sub-halide is an adsorption compound of colloidal silver and silver halide, can be explained equally satisfactorily in terms of the theory that the sub-halide is a molecular compound. In certain cases, the molecular theory accounts for the observed facts more satisfactorily than the adsorption theory.

In an appendix, it is pointed out that the reducing action of ammonium persulphate can be explained more simply in terms of the molecular theory than by the adsorption hypothesis. The denser portions of the developed image contain more silver and silver sub-halide and less silver halide than the less dense regions. A sodium thiosulphate solution will, in consequence, be more quickly saturated with silver thiosulphate in the less dense parts of the image. In the denser regions, the greater concentration of unchanged sodium thiosulphate will cause the sub-halide to be decomposed to a greater extent, and the resulting greater concentration of free silver is the cause of the more energetic action of the ammonium persulphate. H. M. D.

Reaction between Silver Sulphide and Silver Sulphate. Production of a Dark-coloured Glass. OTTO SACKUR (*Ber.*, 1908, 41, 3356–3359).—Experiments to determine the dissociation pressure of the system $\text{Ag}_2\text{S} + \text{Ag}_2\text{SO}_4 = 4\text{Ag} + 2\text{SO}_2$ were unsuccessful, as, although a constant pressure was obtainable after heating at a constant temperature (above 300°) for some days, repetition of the experiment gave different values. The pressure at 300° is above 10 atmospheres.

When heated in Thüringian glass, the mixture imparts to the glass surface, below 400° , after some time a reddish-brown colour, which absorbs the actinic rays of the spectrum. Such a glass contains several per cent. of silver. W. R.

Preparation and Composition of the Hydrogen Carbonates of Calcium and Barium. EDWARD H. KREISER and SHERMAN LEAVITT (*J. Amer. Chem. Soc.*, 1908, 30, 1711–1714).—Experiments are described which show that calcium hydrogen carbonate is precipitated when potassium or ammonium hydrogen carbonate is added to a solution of calcium chloride at 0° , and that the salt can be separated and analysed if the temperature is not allowed to rise above 1° or 2° . Even at this temperature, the compound slowly decomposes. The results of analysis point to the formula $\text{CaCO}_3 \cdot 1.75\text{H}_2\text{CO}_3$.

Barium hydrogen carbonate can be obtained similarly by the action of ammonium hydrogen carbonate on barium chloride solution at 0° , but it undergoes gradual decomposition, and is therefore difficult to analyse. E. G.

Composition of the Hydrogen Carbonates of Calcium and Barium. EDWARD H. KEISER and LEROY McMASTER (*J. Amer. Chem. Soc.*, 1908, 30, 1714—1718).—Calcium and barium hydrogen carbonates were prepared in the manner described by Keiser and Leavitt (preceding abstract), except that precipitation was effected in a solution containing gelatin in order to retard decomposition. Analysis was effected by determining the ratio of carbon dioxide to calcium or barium oxide. The results show that the calcium salt has the composition $\text{CaCO}_3 \cdot 1.8\text{H}_2\text{CO}_3$, and the barium salt the composition $\text{BaCO}_3 \cdot 1.5\text{H}_2\text{CO}_3$. E. G.

Preparation of Calcium, Strontium, and Barium Silicides. TH. GOLDSCHMIDT (D.R.-P. 199193).—Calcium silicide may be produced by heating in an ordinary furnace a mixture of silicon and calcium oxide, the reaction being facilitated by the addition of some calcium fluoride and chloride. The interaction takes place as follows: $5\text{CaO} + 5\text{Si} = 2\text{CaSi}_2 + 3\text{CaO} \cdot \text{SiO}_2$. A similar change occurs with the oxides of the other alkaline earths. G. T. M.

Zinc Phosphides. PIERRE JOLIBOIS (*Compt. rend.*, 1908, 147, 801—803).—Zinc and phosphorus were heated together in a crucible until phosphorus vapour ceased to be evolved. The product was freed from excess of zinc either by ignition in a vacuum at 600° or by treatment with mercury or fuming nitric acid. The residual phosphide, Zn_3P_2 , is identical with that described by Vigier (*Bull. Soc. chim.*, 1861, 3, 5), and forms octahedral crystals, $D^{13} 4.55$, which dissolve readily in hydrochloric acid, giving pure phosphine.

The preparation of the phosphide, ZnP_2 , from its elements is also described. This phosphide is non-crystalline, and has $D^{16} 2.97$; at 400° , it undergoes dissociation into phosphorus and Zn_3P_2 . W. O. W.

Sulphides of the Rare Earths. I. Cerium Sulphides and their Limits of Existence. WILHELM BILTZ (*Ber.*, 1908, 41, 3341—3350. Compare Sterba, *Abstr.*, 1904, ii, 662).—*Cerium disulphide*, Ce_2S_4 , is prepared by heating cerium sulphide in a current of hydrogen sulphide at 580 — 600° , the experiment being controlled by weighing from time to time; 2 to 3 grams require twenty hours for complete conversion. It forms a dark yellowish-brown, crystalline powder, moderately stable in air and cold water. An oxygenated product, $\text{Ce}_2\text{S}_{2.5}\text{O}_2$, has also been obtained, and as this is of approximately the same weight as the disulphide, a complete analysis is necessary in characterising the compound. Hydrochloric acid (17.7%) dissolves the disulphide in the cold, an odour of hydrogen persulphide is noticed, and afterwards sulphur is precipitated. This is held to prove that the disulphide is not a true analogue of the dioxide, but a

polysulphide, $\text{Ce}_2\text{S}_3\cdot\text{S}$. The related *lanthanum disulphide*, $\text{La}_2\text{S}_3\cdot\text{S}$, is dark yellow, and also gives hydrogen persulphide under similar conditions.

The red sesquisulphide, Ce_2S_3 (Muthmann and Stützel, Abstr., 1900, ii, 142), is obtained on heating the disulphide or the sulphate in a current of hydrogen sulphide at $750\text{--}800^\circ$.

The conversion of the disulphide into the sesquisulphide has been examined up to 1200° . The temperature of decomposition is about 720° ; the lower sulphide is stable at a red heat, and does not react with hydrogen or nitrogen at that temperature, but between 1400° and 1500° it melts and decomposes. The sesquisulphide prepared at 745° ; when heated in a current of hydrogen sulphide for thirty hours at 615° , did not re-absorb sulphur. This irreversibility is only apparent, as by heating the disulphide in a current of hydrogen at 400° the sesquisulphide was obtained, and this product re-absorbed 4.2% sulphur.

The heat of solution of the disulphide, CeS_2 , in hydrochloric acid is 32,500 cal.; that of $\text{CeS}_{1.5}$, 37,800 cal. (39,500 cal. from product prepared at 400°). From these figures, the equation $4\text{CeS}_2 = 2\text{Ce}_2\text{S}_3 + 2\text{S}(\text{amorp.}) - 18,600 \text{ cal.}$ is calculated.

By the use of Nernst's equation for heterogeneous equilibria, the decomposition temperature is calculated to be 793° , whereas that found was roughly 720° . W. R.

Eutectics. I. The Alloys of Lead and Tin. WALTER ROSENHAIN with P. A. TUCKER (*Phil. Trans.*, 1908, A, 209, 89—122).—Alloys of pure lead and pure tin have been studied by thermal and microscopic methods, the curves of ordinary cooling and of differential cooling being taken. The eutectic point is at 62.33% of tin and 180° . Lead forms solid solutions with from 0 to 16% Sn at 180° . Former observers have found the presence of eutectic in alloys containing much less tin, and this is shown to be due to the slowness with which diffusion takes place in the solid alloys. Heating at 175° for six weeks was found to be necessary to bring about equilibrium. On the other hand, tin does not form solid solutions with small quantities of lead.

Alloys containing from 18 to 63% of tin undergo a change, accompanied by development of heat, on cooling to 149° . In alloys containing from 8 to 18% Sn, the transformation takes place at lower temperatures, the passage of the solid solution from the β - to the α -form involving the rejection of a part of the tin. The alloy with 8% Sn appears to remain in the β -form down to the temperature of liquid air. The lead constituent of the eutectic, however, appears to remain in the metastable β -form. The density of the alloys confirms the view that the lead constituent of the eutectic differs from the stable α -solid solution.

A microscopic study of the eutectic alloy shows that it is composed of grains, within each of which the crystallites have a definite orientation. Each grain is to be regarded as a spherulitic crystal of the β -solution, the tin forming a matrix or filling.

The paper is illustrated with photo-micrographs.

C. H. D.

Electrolytic Corrosion of Brasses in Synthetic Sea-Water. AZARIAH T. LINCOLN and G. C. BARTELS, jun. (*J. Physical Chem.*, 1908, 12, 550—556. Compare Lincoln, Klein, and Howe, *Abstr.*, 1907, ii, 953).—The corrosion of fully annealed copper-zinc alloys was measured, using an artificial sea-water prepared by dissolving salts. The corrosion curves are similar to those obtained in solutions of sodium chloride. With the appearance of the γ -phase, copper ceases to appear in the corrosion product. C. H. D.

Recalculation of the Vapour Pressure of Mercury. T. H. LABY (*Phil. Mag.*, 1908, [vi], 16, 789—796).—The recorded observations of the vapour pressure of mercury have been compared, and the more concordant values have been combined with the object of obtaining a table of most probable values. Two Kirchhoff formulae are given which satisfactorily express the recorded observations. The vapour-pressure values (in terms of mm. of mercury at 0°) are recorded for every 5° between 15° and 365°, and also for 370°, 380°, 390°, 400°, and 450°. It is also shown that the experimental data of Cailletet, Colardeau, and Rivière for temperatures up to 700° can be satisfactorily expressed by means of a Kirchhoff formula. H. M. D.

Constitution of Certain Mercuric Compounds with Complex Cations. II. VINCENZO BORELLI (*Gazzetta*, 1908, 38, ii, 421—474. Compare this vol., i, 515).—According to Abegg and Bodländer's principle of electro-affinity (*Abstr.*, 1899, ii, 542), the tendency of the mercuric halogen salts to form complex cations is weaker the stronger the anion combining with the mercuric ion to form the cation, since increase of the electro-affinity of the halogen radicle should be accompanied by an increase in the tendency of the radicle to dissociate according to the scheme: $\text{HgX}' \rightarrow \text{Hg}'' + \text{X}'$. This is actually found to be the case, the tendency to form these complex ions being greatest with mercuric iodide and cyanide, less marked with the bromide, and so slight with the chloride that the corresponding double salt cannot be isolated. The author has studied the complex salts formed by mercuric iodide, bromide, chloride, and thiocyanate with mercuric perchlorate, the results obtained being parallel with those observed in the case of the similar complex salts yielded by mercuric cyanide. The behaviour of insoluble mercuric compounds of the type HgX'' toward mercuric salts with strong anions is quite analogous to that of the insoluble salts of the type HgX' .

Iodomercury perchlorate, $\text{HgI} \cdot \text{ClO}_4$, forms bundles or mammillary masses of white, opaque prisms, which deliquesce and turn yellow in the air, and are decomposed by water with liberation of mercuric oxide. Cryoscopic measurements in water give values for the molecular weight lower than that calculated for complete dissociation of the compound into its components and allowing for the partial hydrolysis of the mercuric perchlorate according to the equation: $\text{Hg}(\text{ClO}_4)_2 + \text{H}_2\text{O} = \text{Hg}(\text{OH}) \cdot \text{ClO}_4 + \text{HClO}_4$ (compare Heimbucher, *Dis.*, Würzburg, 1904; *Abstr.*, 1904, ii, 465). The depression of the

freezing point of water by mercuric perchlorate is diminished by mercuric iodide, the diminution increasing with the proportion of iodide present in the solution; the complex molecular concentration hence undergoes a corresponding diminution. Similar behaviour is observed when mercuric cyanide is dissolved in an excess of a concentrated solution of mercuric perchlorate. The conductivity of mercuric perchlorate solution is also diminished by the presence in the solution of mercuric iodide, owing to diminution of the ionic concentration and to the lower mobility of the new ions formed. The addition of mercuric iodide or cyanide produces an increase in the molecular concentration of mercuric perchlorate solution when this is not excessively concentrated, and a diminution when an excess of the perchlorate is present. These results are regarded as due to various reactions between the mercuric iodide and the ions, Hg^{++} and ClO_4^- , originally present in the solution. The analogy between these results and those obtained with mercuric cyanide indicates that the mercuric iodide unites with the Hg^{++} ions to give complex cations; this view is supported by transport measurements of solutions of mercuric iodide containing excess of the perchlorate.

Bromomercuric perchlorate, $\text{HgBr}\cdot\text{ClO}_4$, forms bundles or mamillary masses of short, white prisms. When mercuric bromide is dissolved in a solution of mercuric perchlorate, it causes depression of the freezing point and regular elevations of the boiling point, and, consequently, an increase in the concentration. Into these solutions, mercuric bromide enters under the form of the ions HgBr^+ , and also, to a slight extent, of the ions $\text{Hg}_2\text{Br}_2^{++}$. The existence of these complex ions is shown by measurements of the variation of the concentration of mercuric bromide at the electrodes during electrolysis.

Chloromercuric perchlorate could not be isolated. The presence of 1 mol. of mercuric chloride per mol. of the perchlorate in solution produces an increase of 0.028% in the original conductivity, but the addition of a further 1.5 mols. of the chloride causes no further increase. The conductivity curve shows that mercuric chloride exhibits a tendency to form the ions HgCl^+ about 500 times less than the tendency of the cyanide to form the ions HgCN^+ .

The author has not succeeded in isolating chloromercuric nitrate, $\text{HgCl}\cdot\text{NO}_3$ (compare Morse, Abstr., 1903, ii, 12), but conductivity measurements demonstrate the undoubted presence of the ions HgCl^+ and NO_3^- in solutions containing mercuric chloride and nitrate.

Thiocyanomercuric perchlorate, $\text{Hg}(\text{CNS})\cdot\text{ClO}_4$, was obtained as a white, crystalline crust. The addition of mercuric thiocyanate to a solution of mercuric perchlorate produces a diminution in the molecular concentration.

The author has been unable to prepare the compound, $2\text{Hg}(\text{ClO}_4)_2\cdot\text{HgO}\cdot 12\text{H}_2\text{O}$, described by Chikashigé (Trans., 1905, 87, 822), the products obtained being basic compounds containing approximately $2\text{Hg}(\text{ClO}_4)_2$ per 3HgO . When mercuric oxide is dissolved in a solution of mercuric perchlorate, it produces diminution of the molecular concentration; the diminution produced increases with the concentration

of the perchlorate solution, as, therefore, does the complexity of the compounds formed.

T. H. P.

Precipitation of Gelatinous Mixtures of Alumina and Silica, and their Relation to Allophane, Halloysite, and Montmorillonite. H. STREMMER (*Centr. Min.*, 1908, 622—632, 661—669).—The gelatinous precipitates obtained from solutions of sodium silicate and aluminium acetate are of very variable composition, depending on the strength of the solutions and on their acidity. In an acid solution there is at first only a turbidity, and the gelatinous precipitate afterwards deposited is richer in silica than that from a neutral solution.

Carbonic acid and acetic acid dissolve the alumina more readily than the silica from the precipitates. The conclusion is drawn that these precipitates do not represent any definite hydrated aluminium silicate, but that they are simply mixtures of gelatinous aluminium hydroxide and hydrated silica. The same relations also exist in the various amorphous minerals of the clay group. The published analyses of these are tabulated, and they show wide variations in composition: for minerals of the allophane group, the ratio $\text{Al}_2\text{O}_3:\text{SiO}_2$ varies from 1:0.31 to 1:1.91; for the halloysite group, 1:1.68 to 1:3.89; and for the montmorillonite group, 1:2.51 to 1:5.32. The conclusion is therefore drawn that these are not definite mineral species, but mixtures in variable proportions of colloidal aluminium hydroxide and hydrated silica.

L. J. S.

Ferromagnetic Nitrogen Compounds of Manganese. EDGAR WEDEKIND and THEO. VEIT (*Ber.*, 1908, 41, 3769—3773. Compare Abstr., 1907, ii, 353; Shukoff, this vol., ii, 484).—With the object of ascertaining whether elements which are gases at the ordinary temperature form ferromagnetic derivatives with manganese, the nitrides of manganese have been investigated. Trimanganese nitride, Mn_3N_2 (compare Prelinger, Abstr., 1894, ii, 16), has only feeble magnetic properties, whilst pentamanganese nitride, Mn_5N_2 , is slightly more magnetic. The nitride, Mn_7N_2 , obtained by the action of ammonia on manganese heated with an oxy-hydrogen blowpipe, has stronger magnetic properties than either of the above nitrides, and is almost as magnetic as manganese boride; it is readily attacked by acids and alkalis.

Chromium nitride, CrN , has only feeble magnetic properties.

W. H. G.

The System Iron-Phosphorus. E. GERCKE (*Metallurgie*, 1908, 5, 604—609).—Alloys rich in phosphorus were prepared by adding red phosphorus to molten iron in a magnesite crucible. The product containing 17.3% P was re-melted with different proportions of iron. The eutectic temperature is 980° ; mixtures low in phosphorus show considerable undercooling. Iron retains up to 1.70% of phosphorus in solid solution, beyond this the eutectic, containing 10.2% P, is present as a constituent. The solid solution undergoes a change of structure, which has not been fully investigated, at 600° .

C. H. D.

The Ternary System Iron-Phosphorus-Carbon. PAUL GOERENS and W. DOBBELSTEIN (*Metallurgie*, 1908, 5, 561—566. Compare Wüst, this vol., ii, 287).—The ternary eutectic point of the system is found to lie at 1.96% C, 6.89% P, and 91.15% Fe, and at 953°. The position of the three binary eutectic curves in the system iron-iron carbide-iron phosphide has also been determined. Both thermal and microscopic methods have been employed.

The microscopic sections are best prepared by etching and heat-tinting, subsequently re-polishing lightly. The oxide film is much more readily removed from cementite than from the phosphide, thus allowing the two to be distinguished. C. H. D.

The Iron-Carbon Equilibrium. GEORGE B. UPTON (*J. Physical Chem.*, 1908, 12, 507—549).—The results of other observers are examined and recalculated, the silicon and other elements present in the samples examined being calculated as "equivalent carbon." The author concludes that cementite must find a place in the diagram of stable equilibrium, and he assumes the formation of three carbides in all, Fe_3C , Fe_2C , and Fe_7C_3 , of which the first is stable only above 800° and the second above 600°. The brittleness of steel at 500—550° is considered to be due to the change from Fe_3C to Fe_2C . An equilibrium diagram has been constructed on these assumptions. C. H. D.

Hydrolysis of Ferric Chloride; Influence of Neutral Salts. G. MALFITANO and LEOPOLD MICHEL (*Compt. rend.*, 1908, 147, 803—806. Compare Abstr., 1907, ii, 692; this vol., ii, 111, 288).—The phenomena of the colloidal state are more pronounced and appear more rapidly in solutions of ferric chloride to which potassium chloride has been added than in solutions of ferric chloride alone. The authors have measured the increase in electrical conductivity of solutions of ferric chloride, alone and with varying amounts of potassium chloride, produced by raising the temperature from 18° to 100° for fifteen minutes, and after allowing the solutions to remain for sixteen and twenty-four hours respectively. The results lead to the conclusion that the rate of hydrolysis of the ferric chloride depends on the proportion of potassium chloride present, and that the size of the micro-cells of ferric hydroxide is increased by the addition of this salt. The number of ferric ions being diminished, there are fewer centres of attraction for the ferric hydroxide molecules, and consequently the individual cells are more voluminous.

The chlorides of sodium, ammonium, barium, and magnesium, and also potassium nitrate, behave in a similar manner. Mercuric chloride, on the other hand, being a non-electrolyte, has no appreciable influence on the course of the hydrolysis. Salts containing multivalent negative ions, such as potassium sulphate, behave like the multivalent acids previously studied in hindering hydrolysis. W. O. W.

Molybdates of Nickel and Cobalt. M. EMMANUEL POZZI-ESCOR (*Bull. Soc. chim.*, 1908, [iv], 3, 1012).—The author has been informed by Marckwald that the attribution to the latter by Grossmann and

Schück (this vol., ii, 230) of certain work on nickel and cobalt molybdates is inaccurate. T. A. H.

Antimony Trichloride as Ionising Solvent. Z. KLEMENSIEWICZ (*Bull. Acad. Sci. Cracow*, 1908, 485—494).—The measurements were made by the electrical conductivity method with platinised electrodes in the usual way. The carefully-purified solvent has D_{25}^0 2.681 and D_{27}^0 2.647; the smallest conductivity observed amounted to 8.5×10^{-7} reciprocal ohms.

As solutes, the chlorides of potassium, rubidium, ammonium, and thallium were used, and measurements were made up to a dilution of 1024 litres and at different temperatures. The conductivities in dilute solutions are greater, in concentrated solutions (above $N/10$) less, than for the corresponding aqueous solutions. It is probable that the degree of ionisation is less for solutions in antimony chloride than in water, but that the ionic velocity is greater in the former case. The conductivity of the solutions increases regularly with the temperature from 70° to 150 — 200° .

The viscosity of antimony trichloride has been measured from 80° to 200° . The curve obtained by plotting the fluidity (reciprocal of the viscosity) against the temperature appears to show a change of direction at 120° , but a high degree of accuracy is not claimed for the results. G. S.

Melting-point Curves for the Systems Bismuth + Chlorine and Bismuth + Bromine. B. G. EGGINK (*Zeitsch. physikal. Chem.*, 1908, 64, 449—505).—After reviewing the various compounds of bismuth with chlorine and bromine which have been described, the author proceeds to a theoretical discussion of the possible liquid-solid equilibria in a system of two components in which two liquid phases may occur. In this discussion, the author uses the graphical method introduced by van Ryn van Alkemade (*Abstr.*, 1893, ii, 363).

The experimental study of the systems bismuth + chlorine and bismuth + bromine has shown that compounds of the formulæ BiCl and BiBr exist, which, on melting at 320° and 287° respectively, both form two liquid phases. Further, an endothermic compound BiCl_4 exists, which is only slightly dissociated in the fused condition. So far as the evidence of the freezing-point curve goes, there are no compounds of the formulæ BiCl_2 , BiBr_2 , and Bi_3Cl_8 ; the author's results are therefore not in harmony with those of Herz and Guthmann (this vol., ii, 199). J. C. P.

Columbium. CLARENCE W. BALKE and EDGAR F. SMITH (*J. Amer. Chem. Soc.*, 1908, 30, 1637—1668).—A continuation of the investigation of the compounds of columbium and tantalum (*Abstr.*, 1905, ii, 828, 829). The conclusion is confirmed that the coloration produced on the addition of hydrogen peroxide to a solution of columbium in hydrofluoric acid is not due to the presence of titanium, but is probably due to columbium itself. A large quantity of potassium columbium fluoride, K_2CbF_7 , was prepared and carefully purified, and was after-

wards converted into the oxide, which had D 4.8. This oxide still gave the reaction with hydrogen peroxide, and, in order to study further the question as to whether the reaction might not be due to the presence of some other element, the oxide was converted into the chloride, and the latter fractionally distilled. The whole of the product distilled at about 241° , and no differences could be detected between the fractions obtained. On a spectroscopic examination of the oxide prepared from the chloride, neither tantalum nor titanium lines were observed. Vapour density determinations of the chloride by Dumas' method gave a mean value of 9.45, as compared with the calculated value 9.35 [Cb = 93.5]. Specimens of the oxide prepared from the chloride had D varying from 4.48 to 5.02. The chloride had D 2.73–2.77. A careful determination of the atomic weight of columbium based on the ratio between the chloride and oxide gave as mean of eight determinations the value 93.50 [O = 16; Cl = 34.45].

A résumé is given of the various columbates described in the literature. Sodium columbate, $\text{Na}_2\text{O} \cdot \text{Cb}_2\text{O}_5 \cdot 7\text{H}_2\text{O}$, crystallises in triclinic prisms [$a : b : c = 0.9559 : 1 : 0.8394$; $\alpha = 71^{\circ}20'$; $\beta = 105^{\circ}30'$; $\gamma = 54^{\circ}7'$]. Magnesium columbate, $\text{MgO} \cdot \text{Cb}_2\text{O}_5 \cdot 7\text{H}_2\text{O}$, the silver salt, $\text{Ag}_2\text{O} \cdot \text{Cb}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$, the copper salt, $\text{CuO} \cdot \text{Cb}_2\text{O}_5 \cdot 3\frac{1}{2}\text{H}_2\text{O}$, the aluminium salt, $\text{Al}_2\text{O}_3 \cdot 3\text{Cb}_2\text{O}_5 \cdot 12\text{H}_2\text{O}$, and the cadmium salt, $\text{CdO} \cdot \text{Cb}_2\text{O}_5 \cdot 3\frac{1}{2}\text{H}_2\text{O}$, are described. The potassium salt, $4\text{K}_2\text{O} \cdot 3\text{Cb}_2\text{O}_5 \cdot 16\text{H}_2\text{O}$, forms monoclinic crystals [$a : b : c = 0.7120 : 1 : 0.5547$; $\beta = 84^{\circ}19'$]. The rubidium salt, $4\text{Rb}_2\text{O} \cdot 3\text{Cb}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$, is isomorphous with the salts

$4\text{Cs}_2\text{O} \cdot 3\text{Cb}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$, and $4\text{Cs}_2\text{O} \cdot 3\text{Ta}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$, and crystallises in monoclinic prisms [$a : b : c = 0.8815 : 1 : 1.4091$; $\beta = 84^{\circ}7'$]. The following columbates are also described: $7\text{K}_2\text{O} \cdot 6\text{Cb}_2\text{O}_5 \cdot 27\text{H}_2\text{O}$,

$7\text{Cs}_2\text{O} \cdot 6\text{Cb}_2\text{O}_5 \cdot 30\text{H}_2\text{O}$, and $3\text{Rb}_2\text{O} \cdot 4\text{Cb}_2\text{O}_5 \cdot 9\frac{1}{2}\text{H}_2\text{O}$.

The following percolumbates have been obtained: Na_2CbO_5 , K_3CbO_8 , Rb_3CbO_8 , Cs_3CbO_8 , $\text{MgNaCbO}_8 \cdot 8\text{H}_2\text{O}$, $\text{MgKCbO}_8 \cdot \text{H}_2\text{O}$, $\text{MgRb}_2\text{CbO}_8 \cdot 7\frac{1}{2}\text{H}_2\text{O}$, $\text{MgCsCbO}_8 \cdot 8\text{H}_2\text{O}$, $\text{CaNaCbO}_8 \cdot 4\text{H}_2\text{O}$, and $\text{CaKCbO}_8 \cdot 4\text{H}_2\text{O}$.

The sodium columbium fluorides, $3\text{NaF} \cdot \text{CbOF}_3$ and

have been prepared, but the salts, $2\text{NaF} \cdot \text{CbOF}_3 \cdot 2\text{H}_2\text{O}$ and

described by Marignac could not be obtained. The existence of the potassium salts, $2\text{KF} \cdot \text{CbOF}_3 \cdot \text{H}_2\text{O}$, $3\text{KF} \cdot \text{CbOF}_3$, $3\text{KF} \cdot \text{HF} \cdot \text{CbOF}_3$, $5\text{KF} \cdot 3\text{CbOF}_3 \cdot \text{H}_2\text{O}$, $4\text{KF} \cdot 3\text{CbOF}_3 \cdot 2\text{H}_2\text{O}$, and $2\text{KF} \cdot \text{CbF}_5$, described by Marignac, was confirmed. The salt $3\text{KF} \cdot \text{HF} \cdot \text{CbOF}_3$ forms monoclinic needles [$a : b : c = 0.6304 : 1 : 0.4888$; $\beta = 86^{\circ}41'$]. The double fluoride, $2\text{RbF} \cdot \text{CbF}_3$, described by Pennington (Abstr., 1896, ii, 305) could not be obtained, but the following salts were prepared:

$\text{RbF} \cdot \text{CbF}_5$, and $2\text{RbF} \cdot \text{CbO}_2\text{F}_3 \cdot \text{H}_2\text{O}$. The rubidium tantalum salt, $2\text{RbF} \cdot \text{TaO}_2\text{F}_3 \cdot \text{H}_2\text{O}$, forms thin, white leaflets. The caesium salts, $2\text{CsF} \cdot \text{CbOF}_3$ and $\text{CsF} \cdot \text{CbF}_5$, are described. The thallium salt,

forms orthorhombic crystals [$a : b : c = 0.4261 : 1 : 1.0129$].

A study has been made of the double tantalates. The salt
 $4\text{Rb}_2\text{O} \cdot 3\text{Ta}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$
 forms monoclinic crystals [$a:b:c=0.8822:1:1.0510$; $\beta=84^\circ 2'$].
 The salts $4\text{Cs}_2\text{O} \cdot 3\text{Ta}_2\text{O}_5 \cdot 14\text{H}_2\text{O}$ and $7\text{Cs}_2\text{O} \cdot 6\text{Ta}_2\text{O}_5 \cdot 38\text{H}_2\text{O}$ are also
 described.

The following *pertantalates* have been prepared: Rb_3TaO_8 , Cs_3TaO_8 ,
 $\text{MgNaTaO}_8 \cdot 8\text{H}_2\text{O}$, $\text{MgKTaO}_8 \cdot 7\text{H}_2\text{O}$, $\text{MgRbTaO}_8 \cdot 9\text{H}_2\text{O}$, and
 $\text{CsNaTaO}_8 \cdot 4\frac{1}{2}\text{H}_2\text{O}$.

E. G.

Spectrum and the Bromides of Columbium. WILLIAM M. BARR (*J. Amer. Chem. Soc.*, 1908, 30, 1668—1672).—It has been shown by Hall and Smith (Abstr., 1905, ii, 829) that the hydrogen peroxide test for titanium in a solution of columbium in hydrofluoric acid is not trustworthy. For this reason, spectroscopic examination has been resorted to. Hildebrand (following abstract) has submitted carefully-purified columbium oxide prepared by Balke and Smith (preceding abstract) to a spectroscopic examination, and has found that, whilst nearly all the titanium lines were absent from the spectrum, certain lines were present which are common to both metals. A study has therefore been made of the spectra of specimens of columbium oxide prepared from minerals of different character and from different localities, and purified by Balke and Smith's methods. The results indicate that these methods of purification are efficient, that the spectra of columbium from all sources are identical, and that the lines common to both the columbium and titanium spectra are not due to the presence of titanium in the columbium, and probably not to any other element, but are merely coincident lines.

The "Niobunterbromid" described by Rose (*Ann. Phys. Chem.*, 1858, 104, 441) has been studied, and found to be columbium oxybromide, CbOBr_3 . The dark red compound formed simultaneously is the pentabromide, CbBr_5 , as stated by Rose. Both these salts are described.

A columbium iodide has been prepared from the bromide, and is being investigated.

E. G.

Arc Spectrum of Columbium. JOEL H. HILDEBRAND (*J. Amer. Chem. Soc.*, 1908, 30, 1672—1684. Compare Balke and Smith, and Barr, preceding abstracts).—The arc spectrum of columbium has been measured between $\lambda 2600$ and $\lambda 6000$, using specimens of the oxide obtained from euxenite, tantalite, columbite, and aeschynite. The results are tabulated.

It has been found that Balke and Smith's method for preparing columbium oxide, free from titanium, is satisfactory, and that the existence of any element common to columbium and titanium is very improbable. The identity of the spectra of columbium from different sources affords strong evidence of its elementary character.

E. G.

Metallographic and Metallurgical Notes. [Thermal Diagrams. Microscopy of Alloys.] K. FRIEDRICH (*Metallurgie*, 1908, 5, 593—604).—I. It was found impossible to obtain thermal

diagrams of the systems platinum-sulphur, gold-selenium, gold-sulphur, gold-arsenic, or zinc-sulphur on account of the volatility of one component. The existence of the sulphide, Zn_2S , is improbable.

II. The use of ultra-violet light in the microscopic study of alloys is not found to have any advantages.

C. H. D.

Atomic Weight of Palladium. GEORGE I. KEMMEER (*J. Amer. Chem. Soc.*, 1908, 30, 1701—1705).—The results of previous work on the atomic weight of palladium show considerable variation, and, for this reason, the present investigation was undertaken. The experiments were carried out with (A) palladodiammonium chloride purified by Keller and Smith's method (*Abstr.*, 1893, ii, 73); (B) the same salt purified by means of ammonium cyanide instead of the mercuric cyanide used by Keller and Smith, and ammonium salts instead of sodium or potassium salts, and (C) palladodiammonium cyanide, $\text{Pd}(\text{NH}_3\text{CN})_2$. In each case a porcelain boat containing the salt was enclosed in a tube heated by an electric heater, and was reduced to the metal by means of carefully-purified electrolytic hydrogen. The following results were obtained: salt A, mean of five experiments, 106.399; salt B, mean of four experiments, 106.442; salt C, mean of six experiments, 106.458. The mean value of all the determinations gave an atomic weight, 106.434 [$\text{Cl}=35.473$; $\text{H}=1.008$; $\text{N}=14.01$].

Mineralogical Chemistry.

Natural Zirconium Oxide Free from Iron. EDGAR WEDEKIND (*Zeitsch. angew. Chem.*, 1908, 21, 2270—2271).—Of the three forms in which Brazilian zirconium ore occurs, that containing the greatest amount of zirconium is the black, glassy, lump variety; analysis gave:

ZrO_2	TiO_2	Fe_2O_3	SiO_2	ZrSiO_4	Total.
94.12	0.98	3.22	0.43	1.98	100.73

When examined under the microscope, this mineral was found to be composed of black particles embedded in a brownish-yellow, powdery substance. When separated mechanically, the black portion was found to be quite free from iron; analysis gave:

ZrO_2	SiO_2	TiO_2	Insol.	Total.
97.97	1.72	1.20	0.10	100.99

From this it is evident that the colour previously ascribed to the presence of iron must be caused by the titanium, as, indeed, must be the colour of many other stones and minerals. Crystalline, natural zirconium oxide is feebly radioactive; it has D 5.41, a value somewhat higher than that, D 5.1, of the artificial, crystalline substance.

J. V. E.

Kröhnkite, Natrochalcite (a New Mineral), and Other Sulphates from Chile. CHARLES PALACHE and CHARLES H. WARREN (*Amer. J. Sci.*, 1908, [iv], 26, 342—348 *).—The specimens described are from copper veins in the mining district of Chuquicamata, in the province of Antofagasta, and include kröhnkite, natrochalcite, blödite, brochantite, atacamite, chalcantinite, copiapite, botryogen, sideronatrite, halite, and gypsum.

Kröhnkite.—The large, well-developed crystals are monoclinic, with $a : b : c = 0.5229 : 1 : 0.4357$; $\beta = 56^{\circ}17\frac{1}{2}'$; they are twinned on (001), and have a perfect cleavage parallel to (010); hardness $2\frac{1}{2}$. Three types of specimens are distinguished: (i) clusters of octahedroid crystals of a dull greenish-blue colour; (ii) single prismatic crystals and fibrous or acicular aggregates of a pale blue colour; (iii) solid crusts of large, prismatic crystals of a deep vitriol-blue colour. Analysis I gives the usual formula: $\text{CuSO}_4 \cdot \text{Na}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$. The water is mainly given off below 150° , but small amounts continue to come off up to 350° . The mineral is fusible without decomposition to a bright green enamel.

Natrochalcite.—This new species occurs as bright emerald-green, monoclinic crystals with an acute pyramidal habit [$a : b : c = 1.423 : 1 : 1.214$; $\beta = 61^{\circ}17\frac{1}{2}'$]. Cleavage (001) perfect; hardness $4\frac{1}{2}$. Complete optical determinations are given for this, as also for kröhnkite. Analysis II agrees with $\text{Na}_2\text{SO}_4 \cdot \text{Cu}_4(\text{OH})_2(\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$. The water is given off gradually above 150° , and between 350° and a low red-heat, sulphuric anhydride is expelled. The mineral readily fuses to a black bead.

Blödite.—Analysis III, of massive, granular material, agrees with the usual formula: $\text{MgSO}_4 \cdot \text{Na}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$.

	CuO.	MgO.	Na ₂ O.	SO ₃ .	H ₂ O.	Insol.	Cl.*	Total.	Sp. gr.
I.	23.25	—	18.89	47.60	10.72	—	trace	100.46	2.061
II.	41.95	—	8.44	42.10	7.70	0.70	0.05	100.94	2.33
III.	—	12.00	18.20	47.49	21.60	0.50	—	99.70	—

L. J. S.

Analyses of Gabbroitic Rocks from Neurode, Silesia. FELIX TANNHÄUSER (*Sitzungsber. k. Akad. Wiss. Berlin*, 1908, 1069—1075).—Nine analyses are given of gabbro, anorthosite, pyroxenite, olivine-gabbro, troctolite, serpentine, diabase, gabbro-aplite, and spessartite.

L. J. S.

Physiological Chemistry.

Heats of Solution of Gases in Blood. MARIO CAMIS (*Mem. Real. Accad. Sci. Torino*, 1908, [ii], 58, 141—169).—The author has measured calorimetrically the heat changes occurring when oxygen and carbon dioxide pass into, or out of, solution in blood. The absorption of 1 gram-mol. of carbon dioxide by the blood is accompanied by the evolution of 5.40 Cal., the corresponding value for oxygen being

* and *Zeitsch. Kryst. Min.*, 1908, 45, 529—538.

10-22 Cal. Taking mean numbers for the daily respiratory exchange, it is calculated that, for a man weighing 70 kilos., this exchange leads to the production of about 127 Cal. per day. The blood pigment and the oxygen absorbed probably react endothermically. The paper concludes with a bibliography. T. H. P.

Estimation of the Respiratory Capacity of Small Quantities of Blood. HEINRICH DRESER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 138—149).—Certain modifications of Haldane's carbon monoxide method, and of Barcroft's gas analysis methods, are proposed. In investigating the effect of certain antipyretics on the respiratory capacity, it was found that many of these produce methæmoglobin formation, and the oxygen so combined is not displaced by carbon monoxide. A comparison of *m*-tolylhydrazine, β -acetylphenylhydrazine (pyrodine), and the semicarbazide of *m*-tolylhydrazine shows that the semicarbazide substitution is much less harmful than the acetyl substitution, as in acetanilide and phenacetin. W. D. H.

Glycine in Normal Blood. ADOLF BINGEL (*Zeitsch. physiol. Chem.*, 1908, 57, 382—388).—By the use of the Fischer-Bergell naphthalenesulphonyl chloride method, it is possible to demonstrate the existence of glycine in normal ox-blood. From 10 litres, 0.2 gram of the glycine compound was obtained. A higher amino-acid, or a peptide-like substance, is also present. W. D. H.

Reaction of the Blood after Intravenous Injection of Acid and Alkali. N. VAN WESTENRYK (*Arch. exp. Path. Pharm., Suppl.*, 1908, 517—527).—That the titration method shows the blood to be alkaline is due to the fact that the acid used may displace a weaker acid in neutral salts. Many indicators are not indifferent chemical substances, but may be themselves acid or basic. By the use of neutral-red and other indicators, the reaction of the blood is shown to be neutral, and remains neutral under various pathological conditions. It alters in experimental acid or alkali poisoning. Alkali poisoning produces stimulation, increasing the action of the heart and kidneys; acid produces the opposite effects. In acid poisoning, the organism remains neutral, as the acid is fixed and neutralised in the muscular tissues. Previous observations that the alkalinity of the blood decreases on destruction of the red corpuscles, are confirmed by the new methods. W. D. H.

Spectrophotographic Investigations on the Action of Hydrocyanic Acid on Blood. LOUIS LEWIN (*Arch. exp. Path. Pharm., Suppl.*, 1908, 337—348).—Details are given of the spectroscopic appearances of blood and hæmoglobin treated with hydrocyanic acid. Cyanomethæmoglobin and cyanohæmatin do not appear to exist; the spectroscopic appearances of their so-called compounds are identical with those of cyanohæmoglobin. Blood so treated catalyses hydrogen peroxide quite typically. The cause of the toxic action of hydrocyanic acid is discussed, and the conclusion is drawn that it is not a blood poison in the biological sense. W. D. H.

Action of Oxidising Salts. ARTHUR R. CUSHNY (*Arch. exp. Path. Pharm., Suppl.*, 1908, 126—137).—The relative activity of oxidising salts on the blood and tissues runs fairly parallel to their oxidising power on simpler chemical compounds. But in many cases other factors step in. The blood corpuscles and pigment react more readily to weak oxidising agents than do muscle or epithelium. In certain cases, also, substances which oxidise blood corpuscles and pigment readily are feeble oxidising agents for simpler chemical substances; the reverse is also seen.

W. D. H.

Hæmolytic Action of Mercury Salts. J. DUNIN-BORKOWSKI (*Bull. Acad. Sci. Cracow*, 1908, 494—505).—The hæmolytic action of mercury salts on the serum-free blood corpuscles (erythrocytes) of different animals has been investigated. With mercuric chloride, the resistance to hæmolysis increases in the order: guinea-pig, sheep, cow, pig, calf, dog. A higher concentration of mercuric chloride than that required to produce complete hæmolysis, agglutinates the erythrocytes.

Mercuric iodide has considerable hæmolytic activity, and mercuric fluoride, although not ionised, is almost as active as the chloride. Potassium cyanide is less active than mercuric cyanide. It follows that hæmolysis does not depend on the concentration of Hg^{++} ions alone, although the ionic concentration probably has some effect, as sodium chloride lessens the activity of mercuric chloride.

The rate of hæmolysis with different concentrations of mercuric chloride has also been measured. With small concentrations, the constants calculated for a unimolecular reaction diminish, and with fairly high concentrations they increase considerably during the reaction, being approximately constant for intermediate concentrations.

The temperature-coefficient for 10° between 18° and 25° is 4.37 for erythrocytes from the guinea-pig, and 2.6 between 18° and 32° for those from the dog. The coefficient is much greater at higher temperatures, owing to the fact that hæmolysis is produced to some extent by heat alone, and, further, the erythrocytes which have been heated alone for some time are much more readily acted on by mercuric chloride than those which have not been heated.

G. S.

Peptolytic Ferments in the Stomach Contents. EMIL BERGHAARDEN and FLORENTIN MEDIGRECEANU (*Zeitsch. physiol. Chem.*, 1908, 57, 317—324).—The observations were made on a dog with gastric fistula, and confirm those made by Boldyreff, that, after a meal rich in fat, the contents of the duodenum regurgitate into the stomach. Under these conditions, the stomach contents contain a peptolytic ferment, and when neutralised, resolve glycyl-L-tyrosine into its constituent amino-acids. Under ordinary conditions, however, the ferment is rendered rapidly inactive by the acid of the gastric juice.

W. D. H.

Influence of the Products of Reaction on the Hydrolysis of Fats by Pancreatic Juice. Mlle. L. KALABOUKOFF and Émile TERROINE (*Compt. rend.*, 1908, 147, 712—715).—Both fatty acids and their sodium salts diminish the rate of hydrolysis; glycerol, on the other hand, has a considerable accelerating action. This acceleration does not take place when a soluble ester, such as monobutyryl, or natural emulsions, such as egg-yolk or cream, or solid fats, such as lard, are submitted to the action of the juice. The action of the glycerol is to be ascribed to the fact that a better distribution of the lipase between the aqueous and oily phases takes place in its presence; other syrupy substances can produce a similar acceleration.
S. B. S.

Digestion in Animals. XXVII. Relationship of Concentration to Absorption in the Intestine. E. S. LONDON and W. W. POLOWZOWA (*Zeitsch. physiol. Chem.*, 1908, 57, 529—546. Compare this vol., ii, 960).—Details are given of the relative amount of absorption in the intestine of the water and sugar contained in solutions of dextrose of different concentrations.
W. D. H.

Absorption of Fat from Intestinal Loops in Dogs. O. H. PLANT (*Amer. J. Physiol.*, 1908, 23, 65—80).—Bile salts increase the absorption of fats from a mixture which contains free fatty acid or soap; they only slightly increase the absorption of neutral oil. Solutions of soap, or biliary solutions of fatty acids, are absorbed more rapidly than emulsified fats. If both bile and pancreatic juice are excluded from the intestinal loop, neutral oil is nevertheless absorbed, and it becomes markedly acid in reaction. Taken as a whole, the experiments favour the view that fats are absorbed in solution rather than as an emulsion.
W. D. H.

Absorption of Iodised Proteins. OTTO VON FÜRTH and M. FRIEDMANN (*Arch. exp. Path. Pharm., Suppl.*, 1908, 214—223).—An iodised protein (iodalbacid) is before absorption in the cat's intestine broken down in large measure so completely that the iodine in the intestinal wall and blood is not in combination as proteose or peptone, but only as alkali iodides.
W. D. H.

Action of Intestinal Astringents on Metabolism. KARL SPIRO (*Arch. exp. Path. Pharm., Suppl.*, 1908, 504—512).—Opium, bismuth subnitrate, and tannigen produce but little change in nitrogenous metabolism in dogs. With opium the C:N ratio in the urine goes up, this is due to a fall in the nitrogen; the nitrogen in the faeces is but little altered. Tannigen, on the other hand, causes a loss of urinary, and an increase of faecal nitrogen, the total excretion of nitrogen being about the normal; a sinking of the C:N ratio in the urine is mainly due to a relative decrease in the excretion of carbon.
W. D. H.

Creatinine Metabolism. G. LEFMANN (*Zeitsch. physiol. Chem.*, 1908, 57, 476—514).—The excretion of creatinine and creatine is

pretty constant in well nourished animals. If either substance is added to the food, it is excreted unchanged. If creatine is given by the mouth or parenterally, it is never changed into creatinine; in inanition it is almost completely excreted as such. Disease of the liver or increased protein catabolism produce first an increase, then a decrease, in creatinine excretion, and when it is lessened, the amount of creatine excreted increases. The liver is the probable seat of creatinine formation. If nephritis is induced by chromates, nearly all the creatinine is changed into creatine, probably by the alteration in the reaction of the urine.

W. D. H.

The Changes in Gaseous Metabolism after Exclusion of the Hepatic Circulation. VITTORIO SCAFFIDI (*Biochem. Zeitsch.*, 1908, 14, 156—179).—Experiments were carried out on ducks, the liver circulation being excluded by ligaturing the portal vein. As birds were employed for the experiments, it was not necessary to make an Eck fistula. The absorption of oxygen and excretion of carbon dioxide were determined both before and after the operation. It was found that the operation caused an increase in the oxygen absorption and in the carbon dioxide excretion, and also an increased respiratory quotient. These results are probably due to the inhibition of glycogen storage, owing to the liver being thrown out of circulation. There is consequently an increased destruction of the carbohydrates, which are thrown into the circulation. The increased respiratory quotient, which is particularly noticeable at some interval after the operation, is probably due to the conversion of the carbohydrate into fat.

S. B. S.

Starvation Metabolism. MIECZYSLAW HALPERN (*Biochem. Zeitsch.*, 1908, 14, 134—142).—The urine of a patient unable to ingest either food or water, owing to cancer in the oesophagus, was analysed. The total daily excretion of nitrogen was 2.058 grams, or, excluding the protein nitrogen excreted, 2.0097 grams. This is less than found in most other starvation cases, owing probably to the fact that the organism had gradually accommodated itself to a low diet. Other anomalies were also observed, for the ammonia nitrogen was only 4.7% of the total. The excretion of the acetone substances was also small. The purine substances were also small in amount, the daily excretion of purine nitrogen being only 0.05897 gram. The sodium chloride excretion was 0.05265 gram daily, whilst the ratio $N : P_2O_5$ was 6.3 : 1, which is normal and higher than in other starvation cases. The author discusses the possible reasons for the anomalies.

S. B. S.

The Nutritive Value of Protein Cleavage Products. VIII. HILF ABDERHALDEN (*Zeitsch. physiol. Chem.*, 1908, 57, 348—362. Compare this vol. ii, 961).—Dogs react differently by feeding on protein cleavage products, some being attacked with vomiting. But those which do not react in this way, equilibrium and health are well maintained. Complete details of the experiments are tabulated. The same result was obtained also with the products of acid hydrolysis.

of flesh and casein. If, however, the greatest part of the tryptophan and tyrosine was removed from the mixture beforehand, the results were not so good.

W. D. H.

Phosphorus in Certain Foods WOLFGANG HEUBNER and M. REEB (*Arch. exp. Path. Pharm., Suppl.*, 1908, 265—272).—The phosphorus-containing substances in foods fall into five groups, namely, inorganic phosphates, phosphatides, nuclein, phosphoproteins, and esters of phosphoric acid. The position of inosic acid and phosphoric acid in this classification is uncertain. A method is described for estimating these various compounds, and the results of the examination of various foods, meat, milk, bread, and other vegetable foods, are given in a table.

W. D. H.

Absorption and Assimilation of Organic Compounds of Phosphorus. PIO MARFORI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 378—388).—Natural glycerophosphoric acid differs from the synthetic substance in that its salts, when injected subcutaneously, yield, at least in part, assimilable phosphorus. The phosphorus of lecithin, and, to some extent, that of nucleo-proteins, is also assimilated under these conditions. Nuclein and nucleic acid from yeast, when given by the mouth, did not increase phosphorus assimilation.

G. B.

The Cleavage of 2:5-Diketopiperazines in the Organism of the Rabbit. II. EMIL ABDERHALDEN and LEONHARD WACKER (*Zeitsch. physiol. Chem.*, 1908, 57, 325—328. Compare this vol., ii, 521).—In the further investigation of this question, it appeared desirable to employ an anhydride which is decomposed by alkali with difficulty. The one selected was *dl*-leucylglycine anhydride, and the experiments confirm those previously reported; this substance is in small measure resolved into its components by the organism of the rabbit.

W. D. H.

The Degradation of Aromatic Substances in the Human Organism. LEON BLUM (*Arch. exp. Path. Pharm.*, 1908, 59, 273—298).—When administered to normal individuals, neither phenylalanine nor tyrosine, normal hydrolysis products of proteins, increase appreciably the aromatic contents of the urine. On the other hand, when given to alcaptonurics, they increase the homogentisic acid excretion in the urine. It has been assumed, therefore, that homogentisic acid is a normal intermediate product of metabolism of aromatic hydrolysis products of proteins, and that alcaptonuric individuals do not possess the power of completely utilising these

products, and that tyrosine in the normal individual is first converted into homogentisic acid. This change can take place in the

following ways: (a) the degradation may commence in the side-chain,

in which case *p*-hydroxyphenylacetic acid, or hydro-*p*-coumaric acid, $\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, is first formed, and subsequently converted into homogentisic acid. It was found by Baumann and Schotten that hydro-*p*-coumaric acid, when administered to normal individuals, gave rise to *p*-hydroxybenzoic acid to the extent of 13%, whereas *p*-hydroxyphenylacetic acid was recovered to the extent of 78.6% in the urine. The author found that neither of these acids, on administration to alcaptonurics, caused an increase in the homogentisic acid output.

(b) A change in the relative positions of the hydroxyl group and the side-chain may take place with the formation of *m*- or *o*-tyrosine, which, on secondary oxidation in the para-position and a degradation of the side-chain, could give rise to homogentisic acid. It was found that neither of these tyrosines, when administered to alcaptonurics, increased the homogentisic acid output, and when given to normal individuals they were excreted in the form of the corresponding hydroxyphenylacetic acids to the extent of about 30%.

(c) The side-chain may be degraded to acetic acid, with a concurrent change in the relative position to the hydroxyl group, forming *m*- or *o*-hydroxyphenylacetic acid. Homogentisic acid would be formed from such products by subsequent oxidation in the para-position. This possibility was unlikely, as neither *o*- nor *m*-tyrosine gave rise to homogentisic acid, and it was also found that *m*-hydroxyphenylacetic acid, when administered to normal individuals, was found unchanged in the urine to the extent of 80%. Neither *o*- nor *m*-acid gave rise to increased homogentisic output in alcaptonurics.

(d) The processes of degradation, change of relative positions of the hydroxyl group to the side-chain containing the acid group, and of secondary oxidation, can take place concurrently. A similar change has been observed by Bamberger, who showed that tolylhydroxyl-

amine is converted by hot dilute sulphuric acid into toluquinol. Other examples of similar action are also known, and quoted by the author. A change of this description must take place when tyrosine is converted into homogentisic acid. The results also

indicate that homogentisic acid is a normal intermediate product of metabolism, as none of the products which were not fully destroyed in the normal individual gave rise to increased homogentisic output in alcaptonurics.

m-Tyrosine was prepared by the condensation of *m*-hydroxybenzaldehyde with hippuric acid. The lactimide of *m*-hydroxybenzoylaminocinnamic acid in the form of its acetyl derivative, $\text{C}_{16}\text{H}_{13}\text{O}_5\text{N}$, m. p. 149° , was obtained. On hydrolysis with 10% sodium hydroxide solution, *m*-hydroxybenzoylaminocinnamic acid, $\text{C}_{16}\text{H}_{13}\text{O}_4\text{N}$, m. p. $205\text{--}206^\circ$, was formed, which, on reduction with sodium amalgam, yielded *m*-benzoyltyrosine, $\text{C}_{16}\text{H}_{15}\text{O}_4\text{N}$, m. p. 180° . From this, *m*-tyrosine, $\text{C}_9\text{H}_{11}\text{O}_3\text{N}$, m. p. $280\text{--}281^\circ$, was obtained by hydrolysis with 20% hydrochloric acid.

o-Tyrosine was obtained by a similar synthetic method, although all the intermediate products were not obtained pure. *o*-Benzoyltyrosine melts at 176° , and *o*-tyrosine at $249\text{--}250^\circ$.

S. B. S.

Are there Reducing Ferments in the Animal Body? ARTHUR HEFFTER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 253—260).—The reduction processes which occur in animal organs or their extracts, or in vegetable tissues, have been attributed to enzyme action. Boiling does not abolish the action; this and other considerations lead the author to the conclusion that "reductases" do not exist.

W. D. H.

Spectroscopic Properties of Yolk of Egg. LOUIS LEWIN, A. MIETHE, and E. STENGER (*Pflüger's Archiv*, 1908, 124, 585—590).—Attempts are being made to establish relationships between the colouring matters of egg-yolk and blood on account of the close morphological relationship between the blood and yolk. The first step in this direction has been the careful spectroscopic examination of the colouring matter of the yolk. The plates used for photographing the spectra were dyed with isocol. Solutions in water, acetone, alcohol, ether, chloroform, and benzene were examined. The solutions were found to follow Kundt's rule, for example, the absorption bands of the chloroform and benzene solutions were 5—10 μ nearer the red end of the spectrum than the corresponding bands of the other solutions.

There are three characteristic bands at 480, 453, and 427, and feebler bands at 400 and 378. No other yellow colouring matter gives the same absorption bands, and it is thus possible to detect adulterants of yellow of egg by spectroscopic measurements.

J. J. S.

Chemico-physical Investigations on the Crystalline Lens. FILIPPO BOTTAZZI and NOE SCALINCI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 305—316. Compare this vol., ii, 966).—The crystalline lens contains an electro-negative protein, *facoprotein*, which is only soluble in water in the form of acid protein in absence of alkali, or of alkali protein, which is soluble also in absence of salts. The essential material of the lenticular fibre is, in normal conditions, a hydrogel of liquid or gummy consistency. The results are mainly of physiological interest.

T. H. P.

Higher Fatty Acids in the Liver after Removal. JOHN B. LEATHES (*Arch. exp. Path. Pharm., Suppl.*, 1908, 327—336. Compare *Abstr.*, 1904, ii, 355).—A full account of a research previously published, with a description of further experiments on the same lines. The increase of fatty acids previously noted does not invariably occur, but no light can be at present thrown on the nature of the processes involved.

W. D. H.

The Formation of Uric Acid in the Liver of Birds. ERNST FRIEDMANN and H. MANDEL (*Arch. exp. Path. Pharm., Suppl.*, 1908, 199—207).—The experiments recorded were made by perfusing the surviving liver of the goose with various mixtures. If uric acid is added to the perfusion fluid, none is retained or destroyed by the liver. If urea and sodium lactate or malonate are added, there is no increase in uric acid formation. Uric acid formation in the bird's liver is therefore not the simple synthesis it has been considered to be.

W. D. H.

Action of Certain Gases on Autolysis. LUIGI BELLAZZI (*Zeitsch. physiol. Chem.*, 1908, 57, 389—394).—Carbon dioxide favours, and oxygen is indifferent, or feebly inhibitory, towards, autolysis of the liver. W. D. H.

Decomposition of Caffeine by Extract of Ox-Liver. Y. KOTAKE (*Zeitsch. physiol. Chem.*, 1908, 57, 378—381).—Extract of ox-liver decomposes caffeine into xanthine, hypoxanthine, *l*-methyl-xanthine, and paraxanthine. The removal of the methyl groups is prevented by boiling the extract, or by the use of such protoplasmic poisons as toluene or chloroform. The action is therefore attributed to a ferment. W. D. H.

Action of Drugs on the Mammalian Uterus. HAROLD J. FARDON (*Bio-Chem. J.*, 1908, 3, 405—411).—The investigation of a number of drugs shows that the reaction of the uterus is that of a plain muscular organ supplied by sympathetic nerves, of both inhibitory and augmentative nature. Pregnancy and nicotine alter the relative influence of the two sets of fibres. W. D. H.

Inosite [in Flesh]. FRANZ ROSENBERGER (*Zeitsch. physiol. Chem.*, 1908, 57, 464—467. Compare Abstr., 1908, ii, 873).—One factor in the presence or not of inosite, or of its precursor, inositol, in flesh appears to be the time of year, which, as is well known, also affects the quantity of glycogen. W. D. H.

Hydrolysis of Fish Muscle. THOMAS B. OSBORNE and FREDERICK W. HEYL (*Amer. J. Physiol.*, 1908, 23, 81—89).—The results are compared with those previously published in relation to chicken muscle in the following table, where the figures show percentages of cleavage products:

	Halibut muscle.	Chicken muscle.
Glycine	0.0	0.68
Alanine	?	2.28
Valine	0.79	?
Leucine	10.33	11.19
Proline	3.17	4.74
Phenylalanine	3.04	3.53
Aspartic acid.....	2.73	3.21
Glutamic acid	10.13	16.48
Serine	?	?
Tyrosine	2.39	2.16
Arginine	6.34	6.50
Histidine	0.55	0.47
Lysine	7.45	7.24
Ammonia	1.33	1.67
Tryptophan	present	present
Total	50.25	62.15

The most marked difference is seen to be in the percentage yield of glutamic acid. W. D. H.

Cholesterol in Ox-Bile. ERNST SALKOWSKI (*Zeitsch. physiol. Chem.*, 1908, 521—523).—Cholesterol can be easily prepared from the dried

bile of commerce. Previous saponification is unnecessary. The view is held that cholesterol occurs as such in bile, not as an ester.

W. D. H.

Quantitative Researches on the Exhalation of Alcohols. JULIUS POHL (*Arch. exp. Path. Pharm., Suppl.*, 1908, 427—434).—The result of the experiments recorded is that alcohols of higher boiling points (*tert.*-amyl alcohol; *isopropyl* alcohol) are exhaled with the breath to a greater degree than those of lower boiling point (ethyl alcohol; methyl alcohol). This unexpected result cannot yet be explained.

W. D. H.

The Distribution of Nitrogen amongst the Various Products in Human Urine. LOUIS C. MAILLARD (*Compt. rend.*, 1908, 147, 710—712).—The mixed urine from ten men of from 22—25 years of age was examined on six consecutive days. Of the total nitrogen excreted, 5.73% was in the form of ammonia, 81.29% in that of urea, 1.65% in that of purine compounds, 1.43% in that of uric acid, 0.22% in that of purine bases, and 11.15% in other forms of combination (creatinine, oxyproteic acids, urochrome, hippuric acid, amino-acids, etc.). The proportion of nitrogen to phosphorus was as 9:1.37. Muscular work was without appreciable influence on the total nitrogen excretion, although there was a slight diminution of urea, an undoubted increase in phosphates, and a slight increase in the nitrogen in the undetermined forms.

S. B. S.

Detection of Organic Bases in Urine. R. ENGELAND (*Zeitsch. physiol. Chem.*, 1908, 57, 49—64).—Urine has been treated by the three following methods: 1. Precipitation of the urine with a cold saturated solution of mercuric chloride and sodium acetate (compare Johnson, *Abstr.*, 1888, 506; 1889, 165). 2. Concentration of the urine and precipitation with tannin. 3. Precipitation of urine with a hot saturated solution of mercuric chloride and sodium acetate.

The bases isolated from the precipitate in the first method were creatinine and *as*-dimethylguanidine, the latter of which was obtained as the crystalline *aurichloride*, m. p. 144°.

The precipitate obtained according to the second method contained creatinine and methylguanidine, the latter of which was isolated as its *aurichloride*, m. p. 198°. It has been shown that the methyl- and dimethyl-guanidines are not produced by the action of hydrochloric acid on creatinine.

When the third method of precipitation was used, all the creatinine is removed, as the filtrate no longer gave Weyl's reaction. The bases isolated from the precipitate were creatinine, methylguanidine, vitiatine, histidine, a base, $C_{15}H_{26}O_{12}N_8$, similar to some of the protamines, and a base, $C_8H_7O_2N_3$, similar to histidine. The last base was isolated as its *picrolonate*, $C_8H_7O_2N_3 \cdot C_{10}H_8O_5N_4$, which crystallises in short needles, decomposing at 244°. The base gives a red coloration with alkali and copper sulphate, and also a dark red colour with an alkaline solution of diazobenzenesulphonic acid.

Iminazole derivatives are found in the urine of most animals, but

herbivorous animals produce larger quantities of these compounds than do the carnivora. J. J. S.

The Regular Occurrence of Indole in the Distillate of Normal Urine. MAX JAFFE (*Arch. exp. Path. Pharm., Suppl.*, 1908, 299—308).—Indole is constantly found in the urine of man and other animals examined. The methods of obtaining and identifying it are given in full, the differences in quantity in various animals noted, and the conditions in which indole derivatives occur discussed.

W. D. H.

Urinary Pigments derived from Indole. ALBERICO BENE-
DIGNI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 64—74. Compare
Abstr., 1907, ii, 980).—After subcutaneous administration, 5-methyl-
indole appears in the urine as dimethylindigotin; 2:5-dimethylindole
forms a red colouring matter, and α -naphthindole yields a reddish-
brown coloration, changing later to bluish-green. G. B.

Excretion of Urobilin in Disease. N. F. SURVEYOR (*Bio-Chem.*
J., 1908, 3, 439—448).—From an examination of 500 specimens of
urine in health and disease, the conclusion is drawn that there is no
correspondence between the amount of urobilin excreted and the
amount of ethereal sulphates in the urine. Urobilin formation is there-
fore not the result of intestinal putrefaction. Disease of the liver also
does not seem to be responsible for its appearance. The method
adopted for the estimation of urobilin is the depth of the absorption
band in an amyl-alcoholic extract of the urine, and so far as any con-
clusion can be drawn from the inconstant results found in most
diseases, it appears that conditions that lead to hæmoglobin destruc-
tion are those most likely to produce increase of the urinary
urobilin. W. D. H.

Microchemical Changes occurring in Appendicitis. OWEN T.
WILLIAMS (*Bio-Chem. J.*, 1908, 3, 391—401).—The author considers
that intestinal sand (Abstr., 1907, ii, 906) consists largely of calcium
salts (soaps) of saturated fatty acids. These soaps are not so easily
absorbed as those derived from unsaturated fatty acids.

Action of Radium Emanations [in Diabetes]. E. POULSSON
(*Arch. exp. Path. Pharm., Suppl.*, 1908, 443—448).—It is well known
that many mineral waters contain radium. Cases of diabetes were
treated with radon active water. In two severe cases, no good was
done; in a third case, where the disease was not so malignant, the
excretion of sugar was lessened, although whether this was due to the
water is uncertain. W. D. H.

The Degradation of Fatty Acids in Diabetes Mellitus.
JULIUS BAER and LEON BLUM (*Arch. exp. Path. Pharm.*, 1908, 59,
321—330).—It has been shown previously (compare Abstr., 1907, ii,
285) that isovaleric acid gives rise to β -hydroxybutyric acid in severe
cases of diabetes mellitus, and leucine acts in a similar way; no

great difference could be detected in the relative amounts excreted. Experiments were made in mild cases of the disease, and it was found that isovaleric acid exerted but little influence on the excretion of the hydroxybutyric acid; *n*-butyric and hexoic acids caused, however, an increased output. Similar results were not obtained in all the cases investigated. S. B. S.

The Influence of Muscular Work on the Excretion of Sugar in Pancreas Diabetes. Y. Seo (*Arch. exp. Path. Pharm.*, 1908, 59, 341—363).—Experiments were carried out on dogs which had been either wholly or partly deprived of the pancreas. The excretions of nitrogen and sugar were determined during periods of rest and periods of work, when the animals turned a treadmill. In animals in which the pancreas had only been partly removed, it was found that muscular work diminished the excretion of sugar. This was not the case, however, in animals on which total extirpation of the pancreas had been performed. In these cases, the ratio dextrose: nitrogen increased during the periods of work. The conclusion is drawn that increased utilisation of sugar by muscular work can only take place when some functioning pancreas tissue remains in the organism. S. B. S.

Acidosis in Pancreas Diabetes. EDUARD ALLARD (*Arch. exp. Path. Pharm.*, 1908, 59, 388—396).—Brugsch and others have maintained that acidosis is not found in cases of severe pancreas diabetes. The author cites, however, several experiments made with dogs deprived of the pancreas, in which a comparatively large output of β -hydroxybutyric acid was observed. The phenomenon of acidosis in these cases is, however, a very inconstant one, and it is suggested that it is due to secondary causes. The liver, or other parenchymatous tissue, in the advanced stages of the disease may have lost the power of degrading acetoacetic acid or acetone to simpler substances. S. B. S.

Radioactivity of Goitrogenic Springs. RÉPIN (*Compt. rend.*, 1908, 147, 703—705. Compare this vol., ii, 796).—The author has measured the radioactivity of the water of fourteen springs, a well, and several torrents situated in districts where goitre is endemic. The springs issuing from faults at the base of high mountains were all found to be radioactive, whilst surface water and torrents fed by glaciers or snow were inactive. Torrent waters when without turbidity are preferred, and the people who use them are free from goitre. A goitrous family living in a non-goitrous district was employing a radioactive well water. The prevalence of goitre in mountainous districts, and the success of distilled water in treating it, also suggests a connexion between radioactive water and the disease. The radioactivity has the character of radiothorium. R. J. C.

The Pathogenesis of Ochronosis. OSCAR GROSS and EDUARD ALLARET (*Arch. exp. Path. Pharm.*, 1908, 59, 384—387).—The colouring of cartilage in the pathological condition known as ochronosis

is due to the same anomaly in metabolism that produces alcaptonuria, namely, the production of homogentisic acid, which is not destroyed in the organism. The cartilage appears to have the property of attracting this acid and converting it into a dark pigment, producing in this way a form of arthritis, designated by the authors arthritis alcaptonurica. Almagia has shown that in cartilage soaked in solutions of sodium urate, concretions are formed similar to those found in cases of gout, and the authors show that cartilage in nearly neutral homogentisic acid solutions acquires a dark colour similar to that observed in cases of ochronosis. Other tissue does not act in this way.

S. B. S.

A Case of Chronic Pentosuria. RICCARDO LUZZATTO (*Arch. exp. Path. Pharm., Suppl.*, 1908, 366—377).—The urine of the patient (who has remained in good health for many years) contains generally 0.1% of *L*-arabinose. The amount is not affected by ingestion of large quantities of dextrose, sucrose, or starch, but is increased by galactose, by alkalis, and by intellectual work, and diminished by the ingestion of hydrochloric acid, and apparently also by excessive muscular labour. Pentosuria is therefore quite distinct from diabetes. In order to determine the reducing power of the urine, lead acetate is added, and, after filtration, ammonia; the basic lead precipitate formed carries down all the pentose, and is then redissolved in acid.

G. B.

Contents of a Cystic Tumour of the Breast. EMIL ZDAREK (*Zeitsch. physiol. Chem.*, 1908, 57, 461—463).—A complete analysis of the contents of a so-called butter-cyst of the mammary gland is given. It occurred in a woman, forty years of age, and had lasted twelve years before it was removed. It was about the size of an apple. It contained 48% of water, 38.6% of fat, 7.5% of fatty acids, 3% of coagulable protein, 1% of caseinogen, and 1.6% of ash.

W. D. H.

Action of Barium Chloride, Adrenaline, and Peptone on the Vaso-motor Apparatus. L. POPIELSKI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 435—442).—The three substances named all act on the peripheral vaso-motor mechanism. Barium chloride and adrenaline cause a rise of pressure by acting on the musculature; Witte's peptone causes a fall by acting on the nerve-endings in the vessels. The substance responsible for the activity of Witte's peptone is named *vaso-dilatin*, it is not a protein, nor is it choline, which when pure produces the opposite effect. Vaso-dilatin is also the substance which renders the blood incoagulable.

W. D. H.

Action of Certain Narcotics on Nerve. ALBRECHT BETHE (*Arch. exp. Path. Pharm., Suppl.*, 1908, 75—82).—The excitability of nerve and its reaction to the constant current (polarisation picture) go hand in hand. Solutions of chloral hydrate, ethylurethane, and henylurethane, which abolish the excitability, also abolish the normal polarisation changes. If the dose of the narcotic is insufficient to completely abolish excitability, the polarisation changes are altered in the measure. When these changes are produced, immersion in

Locke's solution causes the nerve to recover. This reversibility is least easy to obtain after chloral hydrate. W. D. H.

Pharmacological Action of Certain Lactones and the Corresponding Hydroxy-acids. CHARLES R. MARSHALL (*Arch. exp. Path. Pharm., Suppl.*, 1908, 389—394. Compare Abstr., 1906, ii, 788).—Certain tropeines containing a lactone group (Jowett and Hann, *Trans.*, 1906, 89, 357; Jowett and Pyman, *Trans.*, 1907, 91, 93), and possessing an atropine-like action, lose this action when they are converted into salts of the corresponding hydroxy-acids. After the addition of a molecular quantity of alkali hydroxide, this conversion occurs relatively slowly towards the end of the reaction, and the gradual change can be demonstrated pharmacologically. G. B.

Behaviour of Sodium Salicylate in the Organism. ALESSANDRO BALDONI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 54—63).—Sodium salicylate, when administered to dogs, is mostly excreted unchanged in the urine, but a small portion is converted into two crystalline derivatives with acid properties, both yielding a blue coloration with ferric chloride and having a strong reducing action. Of these, one, m. p. 169—170°, has the composition $C_{16}H_{16}O_8N$; the other, m. p. 187—188°, has the composition $C_{16}H_{14}O_8$. Salicylic acid, which is found in human urine after ingestion of sodium salicylate, cannot be detected in dogs' urine. G. B.

Pharmacological Significance of Twin Ethyl Groups. SIGMUND FRÄNKEL (*Arch. exp. Path. Pharm., Suppl.*, 1908, 181—187).—In order to test the hypothesis, that the hypnotic action of such drugs as veronal (diethylbarbituric acid, $CO < \begin{smallmatrix} NH \cdot CO \\ NH \cdot CO \end{smallmatrix} > C_2Et_2$) is due to two ethyl groups attached to the same carbon atom of the ring, the author has examined tetra-, penta-, and hexa-ethylphloroglucinol, and also the hexamethyl derivative. None of these substances has a hypnotic action, but they produce strychnine-like convulsions. G. B.

Pharmaco-dynamic Characters of Coumarin. ALEXANDER ELLINGER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 150—163).—The toxic action of cantharidin on the kidneys suggested the examination of other substances with a lactone structure, and coumarin was selected. In rabbits, albuminuria may occur, but only to any extent when the urine is acid. The injury to the kidneys, even in large doses, is never serious. Coumarin, however, in frogs causes deep narcosis, owing to its action on brain and cord; the centres affected include those governing cardiac inhibition and respiration, but the vaso-motor centre is not affected. In rabbits it is, in suitable doses, a harmless narcotic, and has no effect on the heart; large doses injected intravenously paralyse the respiration and produce death. In dogs, also, it is a narcotic, and usually produces vomiting. In large doses it kills them, but without the characteristic symptoms noticed in rabbits. This difference in action is probably related to a difference in

excretion in the two animals, but this part of the work is still in progress.
W. D. H.

Behaviour of Atropine in Various Animals. MAX CLOETTA (*Arch. exp. Path. Pharm., Suppl.*, 1908, 119—125).—Atropine appears to be destroyed in the brain and liver; this is most marked in the rabbit's brain, and least in the cat. This appears to be related to what is termed the "vital reaction difference" of the nervous tissues of various animals, and is not yet explicable on a chemical or physical basis.
W. D. H.

Action of Caffeine on Frogs. CARL JACOB and GOLOWINSKI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 286—298).—The relative difference in the action of caffeine on the two species of frog (*Rana esculenta* and *R. temporaria*) has been attributed to differences in the excitability of the spinal cord. The present research deals mainly with the difference between the muscles of the two species. The difference is mainly one of elasticity and extensibility, and this, as well as the different behaviour of caffeine towards them appears to depend on the sarcolemma of the muscular fibres, and the amount or character of its lipoids.
W. D. H.

The Fate of Synthetic Muscarine in the Animal Body. HERMANN FÜHNER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 208—213).—If muscarine is given subcutaneously to tortoises, it is again obtainable in the urine during the next few days in active form, and but little, if at all, altered in amount. The same is true for curarine.
W. D. H.

Poisons of Amanita Phalloides. JOHN J. ABEL and WILLIAM W. FORD (*Arch. exp. Path. Pharm., Suppl.*, 1908, 8—15. Compare Abstr., 1907, ii, 192).—Further details are given of the properties and actions of the two poisons contained in this fungus, namely, the hemolysin, which is a glucoside containing pentose, and the toxin. The hemolysin is easily destroyed by the gastric juice, so that, if taken by the stomach, it does not manifest its hemolytic properties.
W. D. H.

Action of Atoxyl on the Animal Body. J. IGERSHIMER (*Arch. exp. Path. Pharm., Suppl.*, 1908, 282—285).—Although sodium *p*-aminophenylarsinic acid may have its proper sphere of action in dealing with diseases due to protozoa (trypanosomiasis, syphilis, etc.), it should be recognised that its other name, *atoxyl*, is an illusory one, and in man it produces effects on the nervous, excretory, and alimentary system. Details are given of its toxic action on a number of dogs and cats.
W. D. H.

Action of Poisons on Enzymatic Processes. KARL G. SANTESSON (*Arch. exp. Path. Pharm., Suppl.*, 1908, 469—481).—It is suggested that the harmful influence of such poisons as hydrocyanic acid on the heart and on plant life is due to interference with intra-

cellular enzymes, the action of which forms the basis of the activity of living cells. In support of this view, experiments are recorded with muscle extract, and the action of the catalase in it was measured by the evolution of gas which occurs when mixed with hydrogen peroxide. This action is favoured by dilute alkali, hindered by dilute acid, by hydrocyanic acid, and also by manganese sulphate in decinormal solution; but in concentration $N/1000$ the development of gas is slightly increased; the favouring action of dilute solutions of manganese salts on other enzymatic processes is well known.

W. D. H.

Poisoning with Potassium Chlorate. L. RIESS (*Arch. exp. Path. Pharm., Suppl.*, 1908, 460—468).—The hæmolysis which follows poisoning with potassium chlorate is of a specially pernicious character, and differs from other cases of hæmolysis in that the corpuscles are broken up, so that irregular clumps of hæmoglobin are formed. The urinary tubules become filled with similar particles, although how they pass the renal epithelium is a difficulty; these tubules, especially in chronic cases, get filled with these particles, which blend so as to form casts of the tubules.

W. D. H.

Post-mortem Action of Corrosive Poisons in the Stomach. ERICH HARNACK and HERMANN HILDEBRANDT (*Arch. exp. Path. Pharm., Suppl.*, 1908, 246—252).—In forensic medicine, the degree of action of a caustic poison after death is sometimes raised. It is shown by experiments on cats that their destructive action on the gastric mucous membrane is more marked after death than during life. The action of potassium cyanide on the blood pigment also occurs post-mortem, but absorption of ammonia from the stomach only takes place during life.

W. D. H.

Chronic Oleic Acid Poisoning. EDWIN S. FAUST (*Arch. exp. Path. Pharm., Suppl.*, 1908, 171—175).—The idea that the anæmia in those afflicted with the tape-worm, *Bothriocephalus*, is due to oleic acid contained as a cholesterol ester in the worm acting as a hæmolytic poison, led to the present research, in which it is shown by experiments on rabbits and dogs that oleic acid administered by the mouth or subcutaneously over long periods of time does act as a hæmolytic agent in the same way as it does *in vitro*; the red corpuscles are diminished in number, and the hæmoglobin is lessened in amount.

W. D. H.

So-called Antitoxic Power of Animal Tissues towards Strychnine. PAUL PELLACANI and FOLLI (*Arch. exp. Path. Pharm., Suppl.*, 1908, 419—426).—Proofs are adduced that the tissues do not possess the power of destroying strychnine; practically the whole of it (98%) can be recovered from the tissues many hours after its introduction.

W. D. H.

Chemistry of Vegetable Physiology and Agriculture.

Estimation of the Reducing Power of Bacteria and Animal Organs. HEINRICH WICHERN (*Zeitsch. physiol. Chem.*, 1908, 57, 365—377).—An important distinction between different micro-organisms is their relative reducing powers, and most methods hitherto employed are defective from the quantitative aspect. It is, however, possible to obtain good results with certain coloured substances, the colour of which disappears on reduction; of these, methylene-blue appears to be the best. Still better results are obtained with ferric chloride and titration with titanium trichloride. This is illustrated by the experiments recorded with various bacteria. The method as applied to pieces of organs is not so useful, although fairly concordant results are obtained with extracts of organs. It is suggested that the same method might be employed for the estimation of the activity of oxydases.

W. D. H.

Bacterial Formation of Sulphates in Sewage Purification. CH. ROUCHY (*J. Pharm. Chim.*, 1908, [vi], 28, 439—444).—The opalescence or milkiness of effluents from inefficient bacterial sewage beds is due to the presence of finely-divided sulphur. In the limpid effluents from beds which are working properly, the sulphur has been entirely converted into sulphuric acid, which, reacting on the carbonates in the sewage, is converted into sulphates. This formation of sulphuric acid is, the author thinks, due to the oxidising action of special bacteria, analogous to the nitrifying organisms.

T. A. H.

Oxidation by means of Moulds. REGINALD O. HERZOG and A. MEIER (*Zeitsch. physiol. Chem.*, 1908, 57, 35—42. Compare Harden, *Trans.*, 1903, 83, 424).—Cultures of *Penicillium glaucum* were grown in dilute beer wort, and when the evolution of carbon dioxide had reached a constant value, a solution of the ammonium salt of a hydroxy-acid was added. The evolution of carbon dioxide was increased considerably, and each experiment was continued until the evolution had fallen again to the normal value for the medium. In this way, the carbon dioxide due to the decomposition of the hydroxy-acid could be calculated. The following acids were readily attacked: lactic, tartaric, malic, mandelic, β -hydroxybutyric, and in every case the amount of carbon dioxide evolved was considerably in excess of that calculated for the amount of acid destroyed.

Glycollic, citric, pyruvic, and hydroxyisobutyric acids were not affected.

The conclusion is drawn that the process is one of oxidation, but is accompanied by another unknown reaction, which also gives rise to carbon dioxide.

It has been shown that, when the organism has been destroyed by acetone or methyl alcohol, it can still decompose the hydroxy-acids, thus indicating that the reaction is due to an oxidising enzyme. The

activity of the dead cells is not so marked as that of the living, and ceases after some thirty-six hours. J. J. S.

Conversion of Cinnamic Acid into Styrene by means of Moulds. REGINALD O. HERZOG and O. RIPKE (*Zeitsch. physiol. Chem.*, 1908, 57, 43—45. Compare Oliviero, *Abstr.*, 1906, ii, 623).—Styrene is formed when *Aspergillus niger* is grown in dilute beer wort containing ammonium cinnamate (0.25% solution). The amount of hydrocarbon formed can be determined by aspirating sterilised air through the liquid, and then passing it through ten bulbs containing carbon disulphide. The styrene is weighed as its dibromide.

Attention is drawn to the importance of this type of reaction for the explanation of the formation of mineral oil deposits. J. J. S.

Transformations of the Chromogenic Matter of Grapes during Maturation. J. LABORDE (*Compt. rend.*, 1908, 147, 753—755).—It has been shown previously (this vol., ii, 774) that the colouring matter of red grapes can be artificially produced from the œnotannin of the unripe grapes. The object of the present work is to discover how the transformation is effected naturally. The tannins exist in the green pellicles in two forms: (1) soluble in strong alcohol, (2) insoluble in this solvent, the latter being the greater in amount. By determination of the amounts of these tannins in various species of red and white grapes, in varying states of maturity, by means of a colorimetric method described, it is shown that the total quantity of tannin matter diminishes, the proportion of the soluble tannin increases, and that of the insoluble tannin diminishes, during ripening. It is during this change of the insoluble into soluble tannin that the colouring matter of the red grapes appears. Colorimetric examination of the hydrochloric acid solution from the pellicles of grapes just commencing to ripen, before and after heating in an autoclave, shows that they contain untransformed œnotannin; with the ripe grapes this is not observed. The œnotannin in the wine must therefore proceed from other solid parts. The soluble tannin obtained from the pellicles of ripe white grapes gives only an insoluble, brown colouring matter when heated with 2% hydrochloric acid in an autoclave. The change in solubility of the tannin is probably due to diastatic action, and this raises the question whether it is an enzyme which transforms the œnotannin into the colouring matter of red grapes; if so, this enzyme must be absent from the white grapes. All attempts to find such an enzyme have, however, proved unsuccessful. E. H.

Carbohydrates of Coelococcus and Phytelephas. SERGIUS IVANOFF (*J. Landw.*, 1908, 56, 217—228).—Ground *Coelococcus* shavings, when hydrolysed with 6% sulphuric acid, yielded 20% of mannose; *Phytelephas macrocarpa* gave 37%. No other hexose was produced in appreciable quantity. Both substances yielded arabinose when boiled with 2—3% sulphuric acid; xylose could not be detected. Mannose was found to be present in two modifications, as hemicellulose and as mannocellulose. N. H. J. M.

Indole in Flowers. F. WEEHUIZEN (*Pharm. Weekblad*, 1908, 45, 1325—1329).—Indole can be detected in the white flowers of *Murraya exotica* by the action of vanillin or *p*-dimethylaminobenzaldehyde on the alcoholic extract in presence of concentrated hydrochloric acid. Each reagent produces a red coloration, that with *p*-dimethylaminobenzaldehyde being more intense in presence of sodium nitrite. Since phloroglucinol answers to the same test when it is present, the vapour exhaled from the flowers should be allowed to come into contact with the reagents.

A. J. W.

Abnormal Biochemical Products of the Rue Anemone. FREDERICK S. BEATTIE (*Amer. Chem. J.*, 1908, 40, 415—428).—Fasciated specimens of rue anemone (*Syndesmon thalictroides*) contain about 20% of methyl and ethyl isocarbostyryl-3-carboxylates and 3-methylquinoline-4-carboxylic acid. These substances are not found in the normal plant.

J. C. C.

Preparation of Pure Chitin from Boletus edulis. EMIL SCHOLL (*Monatsh.*, 1908, 29, 1023—1036).—The membranes of *Boletus edulis* consist chiefly of chitin in loose combination with carbohydrates. It has been found possible to prepare pure chitin from this fungus to the extent of 5 to 6% of the dried plant by alternate treatment with boiling water and boiling 10% aqueous potassium hydroxide. The chitin so obtained is chemically identical with animal chitin, and is, unlike Winterstein's fungus-cellulose (*Abstr.*, 1896, ii, 210), completely insoluble in concentrated alkalis. It yields about 78% of crystalline glucosamine hydrochloride when hydrolysed with hydrochloric acid.

W. H. G.

Peptolytic Ferments in Germinating and Ungerminated Seeds of Various Plants. EMIL AEDERHALDEN and DAMMHAHN (*Zeitsch. physiol. Chem.*, 1908, 57, 332—338).—The existence of peptolytic enzymes in plants has been established by the work of Schulze and Winterstein. Schittenhelm found also peptolytic ferments in seeds, and this observation is confirmed; extracts of the seeds of wheat, maize, barley, and lupins produce splitting of glycyl-*L*-tyrosine if the seeds have germinated. In the resting stage, peptolytic ferments are absent.

W. D. H.

Assimilation and Elimination of Nutrients by Oats at Different Periods of Vegetation. L. SEIDLER and ALBERT STUTZER (*J. Landw.*, 1908, 56, 273—278).—Pot experiments with oats in two different soils (a heavy loam mixed with gravel and a chalky gravel mixed with peat), manured with superphosphate and sodium nitrate and with varying amounts of potassium chloride. The plants were analysed (1) four weeks after sowing the seed, (2) when the ears began to form, (3) at the period of full flower, and (4) when the ripening was complete.

As regards nitrogen, it was found that from 50 to 60% of the total amount assimilated was taken up in the first four weeks, and that the ripe plants contained from 6 to 26% less nitrogen than at the third

period. The highest amounts of potassium were also found in the third period, the losses during ripening increasing, with some exceptions, with the amount of potassium chloride applied.

Sodium, calcium, and phosphoric acid seem to be retained by the plants to the end; slight losses of calcium occasionally took place between the third and fourth periods.

N. H. J. M.

Influence of Different Manurial Conditions on the Assimilation of Nutrients and the Structure of Plants. MAX WAGNER (*Landw. Versuchs-Stat.*, 1908, 69, 161—233).—Two series of pot experiments in which mustard, buckwheat, barley, and oats were grown under different manurial conditions. In the second series, plants were taken up and analysed at four periods of growth (May 9 and 29, June 25 and July 13).

As regards the final amount of growth above ground, both the oats and the barley, which ripened completely, generally showed a loss, especially when insufficiently manured. Deficiency of nutrients, especially nitrogen, resulted in a higher relation of roots to above ground growth.

A deficiency of phosphoric acid in soil otherwise sufficiently manured reduced the yield of barley most, then oats, buckwheat, and mustard. When potassium was deficient, barley again suffered most, then oats and mustard, and lastly buckwheat.

Whilst the buckwheat, which remained green to the fourth period, continued to take up the different nutrients to the end, the oats, barley, and mustard showed losses of nitrogen, potassium, and phosphoric acid at the final period.

The relation of grain to straw was considerably affected by the conditions of manuring. In the case of barley, a low relation of grain was most marked when potassium was deficient, whilst with oats, deficiency of nitrogen caused the greatest reduction.

N. H. J. M.

Amount of Nutrients Utilised by Sugar-Beet in the First Year and its Relation to the Amount of Sugar in the Roots. KARL ANDERLIK and JOSEF URBAN (*Zeitsch. Zuckerind. Böhm.*, 1908, 33, 83—94. Compare *ibid.*, 1906, 31, 149; 1907, 32, 559).—The amount of phosphoric acid assimilated by sugar-beet depends on the manuring and the amount present in the soil, on the rainfall, and on the seed. With a yield of 400 quintals of roots, the amount of phosphoric acid taken up under normal conditions varied from 51.7 to 87.8 kilos., whilst in a dry season the average amount was 48.6 kilos.

The amount of phosphoric acid required to produce 100 parts of sugar also varies according to manurial and climatic conditions. The results of various experiments made from 1902 to 1905 showed that the average amount is 0.97 part of P_2O_5 , the amount deposited in the roots being 48.4% of the total.

N. H. J. M.

Digestibility of Hay from Water Meadows as Compared with Ordinary Hay. KONRAD FRIEDLÄNDER (*Landw. Versuchs-Stat.*, 1908, 69, 245—258).—The hay from water meadows is characterised

by a high percentage of mineral matters and a very high percentage of crude protein. The results of feeding experiments with sheep showed that the digestibility of the crude protein is distinctly higher, and of the true protein appreciably higher, than in the case of ordinary hay. The latter contains, however, a higher amount of carbohydrates.

N. H. J. M.

Studies on the Soils of the Northern Portion of the Great Plains Region: Nitrogen and Humus. FREDERICK J. ALWAY and ROBERT S. TRUMBULL (*Amer. Chem. J.*, 1908, 40, 147—149. Compare Abstr., 1907, ii, 294).—Determinations of total nitrogen, soluble humus, and the nitrogen in the soluble humus in nineteen comparatively heavy soils and one sandy soil from Saskatchewan and Alberta. The percentages of total nitrogen are fairly high in all the soils except the sand, whilst the humus is rather low, although much higher than in the arid soils of California. The proportion of the total nitrogen present in the form of humus is decidedly low. The percentage of nitrogen in the humus is not markedly different from that of soils from humid regions.

The results seem to indicate that the surface soils of the semi-arid portions of Western Canada have the characteristics of humid regions, whilst the sub-soils show the peculiarities of other arid regions.

N. H. J. M.

Isolation of Dihydroxystearic Acid from Soils. OSWALD SCHREINER and EDMUND C. SHOREY (*J. Amer. Chem. Soc.*, 1908, 30, 1599—1607. Compare this vol., ii, 889).—Four out of six more or less unfertile soils were found to contain dihydroxystearic acid, identical with the one obtained from elaidic acid (Saytzeff, Abstr., 1886, 140). The soil which yielded most of the substance was a grey silt loam from Tennessee, which had been under cultivation for more than fifteen years chiefly in cotton. The soil contains organic matter 3.26, and nitrogen 0.16%. The amount of fairly pure substance obtained from 1 kilo. of soil was about 0.05 gram; the amount actually present is probably far greater.

As regards the toxicity of dihydroxystearic acid, experiments with wheat seedlings show that as little as 20 parts per million is distinctly injurious; 100 parts per million reduced the weight to 53%, whilst 200 parts per million (approximately a saturated solution) had about the same effect. Practically the same results were obtained with dihydroxystearic acid, prepared from elaidic acid, and with the isomeric acid from oleic acid, the weight being reduced to about half of that in the control experiment, and the plants being killed in twelve to fifteen days.

The Takoma soil previously examined (*loc. cit.*), which also contains dihydroxystearic acid, seems to be a good medium for fungi. Rootlets of oak trees growing in the soil were found to be infested with mould, and when freed from soil yielded small quantities of the acid. The conclusion is drawn that the dihydroxystearic acid is produced by the moulds, perhaps by the decomposition of lecithins

into oleic acid, conversion of oleic acid by nitrous acid into elaidic acid, and oxidation of the latter by enzymes or micro-organisms.

N. H. J. M.

Ammonia Question. PAUL EHRENBURG (*Landw. Versuchs-Stat.* 1908, 69, 259—294. Compare this vol., ii, 60).—Experiments on the production of basic and acid reactions in peaty soil, by application of nitrogen in the form of potassium or sodium nitrate and ammonium salt respectively, and on the effect of the reactions on different plants. Experiments were also made in which ammonium sulphate was applied both with and without calcium carbonate.

As an example of the effect of the two forms of nitrogen (in absence of calcium carbonate) on the growth of plants in an acid soil, it is shown that maize, sorghum, barley, and white mustard during the first periods of growth cause the acidity of the soil to be neutralised when manured with nitrate, and then produce normal growth. At the same time, the assimilation of potassium and other bases tends to maintain the change of reaction within certain limits. The same plants, manured with ammonium sulphate, were able, with the exception of mustard, to make a start under the conditions of slight soil acidity, but after reaching a certain point fell off, owing to the increased acidity resulting from the sulphuric acid of the ammonium salt. Mustard is the most sensitive to ammonium salts, and maize the least sensitive, owing probably to the greater amount of soil it produces.

N. H. J. M.

Old and New Nitrogenous Fertilisers: Calcium Cyanamide, Calcium Nitrate, Ammonia Sulphate, and Sodium Nitrate. VITTORIO NAZARI (*Atti R. Accad. Lincei*, 1908, [v], 17, ii, 334—342).—The author has investigated the influence of various factors on the fertilising value of calcium cyanamide, and has carried out experiments on the comparative values of calcium cyanamide, calcium nitrate, ammonium sulphate, and sodium nitrate as fertilisers. The crop used, in all cases, was wheat.

The results show that the value of calcium cyanamide is greatly enhanced by the presence in the soil of organic matter in the form of stable manure. The cyanamide acts most beneficially at about 20 cm. below the surface of the soil, and at a depth of 5 cm. gives much less favourable results than at a depth of 35 cm. The best fertiliser to use in association with calcium cyanamide is bone superphosphate, partly owing to the fact that it contains a certain proportion of readily fermentable matter, which serves to nourish the micro-organisms; also, admixture of the cyanamide with gypsum gives better results than admixture with lime, owing to the action of the calcium sulphate on the soil constituents containing insoluble potassium compounds, and to its stimulating action on many of the lower forms of plant life. On treating the soil with equal amounts of nitrogen in the form of the various fertilisers, the best and approximately identical results were obtained with calcium nitrate, ammonium sulphate, and sodium nitrate, calcium cyanamide yielding a considerably inferior crop.

T. H. P.

Danger of Employing Salts of Arsenic in Agriculture. W. MESTREZAT (*J. Pharm. Chim.*, 1908, [vi], 28, 393—397).—Wines manufactured from untreated vines are found to contain 0.000005 to 0.000008 gram of arsenic per litre, whilst those from vines which have been cultivated on the same soil and in the same manner as the preceding, except that they have been treated three times with various arsenical preparations (as insecticides), contain 0.000020 to 0.000025 gram of arsenic per litre. The danger from this cause is accordingly negligible. Inappreciable quantities of arsenic are found to be inhaled by workmen who have to prepare the arsenic salts for use, whilst the quantities settling on their hands and faces (0.0007 to 0.0012 gram) are probably innocuous. E. H.

Analytical Chemistry.

New Burette Clamp. GUSTAV MÜLLER (*Zeitsch. angew. Chem.*, 1908, 21, 2318—2319).—To a retort stand with a tripod base are fixed one or more clamps so constructed that they may be moved and turned both horizontally and vertically. Hence it is immaterial whether the stand is perfectly level, for the burettes may be always properly adjusted.

A retort stand with the rod fixed in the centre of the oblong base may also be used; the rod should consist of two parts, which may be unscrewed if desired. The base is provided with a hole, so that it may be attached to the wall; the clamps are then fixed to the protruding rod. From the rod may be suspended a variety of laboratory sundries, such as towels, brushes, etc., so as to economise space.

L. DE K.

Rapid Method of Qualitative Analysis. W. BRANCH POLLARD (*Chem. News*, 1908, 98, 211).—One part of the finely-powdered substance is mixed with 1 part of vaseline and 5 parts of sodium peroxide. The mixture is placed on a thick iron plate, or in the cavity of a scorifying mould, and ignited by means of a match or a Bunsen burner. The fused mass is extracted with water, and both the soluble and insoluble matter tested as usual. The soluble portion contains, in the highest state of oxidation, those elements which form soluble sodium salts; the insoluble portion contains the oxides and carbonates of the other metallic elements.

A special test should be made for mercury and sodium. The method is more particularly suited for examining ores and minerals in the field.

L. DE K.

Detection of Hydrogen Peroxide in Milk. W. PERCY WILKINSON and ERNST R. C. PETERS (*Zeitsch. Natur. Genussm.*, 1908, 16, 515—517).—The reaction described by Feder (*Abstr.*, 1908, ii, 318) is shown by

the authors' experiments to depend on the actual quantities of hydrogen peroxide and formaldehyde present, and also on the proportion of these two substances to each other. The strongest reaction is obtained when from 0.004 to 0.013% of formaldehyde and about 0.005% of hydrogen peroxide are present in the milk. If the amount of hydrogen peroxide is increased to 0.5%, a coloration is not obtained. Ferric salts, nitrates, etc., also influence the reaction, so that a positive reaction is not a definite proof of the presence of hydrogen peroxide. The test proposed by the authors (Abstr., 1908, ii, 907) for distinguishing between raw and heated milk may be applied conversely to the detection of hydrogen peroxide; it is not affected by the presence of nitrates or ferric salts.

W. P. S.

Pringsheim's Method for Estimating Chlorine, Bromine, and Iodine in Organic Compounds. ERIK J. VIRGIN (*Arkiv Kem. Min. Geol.*, 1908, 3, No. 12, 1—6).—The author has investigated the method proposed by Pringsheim (compare Abstr., 1904, ii, 146, 447; 1905, ii, 609) for estimating halogens in organic compounds by means of sodium peroxide.

With 1:4-dichloronaphthalene tetrachloride, 3:4-dichlorophenol, and *p*-bromoaniline, this method gives low results, whilst with *p*-dibromobenzene and iodoform good results are obtained.

The method is only applicable to substances which burn quietly with the sodium peroxide, and give no smoke or flame outside the crucible. As it is impossible to tell beforehand if this will be the case, and as there is no definite limit between quiet and vigorous combustion, the method is not to be recommended.

T. H. P.

Kjeldahl's Method. ERNST SALKOWSKI (*Zeitsch. physiol. Chem.*, 1908, 57, 523—526).—Some practical details in the employment of this method are given as the result of the author's experience. Among other points, the omission of the addition of mercuric oxide is recommended.

W. D. H.

Micro-chemical Reactions of Arsenic Applicable to Medico-Legal Investigations. GEORGES DENIGÈS (*Compt. rend.*, 1908, 147, 596—597).—A description of the technique is given for identifying arsenic by microscopical methods, the reagents employed being silver nitrate in solutions acidified by acetic acid, and in ammoniacal solutions. The reactions are carried out with a drop of arsenical liquid, which has been evaporated to dryness with certain precautions, on an object glass.

S. B. S.

Mercurous Nitrate as a Microchemical Reagent for Arsenic. GEORGES DENIGÈS (*Compt. rend.*, 1908, 147, 744—745. Compare preceding abstract).—The reagent is prepared by triturating crystallised mercurous nitrate (10 grams) with nitric acid (D 1.39, 10 c.c.) and adding water (100 c.c.). A small drop of the solution (in nitric acid) to be tested is evaporated to dryness on a glass plate by a gentle heat, and the residue treated with a drop of ammonia, which is also evaporated. To the residue, when quite cold, a drop of the mercurous reagent of a volume insufficient to completely cover it is added.

After two minutes, the drop of reagent is spread over the entire residue by means of a very finely-pointed glass rod, care being taken not to scratch the glass and to keep the rod in a continuous circular motion for 20—30 turns. After another two minutes, if arsenic is present, examination under the microscope (magnifying 40—50 or 100 diameters) reveals thick macles and crystallites, often arranged in a double fan-shape and coloured brownish-yellow, and groups of almost colourless tablets with rounded ends. When the residue is very small, only an extremely small drop (not more than 1—2 mm. diameter) must be used. The test can only be effected successfully by the exact attention to all the above details.

E. H. *

Simplified Apparatus for the Estimation of Carbon in Iron. THEO. GRAZESCHUK (*Chem. Zeit.*, 1908, 32, 1092).—An improvement of the apparatus generally used. Close to the end of the inner tube of the condensing arrangement is sealed a concave disk, on which is placed the sample, and when the condenser is placed in the flask the disk should dip slightly into the chromic acid mixture. After transmitting a current of purified air and connecting the apparatus with the train of absorbers, heat is applied with a small flame, and, owing to the disc, a more even distribution of heat is effected. Instead of using a breakable glass tube for connecting the condenser with the water supply, an indiarubber tube is substituted. The distance between the condenser and flask is about 2 mm. The acid rises to a considerable height in the tube, but there is no danger of loss.

L. DE K.

A Boat Funnel. H. STOLTZENBERG (*Zeitsch. angew. Chem.*, 1908, 21, 2271).—To facilitate filling the boat used for combustions, the author describes a nickel funnel made the shape and length of the boat and having a narrow slit underneath. This funnel is supported over the boat, which stands on a small nickel tray, and it allows of the substance being evenly distributed along the boat in an expeditious manner; if overfilled, the substance may be collected from the nickel tray.

J. V. E.

Apparatus for the Estimation of Carbon Dioxide, etc. M. EMMANUEL POZZI-ESCOT (*Bull. Assoc. chim. Sucr. Dist.*, 1908, 26, 267—271).—The piece of apparatus described consists of a flat-bottomed flask provided with a hollow glass stopper, through the centre of which is fused the stem of a tapped funnel; the latter serves as a reservoir for the dilute acid, or other reagent, used in the estimation. A narrow glass tube extends from the stopper of the bottle to the top of the funnel, and a second tube leading from the stopper serves as the delivery tube of the apparatus. The top of the funnel is closed by means of a stopper provided with a small hole, which, on turning the stopper, is brought opposite a similar hole in the neck, so that the pressure in the flask may be equalised when necessary. The apparatus may be used for the estimation of carbon dioxide in carbonates, nitrogen in urea and ammonia (by using the sodium hypobromite method), and in the analysis of hydrogen peroxide, persulphates, etc.

W. P. S.

Separation of the Alkali Metals in the Electrolytic Way. JACOB S. GOLDBAUM and EDGAR F. SMITH (*J. Amer. Chem. Soc.*, 1908, 30, 1705—1711).—In earlier papers (Abstr., 1907, ii, 574, 988), it has been shown that halide salts of various metals, and particularly those of the alkalis and alkaline earths, can be readily analysed electrolytically with the aid of a mercury cathode and a rotating silver anode. Results are now recorded which have been obtained with ammonium chloride, bromide, and thiocyanate, and the chlorides of caesium, rubidium, lithium, and which prove the accuracy of the method.

* An account is given of experiments on the separation of the alkali metals. Freudenberg (Abstr., 1893, ii, 506) has shown that trustworthy separations of metals may be obtained by arranging the pressure so that it exceeds the polarisation value of one metal and continues below that of the other. Working on this principle, separations of sodium from potassium, ammonium, caesium, rubidium, and lithium, of potassium from rubidium, caesium, and lithium, of caesium from rubidium, and of lithium from rubidium and caesium, have been successfully effected. The decomposition values of potassium and ammonium salts are so near to one another that these elements could not be separated.

It is suggested that this method of separation may prove useful in the estimation of small quantities of the alkali metals which occur in silicates. E. G.

Volumetric Alkalimetric Method for Determining Alkaline Earths in Manures and Soils. OTTO FOERSTER (*Landw. Versuchs-Stat.*, 1908, 69, 235—243).—The substance (4—5 grams of quicklime or 8—10 grams of carbonate) is heated with *N*-hydrochloric acid (200—250 c.c.) in a 400 or 500 c.c. measuring flask for half an hour, then filled to the mark, and the whole filtered. A portion of the filtrate (100 c.c.), after adding the indicator, is treated with *N*/2 sodium hydroxide until the colour changes, then with 1—2 c.c. of *N*/2 acid, and boiled for a few minutes. When there is no, or only slight, precipitation of sesquioxides, the solution may be at once titrated back with *N*/2 alkali, and the number of c.c. used added to the number previously obtained. It is, however, usually advisable to dilute the cooled solution to 200 c.c. with water free from carbon dioxide and, after filtering, to titrate 100 c.c.

The approximate neutralisation of the acid solution is very desirable, as in this way most of the sesquioxides are separated. There must, however, always be an excess of acid so as to avoid the precipitation of calcium hydroxide.

It is pointed out that calcium silicates, owing to the readiness with which they are decomposed, are practically basic compounds. Calcium, in the form of hydrated silicate (or even after being ignited for half an hour), can be determined by the above method. N. H. J. M.

Volhard's Copper Titration. OTTO KUHN (*Chem. Zeit.*, 1908, 32, 1056—1057).—The author agrees with Theodor (this vol., ii, 898) that Volhard's process gives very satisfactory results. He has, however,

introduced a slight modification so as to avoid the harmful influence of free nitric acid, which has a solvent action on the copper thiocyanate precipitate.

The solution of the alloy in nitric acid is mixed with ammonia until a permanent precipitate has formed, which is then redissolved by adding a decided excess of sulphurous acid; the solution is then heated to boiling, and precipitated with ammonium thiocyanate, the excess of which is estimated in the filtrate with silver solution as usual. The nitric acid may, of course, be expelled completely by evaporating with sulphuric acid, but this would render the course somewhat more complicated.

L. DE K.

Volumetric Estimation of Mercury by means of the Thiocyanate, Iodometric, and Acidimetric Processes. ERWIN RUPP (*Chem. Zeit.*, 1908, 32, 1077—1079).—*Thiocyanate Process.*—The solution, which must contain the mercury as mercuric nitrate or sulphate and be absolutely free from mercurous nitrate, also from chlorine and nitrous acid, is titrated with $N/10$ ammonium thiocyanate, using 2 c.c. of 10% iron-alum solution as indicator; 1 c.c. of thiocyanate = 0.01 gram of mercury. When the solution has been prepared by dissolving mercury in nitric acid, the oxidation is conveniently completed with potassium permanganate, the excess of which is then removed with a pinch of ferrous sulphate.

Iodometric Process.—Twenty-five to fifty c.c. of the solution, containing about 0.1—0.25 gram of the salt, are mixed in a stoppered flask with 1—2 grams of potassium iodide, 10—20 c.c. of 10% potassium hydroxide are added, and then 3 c.c. of 40% formaldehyde diluted with 10 c.c. of water. After shaking for two minutes, 10 c.c. of glacial acetic acid are added, and then 25 c.c. of $N/10$ iodine. When all traces of metallic mercury have disappeared, the excess of iodine is titrated with $N/10$ thiosulphate; no indicator is wanted. One c.c. of iodine solution = 0.01 gram of mercury.

Acidimetric Process.—This is based on the strong affinity of mercury for cyanogen. The mercury should be present as chloride, which may be effected, if necessary, by addition of 1 gram of potassium chloride; any free acid is carefully neutralised with potassium hydroxide, using phenolphthalein as indicator, and 20 c.c. of $N/2$ potassium cyanide are added. The excess of cyanide is then titrated with $N/2$ hydrochloric acid, using methyl-orange as indicator; 2 mols of cyanide = 1 at. of mercury. The titration may also be performed by simply adding the cyanide solution until the liquid turns pink.

Notwithstanding the great stability of the cyanide, it is completely decomposed by potassium iodide with formation of potassium cyanide, which may then be titrated with $N/2$ hydrochloric acid. Mercuric oxide may also be titrated with acid in presence of potassium iodide, from which it liberates the hydroxide. Instead of standardising the cyanide with $N/2$ acid, it may be also checked against a solution of mercuric chloride of known strength.

L. DE K.

Volumetric Estimation of Mercuric Oxide. ERWIN RUPP and W. F. SCHIRMER (*Pharm. Zeit.*, 1908, 53, 928).—Mercuric oxide

cannot be estimated by dissolving in hydrochloric acid and titrating the excess of this with alkali; but it may be titrated by dissolving about 0.25 gram in 10–20 c.c. of water containing 2–3 grams of potassium iodide, and titrating with *N*/10 hydrochloric acid, using methyl-orange as indicator. Heating on the water-bath promotes the solution of the oxide.

Another plan is to boil 0.25 gram of the oxide with 50 c.c. of water and 2 grams of mercuric cyanide. When all is dissolved, 1 gram of salt is added, and when cold the solution is titrated with *N*/10 hydrochloric acid, using methyl-orange as indicator.

The process may be employed for the testing of ointments. Two grams of the sample are boiled with 2 grams of mercuric cyanide and 50 c.c. of water until all the oxide has dissolved, 1 gram of salt is added, and the solution titrated with *N*/10 acid. On account of a slight saponification taking place, owing to the liberation of potassium hydroxide, the potassium iodide process is unsuitable for the testing of fatty ointments.

L. DE K.

Estimation of Manganese by means of Potassium Ferri-cyanide. HERMANN BOLLENBACH and E. LUCHMANN (*Chem. Zeit.*, 1908, 32, 1101–1102, 1114–1115).—The solution, which must be free from metals precipitable by hydrogen sulphide, and also from ferrous iron, cobalt, nickel, chromium, and reducing substances, is mixed with an excess of potassium ferricyanide. A decided excess of aqueous sodium hydroxide is added, and the manganese dioxide is collected and washed with hot water. The filtrate is acidified with excess of dilute sulphuric acid, and the potassium ferrocyanide formed in the reaction titrated with permanganate as usual. Two mols. of ferrocyanide = 1 at. of manganese.

In presence of ferrous iron, an aliquot part of the solution should be titrated with permanganate, and an allowance should be made.

L. DE K.

New Method of Attacking Ferro-compounds, particularly Ferro-silicon. PAUL NICOLARDOT (*Compt. rend.*, 1908, 147, 676–678).—In decomposing ferro-silicon by chlorine at a red heat, it is impossible to retain all the silicon chloride. The author finds that ferro-silicon is completely decomposed by heating with commercial sulphur chloride at 70° for three minutes. Ferro-titanium is somewhat less easily decomposed, whilst ferro-chromium requires a temperature above 120°. The process is carried out in a 250 c.c. flask, closed by a small graduated dropping funnel of special shape. The apparatus is evacuated, and exactly 2 c.c. of sulphur chloride cautiously introduced. On completion of the action which is started by heating, a few drops of ammonia solution are introduced, and the flask is filled up with water as it gradually cools. The products are estimated in the usual way.

R. J. C.

Separation of Tungstic Acid from Silica. PAUL NICOLARDOT (*Compt. rend.*, 1908, 147, 795–797).—This separation is most readily effected by heating the mixture at 500° in a current of air charged

with chloroform vapour, which, unlike carbon tetrachloride, does not give a deposit of carbon at this temperature. The tungsten is thus removed as a mixture of oxychlorides.

W. O. W.

Reduction of Stannic Oxide. DAVID B. DOTT (*Pharm. J.*, 1908, 81, 585).—When stannic oxide (0.15 gram) is heated with hypophosphorous acid (0.5 gram) over a Bunsen flame during thirty minutes, it is converted into stannous phosphate or pyrophosphate, which is readily soluble in warm hydrochloric acid. Silica remains unaffected by this treatment, and, if present, can be filtered from the hydrochloric acid solution of the tin.

T. A. H.

Physico-chemical Analysis of Mineral Water. ERNST HINTZ and LEO GRÜNHUT (*Zeitsch. angew. Chem.*, 1908, 21, 2359—2368. Compare *ibid.*, 1903, 16, 842).—A mathematical paper comprising a reply to Roloff's criticism of the formulæ used by the authors for calculating the middle dissociation value from the specific conductivity. The formulæ used by Roloff are deduced and shown to be only applicable in special cases, and a complete derivation of the authors' formula is given for the first time. Roloff's assumptions respecting the calculation of the freezing point are discussed, and examples given showing an error of +5.8% from the observed values when use is made of his mode of calculation.

J. V. E.

Assay of Turpentine and Estimation of Mineral Oil in Rosin Spirit. R. ADAN (*Bull. Soc. chim. Belg.*, 1908, 22, 389—396).—Herzfeld's sulphuric acid process is quite untrustworthy for the detection of petroleum products in turpentine or rosin spirit, but Burton's nitric acid method gives satisfactory results provided the temperature is lowered to -10° . Some samples, although pure, may still give 1—2% of insoluble oils.

Petroleum in turpentine or rosin spirit may also be detected by collecting the distillate passing over between 120° — 150° . In the absence of petroleum, the fraction is miscible in all proportions with aniline or acetic anhydride.

Pure turpentine should practically distil over at 162° . In the case of rosin spirit, the bulk of the distillate collects between 165° — 175° , and the distillation is not quite finished even at 180° . This fact facilitates its detection in mixtures. It may be also identified by Grimaldi's test with tin and hydrochloric acid, which gives a green coloration, and also by its odour.

L. DE K.

Estimation of Essential Oils in Spices. R. REICH (*Zeitsch. Nahr. Genussm.*, 1908, 13, 497—509).—The method described by Mann (*Abstr.*, 1902, ii, 432) gives trustworthy results if the point at which the solvent has been removed completely can be exactly determined, and for this purpose the author recommends the following modification as giving the best result. The solution of the ethereal oil in ether, or pentane, is placed in the evaporation flask, and the solvent is evaporated almost completely. A few drops of isopropyl

chloride are then added to the flask, and the drying is continued until the current of air and other gases issuing from the platinum jet no longer gives a green flame when allowed to impinge against a heated copper gauze. The method is trustworthy for estimations of essential oils of cinnamon, cassia, cloves, peppermint, aniseed, thyme, ginger, and camphor, but cannot be used in the case of oils of carraway, lemon, eucalyptus, and turpentine, as these contain extremely volatile substances.

W. P. S.

Detection of Small Quantities of Methyl Alcohol in the Presence of Ethyl Alcohol. LEONHARDT E. HINKEL (*Analyst*, 1908, 33, 417—419).—The following method, in which the alcohols are oxidised to their corresponding aldehydes, and the formaldehyde then detected by means of morphine hydrochloride, is stated to be capable of detecting the presence of methyl alcohol in ethyl alcohol when the proportion of the former alcohol is not less than 5%. One c.c. of the mixed alcohols is placed in a small distilling flask, and the oxidising agent is added. If ammonium persulphate is used, 0.8 gram of the salt is added, followed by 3 c.c. of dilute sulphuric acid (1:5); or in the case of potassium dichromate, 1.5 grams of the salt and 1.5 grams of pure sulphuric acid are employed. In both cases, the mixture is diluted with water to 20 c.c. and distilled, the distillate being collected in test-tubes in five separate portions of 2 c.c. each. The first two portions, which will contain all the acetaldehyde, are rejected; to each of the remaining portions are added a few drops of 0.5% morphine hydrochloride solution, and concentrated sulphuric acid is run into each tube so as to form a layer at the bottom. In the presence of formaldehyde (resulting from the oxidation of the methyl alcohol), a violet ring will be formed at the junction of the two liquids. Pure ethyl alcohol always yields a trace of formaldehyde on oxidation, but the reaction obtained when 5% of methyl alcohol is present cannot be confused with the coloration due to the ethyl alcohol.

W. P. S.

Apparatus for Polarising at 87°. ALBERT P. SY (*J. Amer. Chem. Soc.*, 1908, 30, 1790—1791).—Apparatus is described for determining the rotatory power of sugar solutions at 87°. It consists essentially of a jacketed polariscope tube heated by means of a current of water from an instantaneous water heater. For details, the description and diagram in the original must be consulted.

E. G.

Influence of Clarification with Lead Acetate on the Estimation of Invert Sugar. O. SCHREFELD (*Zeitsch. Ver. deut. Zuckerind.*, 1908, 634, 947—956).—It has been shown by Prinseer-Geerligs (this vol., ii, 991) and others that, under certain conditions, laevulose and, in less degree, dextrose are partly precipitated from their aqueous solutions by basic lead acetate. The author has carried out experiments to ascertain whether the use of this reagent for clarifying solutions of commercial sugar products interferes with the estimation of invert sugar by the reduction of Fehling's solution.

The results show that the reducing power of invert sugar may be lowered by basic lead acetate, this being especially the case with low products and with high contents of invert sugar. When neutral lead acetate is employed, there is, however, little danger of low results being obtained.

T. H. P.

Optically Active Non-saccharine Substances in Sugar Beet which are Eliminated by the Action of Lime in the Purification of the Sap, and their Polarimetric Estimation. FRANZ HERLES (*Zeitsch. Zuckerind. Böhm.*, 1908, 33, 94—98).—Polarimetric determinations in beet juice before and after boiling with lime generally resulted in lower figures after treatment with lime. The differences varied between 0.0% and 0.4%. Beet juice therefore contains, as a rule, some optically active non-sugar which is either precipitated or destroyed by the lime employed during the process of purification.

N. H. J. M.

Colour Reactions of the Carbohydrates Based on the Formation of Furfuraldehyde from them. Reactions with Indole and Carbazole. C. FLEIG (*J. Pharm. Chim.*, 1908, [vi], 28, 385—392).—When 0.5 c.c. of a dilute solution of sucrose or other carbohydrate (many proteins also react) is treated with 3—4 c.c. of pure hydrochloric acid, the mixture boiled momentarily (if any coloration is thereby produced the carbohydrate solution should be diluted and less of it used), and 3—4 drops of a 0.1% alcoholic solution of indole added, a yellow-orange or reddish-orange coloration is produced. One to two drops of a 0.01% solution of sucrose diluted to 0.5 c.c. will give this reaction. Most of the sugars, starches, dextrins, glucosides, etc., react, but the polybasic alcohols, sorbitol, dulcitol, etc., are inactive. If sulphuric acid is used in place of hydrochloric acid, a blank experiment containing no carbohydrate must be made for comparison. The reaction with carbazole (which is given by the same substances as give the indole reaction) is obtained by adding 1—2 drops of a saturated alcoholic solution of carbazole and 1 c.c. of pure sulphuric acid to 0.5 c.c. of the carbohydrate solution, when a reddish-violet ring is formed at the junction of the two liquids. A blank experiment is necessary also in this case, since at certain temperatures carbazole and sulphuric acid react, giving red or violet colorations.

E. H.

Polarimetric Estimation of Starch. CARL J. LINTNER (*Zeitsch. Nahr. Genussm.*, 1908, 16, 509—512).—Sulphuric acid may be used in place of hydrochloric acid in the method described previously by the author (*Abstr.*, 1907, ii, 823). 2.5 Grams of the finely-ground flour are mixed in a mortar with 10 c.c. of water and 20 c.c. of sulphuric acid, D 1.7 (77%); at the end of twenty-five minutes the mass is washed into a 100 c.c. flask by the aid of dilute sulphuric acid (1 : 3), 5 c.c. of 8% phosphotungstic acid solution are added, and the process then continued as described (*loc. cit.*). When sulphuric acid is used, barley starch has $[\alpha]_D^{20}$ 191.7°, and this value differs for each kind of starch. Unless the value be determined for each starch, the hydrochloric acid method is to be preferred, as, in this case, the value is fairly constant.

W. P. S.

Estimation of Tartaric Acid in Wines by Evaporation. W. MESTREZAT (*Ann. Chim. anal.*, 1908, 13, 433—436).—The evaporation method proposed by Pasteur and modified by Reboul is considered to be more trustworthy than the official (French) method for the estimation of tartaric acid in wines. The following way of carrying out the estimation is recommended: 50 c.c. of the wine are evaporated to such an extent that the residue, when cold, is semi-fluid. After the lapse of five days, the crystals of potassium hydrogen tartrate which have formed are washed with 40% alcohol saturated previously with potassium hydrogen tartrate, and are then titrated in the usual manner.

W. P. S.

Estimation of Malic Acid. M. EMMANUEL POZZI-ESCOFFIER (*Bull. Assoc. chim. Sucr. Dist.*, 1908, 26, 266—267*).—It is pointed out by the author that the untrustworthiness of both the American official method and the process described by Cowles (*Abstr.*, 1908, ii, 904) for the estimation of malic acid is mainly due to the use of precipitants which are insoluble in alcohol, and that, at the same time, calcium malate is appreciably soluble in 85% alcohol. Malic acid is best precipitated by means of a solution of barium bromide in 96% alcohol, the solution being rendered slightly ammoniacal before use, and the precipitation made in the presence of an excess of alcohol.

W. P. S.

Detection of Benzoic Acid in Butter. LUCIEN ROBIN (*Ann. Chim. anal.*, 1908, 13, 431—433).—The author modifies the method described by Halphen (*Abstr.*, 1908, ii, 906) in order to prevent the formation of an emulsion when the butter is extracted. A portion of the butter is melted together with 50 c.c. of water, 15 c.c. of alcohol, and 0.5 gram of sodium hydrogen carbonate; the aqueous portion is then separated, acidified with sulphuric acid, heated, and filtered. The filtrate is shaken with ether, and the ethereal extract, after being washed with a mixture of 20 c.c. of water and 5 c.c. of alcohol, is shaken with 25 c.c. of the same water-alcohol mixture to which has been added 0.3 gram of sodium hydrogen carbonate. The aqueous portion, containing the benzoic acid as its sodium salt, is separated and evaporated to dryness; the residue is heated with 5 c.c. of sulphuric acid and 10 drops of fuming nitric acid until sulphuric acid fumes are given off, and the solution is then poured into 50 c.c. of cold water. After rendering the solution ammoniacal, a few drops of ammonium sulphide are added, when an orange-red coloration develops rapidly if the butter contains benzoic acid.

W. P. S.

Colour Reactions of Aromatic Aldehydes with Phenols and Various Cyclic, Heterocyclic, and Open-chain Compounds. C. FLEIG (*Bull. Soc. chim.*, 1908, [iv], 3, 1038—1045).—When an acid is added to a solution of an aromatic aldehyde in alcohol also containing one of a variety of substances of which the following may be mentioned as types, phenol, gallic acid, camphor, menthol, aniline, pyrrole, indole, mercaptan, and isobutyl alcohol, a coloration, usually yellow, orange, red, or violet, or in some cases a

* and *Bull. Soc. chim. Belg.*, 1908, 22, 413—414.

play of colours, is produced. The acid used may be sulphuric, hydrochloric, lactic, or a mixture of the last two. The colours given by menthol and terpin are similar to those yielded by cholesterol and biliary acids.

The aminophenols yield orange-red colorations, which turn yellow and finally disappear on addition of excess of acid. With alkalis they also change to yellow, but on the further addition of acid in excess become red. These changes are explained by assuming the existence in the solution of a tautomeric substance *d*; this, on addition of sodium hydroxide, forms a product *Nad*, which is yellow in presence of excess of alkali and red in presence of excess of acid.

These colour reactions can be applied in the detection of free hydrochloric acid in gastric juice, and possibly to the detection of mineral acids in adulterated wines.

T. A. H.

Colorimetric Estimation of Benzaldehyde in Almond Extracts. ALPHEUS G. WOODMAN and E. F. LYFORD (*J. Amer. Chem. Soc.*, 1908, 30, 1607—1611).—The reagents required are magenta decolorised by sulphurous acid and alcohol free from aldehyde. The former is prepared by dissolving 0.5 gram of magenta in 100 c.c. of water, and adding a solution containing 20 grams of sulphur dioxide. When decolorised, the solution is diluted to one litre. The alcohol is purified by distilling over silver oxide. To the distillate are added 15 grams of *m*-phenylenediamine hydrochloride per litre, a rapid current of air is drawn through the solution for three hours, and the alcohol is again distilled, the first 100 c.c. being rejected. The method as used with commercial almond extract may be outlined as follows:

Ten grams of the sample are diluted to 50 c.c. with the purified alcohol. Of this, 2 c.c. are placed in a Mohr cylinder and diluted with alcohol to 20 c.c. Three standard solutions are made up by diluting 2, 4, and 6 c.c. of benzaldehyde solution (alcohol containing 1 mg. of benzaldehyde per c.c.) to 20 c.c. and placing them in similar colorimeter tubes. The tubes are then placed for some time in water at 15°, and to the contents of each are added rapidly 10 c.c. of the magenta reagent, also at 15°. After ten minutes, the unknown sample is matched with the nearest standard in the usual manner by withdrawing part of either liquid. The depth of colour is proportional to the amount of benzaldehyde present.

L. DE K.

Detection of "Saccharin" (*o*-Benzoic-sulphinide) and other Artificial Sweetening Materials in Beverages and Foods. ALBERTO BIANCHI and ETTORE DI NOLA (*Boll. chim. farm.*, 1908, 47, 599—605). Compare this vol., ii, 440).—The authors give the following modification of the method devised by Villiers and others (compare Abstr., 1904, ii, 599) for the detection of *o*-benzoic-sulphinide in foods. The liquid, or, in the case of a solid, a suitable liquid extract, is freed from alcohol, heated to boiling, and acidified with about 20 drops of acetic acid per 100 c.c. The liquid is shaken, cooled, and mixed with about 10 c.c. of 20% lead acetate solution per 100 c.c. After half an hour, the excess of lead is precipitated by means of a solution containing 10% of sodium sulphate and 10% of

sodium phosphate, double the volume of lead acetate used being always sufficient. The filtered liquid, concentrated to 70–80 c.c. if necessary, is acidified with 6–8 c.c. of dilute sulphuric acid (1:3), and shaken in a separating funnel with its own volume of a mixture of equal parts of ether and benzene. The benzene-etheral extract is then slowly evaporated in a flat-bottomed glass dish. The residue is tested for (1) *o*-benzoisulphinide by tasting, and by fusion with sodium hydroxide at 270°; (2) salicylic acid by extracting with a small quantity of alcohol, diluting the alcoholic solution, and adding ferric chloride. If salicylic acid is found, it must be destroyed before the residue is tested for *o*-benzoisulphinide (compare Villiers, etc., *Abstr.*, 1904, ii, 599).

The above method also serves for the detection of the ammonium ("sucramine"), sodium ("sucrose"), and magnesium derivatives of *o*-benzoisulphinide, and of the so-called extract of sugar-cane, which is a solution of *o*-benzoisulphinide in glycerol.

"Dulcine" or "sucrol" (*p*-phenetolcarbamide) may be detected by treating a small portion of the residue left by the benzene-etheral extract (above) with silver nitrate (compare Ruggeri, *Ann. Lab. Centr. Gabelle*, 3, 143).

T. H. P.

Microchemical Studies. A. BOLLAND (*Monatsh.*, 1908, 20, 965–994).—A paper dealing with the microchemical detection of the following substances: methylamine, dimethylamine, trimethylamine, ethylamine, diethylamine, triethylamine, propylamine, amylamine, hexylamine, neurine, ethylenediamine, pentamethylenediamine, choline, betaine, methylguanidine, α -aminovaleric acid, parvoline, pilocarpine, piperine, coniine, conhydrine, ψ -conhydrine, hyoscyne, cornutine, ergotinine, colchicine, emetine, lobelline, solanine, solanidine, chelidonium, chelerythrine, sanguinarine, strophanthine, digitalin, picrotoxin, and santonin. The appearance, crystallographic and optical properties of the precipitates obtained on treating the tartrates of these substances with various reagents are described.

The refractive indices of the following alkaloids, determined by the immersion method, are given: solanine, solanidine, colchicine, conhydrine, ψ -conhydrine, and ergotinine; also of the tartrates of morphine, thebaine, quinine, cinchonidine, coniine, nicotine, hydrastine and cocaine.

W. H. G.

Colour Reactions of Proteins. C. FLEIG (*Ann. Chim. anal.*, 1908, 13, 427–431).—The following colour reactions are given by the proteins which contain a carbohydrate group in their molecule, namely, ovalbumin, ovoglobulin, serum-albumin, and particularly the glucoproteins (mucin). The test is best carried out by mixing a few drops of a 20% solution of the reagent with a dilute solution of the protein and pouring the mixture on to the surface of a little concentrated sulphuric acid contained in a test-tube. Orcinol, catechol, pyrogallol, phenol, menthol, camphor, terpene, carbazole, thiophen, and pyrrole give red colorations; resorcinol and indole blue, and phloroglucinol, reddish-brown.

INDEX OF AUTHORS' NAMES.

TRANSACTIONS, PROCEEDINGS, AND ABSTRACTS.

1908.

(Marked T., P., and A., i and A., ii respectively.)

COMPILED BY MARGARET D. DOUGAL.

A.

bott, *James Francis*, and *Andrew Cromore* Life, galvanotropism in bacteria, A., ii, 614.

Abderhalden, *Emil*, proteases in blood, A., ii, 305.

monomino-acids of byssus, A., ii, 517.

the degradation of 2:5-diketopiperazines in the organism of the rabbit, A., ii, 521.

albumose in the blood, A., ii, 605.

the nutritive value of protein cleavage products. VIII., A., ii, 1051.

Abderhalden, *Emil*, and *Louis Baumann*, tryptophan, A., i, 488.

polypeptides containing tryptophan, A., i, 932.

Abderhalden, *Emil*, and *Bruno Bloch*, metabolism in alcaptonuria, A., ii, 44.

Abderhalden, *Emil*, and *Dammhahn*, peptolytic ferments in germinating and ungerminated seeds of various plants, A., ii, 1065.

Abderhalden, *Emil*, and *Dénes Fuchs*, lactic acid in various keratins, A., i, 1029.

Abderhalden, *Emil*, and *Markus Gugenheim*, the action of tyrosinase from *Russula delica* on tyrosine, tyrosine-containing polypeptides, and other compounds, A., i, 237.

synthesis of polypeptides; derivatives of 2:5-di-iodo-L-tyrosine, A., i, 420, 886.

synthesis of polypeptides, A., i, 535.

the action of tyrosinase from *Russula delica* on polypeptides which contain tyrosine and on supracaine, A., i, 1030.

Abderhalden, *Emil*, and *Alfred Hirsowski*, synthesis of polypeptides. XVIII. Derivatives of glycine, *D*-alanine, *L*-leucine, and *L*-tyrosine, A., 887.

Abderhalden, *Emil*, and *Karl Kautsch*, comparative investigations on the elimination of iodine after administration of potassium iodide and saladin, A., ii, 611.

Abderhalden, *Emil*, and *Arthur H. Koelker*, the course of the fermentative degradation of polypeptides, A., i, 238, 488.

Abderhalden, *Emil*, and *E. S. London*, value of ultimate protein cleavage products in the organism; experiments on a dog with Eck's fistula, A., ii, 51.

Abderhalden, *Emil*, *E. S. London*, and *Berthold Oppler*, digestion of proteins in the alimentary canal of the dog. IV., A., ii, 514.

Abderhalden, *Emil*, and *Filippo Lusana*, action of the juices expressed from cells on polypeptides, A., i, 489.

Abderhalden, *Emil*, and *James S. McLester*, the behaviour of certain polypeptides towards the plasma of ox-blood, A., ii, 511.

Abderhalden, *Emil*, and *Wilfred H. Manwaring*, the behaviour of certain polypeptides towards the red corpuscles and platelets of ox-blood, A., ii, 510.

Abderhalden, *Emil*, and *Florentin Medigreceanu*, peptolytic ferments in the stomach contents, A., ii, 1049.

Abderhalden, *Emil*, and *Josef Olinger*, the value of protein cleavage products in the animal organism. VII., A., ii, 961.

Abderhalden, *Emil*, and *Auguste Billiet*, action of the juice of *Psalliota campestri* on polypeptides, A., i, 489.

Abderhalden, *Emil*, and *Leonhard Wacker*, the cleavage of 2:5-diketopiperazines in the organism of the rabbit. II., A., ii, 1052.

Abegg, *Richard* [*Wilhelm Heinrich*], an apparent exception to the theory of heterogeneous dissociation equilibria, A., ii, 157.

Abderhalden, *Emil*, and *Karl Kautsch*, comparative investigations on the elimination of iodine after administration of potassium iodide and saladin, A., ii, 611.

Abderhalden, *Emil*, and *Arthur H. Koelker*, the course of the fermentative degradation of polypeptides, A., i, 238, 488.

INDEX OF SUBJECTS.

TRANSACTIONS, PROCEEDINGS, AND ABSTRACTS

1908.

(Marked T., P., and A., i and A., ii respectively.)

A.

- brastol** (VITALI), A., ii, 642.
- absorption**, laws of, in the alimentary canal (LONDON and SANDBERG; LONDON), A., ii, 870.
- in the intestine, relationship of concentration to (LONDON and POLOW-ZOWA), A., ii, 1050.
- of carbohydrates (LONDON and POLOW-ZOWA), A., ii, 870.
- of fat from intestinal loops in dogs (PLANT), A., ii, 1050.
- of meat in the intestine (LONDON and SULIMA), A., ii, 870.
- of optically isomeric substances from the intestine, relative rate of (DAKIN), A., ii, 710.
- and assimilation of phosphorus organic compounds (MARFORI), A., ii, 1052.
- of poisonous gases by the respiratory tract (LEHMANN, WIENER, WILLKE, and YAMADA), A., ii, 771.
- of protein (v. KÖRÖSY), A., ii, 960.
- of proteins rich in bases (LONDON), A., ii, 870.
- of iodised proteins (v. FÜRTH and FRIEDMANN), A., ii, 1050.
- of tubercle bacilli (LONDON and RIW-KIND), A., ii, 870.
- absorption spectra**. See under Photochemistry.
- caroid resin oil** (HAENSEL), A., i, 665.
- caspenser Guldenstädtii*. See Sturgeon, Caspian.
- accumulator**. See under Electrochemistry.
- cenaphthene styphnate** (GIBSON), T., 2098; P., 241.
- cenaphthene**, 4-chloro-, and its pierate (CROMPTON and CYRIAX), P., 241.
- cet-**. See also Aceto-, Acetoxy-, Acetyl-, and under the parent Substance.
- Acetal**, $C_{13}H_{19}O_3N$, from alcohol, sodium ethoxide, sodium iodide, formamide, and chloroacetal (WOHL and LANGE), A., i, 17.
- Acetal**, amino-, synthesis of derivatives of (FISCHER), A., i, 544, 887.
- Acetals**, formation and hydrolysis of (FITZGERALD and LAPWORTH), P., 153.
- preparation of (HESS), A., i, 762.
- preparation of, by Claisen's method (ARDUSOFF), A., i, 555.
- Acetals**, sec-amino-, preparation of (PAAL and VAN GEMMER), A., i, 511.
- Acetaldehyde**, formation of, in alcoholic fermentation (TRILLAT; KAYSER and DEMOLON), A., i, 817.
- formation and disappearance of, under the influence of yeasts (TRILLAT and SAUTON), A., ii, 615.
- condensation products of, containing six and ten atoms of carbon (ZEISEL and v. BITTÓ), A., i, 761.
- copper compound (MAKOWKA), A., i, 328.
- Acetaldehyde**, amino-, phenylsazone of (NEUBERG), A., i, 323.
- bromo-, preparation of, and its diurethane (MAUGUIN), A., i, 941.
- Acetamide**, platinumous (HOFMANN and BUGGE), A., i, 141.
- Acetamide**, bromo-, modification of the preparation of methylamine from (FRANÇOIS), A., i, 956.
- dichloronitro-** (STEINKOFF and KIRCHHOFF), A., i, 963.
- halogen derivatives, action of phosphorus pentachloride on (STEINKOFF, BENEDEK, GRÜNUPP, and KIRCHHOFF), A., i, 961.
- iodo-, compound of, with dimethylaniline (v. BRAUN), A., i, 629.

- Acetanilide**, 2:6-di-bromo- and *m*-nitro-, and its halogen derivatives (KÖRNER and CONTARDI), A., i, 524. *
- chloro-derivatives** (SCHWABER, SCHULZ, and JOCHHEIM), A., i, 974. *
- cyanoamino-** (PIERON), A., i, 926.
- Halogen derivatives** (MANNINO and DI DONATO), A., i, 826.
- 2:4:5-tri-iodo-**, and **4-** and **6-iodo-3-nitro-**, and **2:4-di-iodo-3-nitro-** (KÖRNER and BELASIO), A., i, 778. *
- o-nitro-** and **o-nitroso-**, crystallography of (JAEGER), A., i, 147.
- m-** and **p-nitroso-** (CAIN), T., 681; P., 78.
- Acetanilides**, isomerism of (HINSBERG), A., i, 257.
- Acetatochromo-base**, salts of an (WEINLAND), A., i, 847.
- Acetcarbamidoxime** (*dimethylcarbamide-ketoxime*) (GONDUCHE), A., i, 155.
- Acetic acid** and benzoic acid, heat of neutralisation of, by aniline in benzene solution (VIGNON and EVIEUX), A., ii, 664.
- and formic acid, rate of distillation of (RICHMOND), A., i, 754.
- sulphides** of, and their salts (HOLMBERG), A., i, 309.
- tin derivative** (GLASMANN and NOVICKY), A., i, 121.
- Acetic acid**, salts, compounds of, with acetic anhydride (FRANZEN), A., i, 937.
- basic aluminium**, **chromium**, and **iron salts** (DE HAËN), A., i, 886.
- calcium salt**, behaviour of, in the organism (BONANNI), A., ii, 213.
- complex chromium salts** (WERNER, JOVANOVIĆ, ASCHKINASY, and POSSELT), A., i, 935.
- mercuric salt**, action of, on hydroxyazo-compounds (SMITH and MITCHELL), T., 842; P., 70.
- Acetic acid**, ethyl ester, bistriazo-derivative of (FORSTER, FIERZ, and JOSHUA), T., 1070; P., 102.
- Acetic acid**, amino-. See Glycine.
- bromo-**, ethyl ester, action of magnesium on (STOLLE), A., i, 310; (ZELNER), A., i, 760.
- bromo-** and **chloro-**, and their salts, rate of hydrolysis of, by water and by alkali, and the influence of neutral salts on the reaction velocities (SESTER), P., 89.
- bromo-**, **mono-**, **di-**, and **tri-chloro-**, and **cyano-**, glucinum salts (GLASMANN and NOVICKY), A., i, 121.
- tri-bromo-**, compounds of, with dimethylpyrone (PLOTNIKOFF), A., i, 281.
- Acetic acid**, chloro-, condensation of, with *p*-diaminodiphenylmethane (NEUMÜLLER), A., i, 369.
- and its ester, preparation of cyanoacetic acid from (PHELPS and TILLOTSON), A., i, 757.
- preparation of malonic acid and its ester from (PHELPS and TILLOTSON), A., i, 757.
- dichloro-**, action of, on aniline and its homologues (v. OSTROMBSLENSKY), A., i, 82, 888; (HELLER and LRYDEN), A., i, 216.
- trichloro-**, esterification of (KAILAN), A., ii, 936.
- cyano-**, and its ester, preparation of, from chloroacetic acid (PHELPS and TILLOTSON), A., i, 757.
- salts of, with carbanides (BATEM), A., i, 253.
- esterification of (PHELPS and TILLOTSON), A., i, 756.
- ethyl ester, action of phenylthiocarbimide on (RUHEMANN), T., 621; P., 53.
- conversion of, into ethyl malonate (PHELPS and TILLOTSON), A., i, 756.
- imino-**, methyl ester (CURTIUS, DARAPSKY, and MÜLLER), A., i, 145.
- iodo-**, *l*-menthyl ester, and its reaction with ammonium bases (E. and O. WEDEKIND), A., i, 258.
- nitrosoimino-**, methyl ester, azoimide, and hydrazide and its dibenzylidene derivative (CURTIUS, DARAPSKY, and MÜLLER), A., i, 145.
- Acetic anhydride**, compounds of, with acetates (FRANZEN), A., i, 937.
- as reagent for distinguishing between enolic and ketonic modifications (MICHAEL and MURPHY), A., i, 949.
- Acetic anhydride**, iodo- (ABDERHAELEN and GUGGENHEIM), A., i, 886.
- Acetic fermentation**. See under Fermentation.
- Acetimide chloride**, nitro- (STRECKOFF and BOHRMANN), A., i, 328.
- Aceto-**. See Acet-, Acetoxy-, Acetyl-, and under the parent Substance.
- Acetoacetic acid**, synthesis of, by perfusion through the liver (FRIEDMANN), A., ii, 205, 719.
- formation of, in the liver (EMBEDEN and ENGEL), A., ii, 515.
- formation of, in the liver of diabetic dogs (EMBEDEN and LATTES), A., ii, 515.
- degradation of, in the animal body (EMBEDEN and MICHAUD), A., ii, 515, 967.

- acetoacetic acid, and acetone, Folin's method of separating, in urine (HART), A., ii, 742.
- acetoacetic acid, ethyl ester, isomerism of (McCREA), A., i, 759.
- condensations with, and their reversion (DIECKMANN and KRON), A., i, 388.
- condensation of, with alkylguanidines (MAJIMA and KOBAYASKI), A., i, 222.
- calcium derivative (ERDMANN and VAN DER SMISSEN), A., ii, 589.
- acetoacetic acid, α - and γ -bromo, esters, action of diazo-chlorides on (FAVREL), A., i, 209.
- $\gamma\gamma$ -dibromo-, ethyl ester (FAVREL), A., i, 209.
- γ -bromo- α -cyano-, γ -chloro- α -cyano-, and $\alpha\gamma$ -dicyano-, ethyl esters, and their derivatives (BENARY), A., i, 600.
- isonitroso-, ethyl ester, benzoylhydrazones of, and its fission products (BÜLOW and SCHAUB), A., i, 687.
- acetoacetic ester synthesis, mechanism of the (CLARK), A., i, 124.
- ceto- α - and - β -naphthalides, halogen derivatives of (MANNINO and DI DONATO), A., i, 827.
- acetonazine, isonitroso- (PONZIO and GIOVETTI), A., i, 834.
- acetone and chloroform (DOTT), A., i, 306.
- benzene, and toluene, dispersion in the electric spectra of (COLLEY), A., ii, 909.
- vapour pressure of aqueous solutions of (MAKOVETZKI), A., ii, 353.
- reaction of, with mercuric iodide in alkaline solution (MARSH and STRUTHERS), P., 266.
- condensation of, with oxalic ester (CLARK), A., i, 124.
- oxidation of (FOURNIER), A., i, 247.
- formation of, in the animal body (FRIEDMANN; DAKIN), A., ii, 719; (KNOOP), A., ii, 720.
- formation of, from $\alpha\beta$ -unsaturated acids by perfusion through the liver (FRIEDMANN), A., ii, 719.
- formation of, in the liver (EMBDEN and MARX), A., ii, 515.
- estimation of (HEIKEL), A., ii, 235.
- estimation of, in urine (HART), A., ii, 783.
- and acetoacetic acid, Folin's method for separating, in urine (HART), A., ii, 742.
- ketone bases, cyclic, condensation of, with benzaldehyde (PAULY and RICHTER), A., i, 285.
- Acetonedicarboxylic acid, esters, condensation of, with aldehydes under the influence of ammonia and amines (PATRASKO-KRITSCHENKO and PRITOFF), A., i, 564.
- Acetonedimethyl- and -ethyl acetals, α -dichloro- (WOHL and KÖPPEN), A., i, 942.
- Acetonehæmin (MERUNOWICZ and ZALESKI), A., i, 232.
- Pennstedt's method for the analysis of (ZALESKI), A., ii, 132.
- Acetonitrile, additive compound of, with silicon tetrabromide (REYNOLDS), P., 280.
- Acetonitrile, amino-, aromatic derivatives, action of cyanogen bromide and of bromine on (V. BRAUN), A., i, 626.
- bromo-, new method of preparing, and its addition to tertiary bases and alkaloids (V. BRAUN), A., i, 675.
- bromo-, chloro-, and iodo-derivatives, preparation of (STEINKOPF), A., i, 720.
- iodo-, synthesis of (V. BRAUN), A., i, 627.
- nitro-, and its salts, and α -bromonitrile (STEINKOPF and BOHRMANN), A., i, 327.
- Acetonitriles, arylsulphonated (TRÖGER and LINDNER), A., i, 633.
- and their condensation with aromatic aldehydes and with amyl nitrite and sodium ethoxide (TRÖGER and PROCHNOW), A., i, 798.
- Acetonylacetone, condensation of, with nitromalonaldehyde (HALE and ROBERTSON), A., i, 634.
- Acetonylacetone-*p*-nitrophenylosazone (AUWERS and HESSENLAND), A., i, 552.
- Acetonylazoimide. See Triazoacetone.
- 2-Acetonylphenol, 4-nitro-, and its methyl and ethyl ethers and oxime, and 4:6-dinitro-, and its ethyl ether (HALE and ROBERTSON), A., i, 634.
- Acetophenone, reaction of, with mercuric iodide in alkaline solution (MARSH and STRUTHERS), P., 267.
- fixation of, by benzoylacrylic acid (BOUGAULT), A., i, 796.
- Acetophenone, bromo-*m*-nitro-, preparation of, and *m*-nitro-, acetate of (EVANS and BROOKS), A., i, 388.
- 2:4-dihydroxy-. See Resacetophenone.
- α -nitroso- (HELLER and NÖTZEL), A., i, 267.
- Acetophenonecarboxylic acid, reaction of, with aniline (MEYER), A., i, 26.
- Acetophenonephenylhydrazones, amino- (WEIL), A., i, 983.

- Aceto-*p*-toluidide**, *o*-iodochloride and 2-iodo- (WILLGERODT and GARTNER), A., i, 878.
- Aceto-*o*- and -*p*-toluidides**, halogen derivatives (MANNINO and DI DONATO), A., i, 826.
- Acetovanillone**. See Apocynin.
- Acetoxaluric acid**, potassium salts (BEHREND and BEER), A., i, 840.
- Acetoxime**, influence of acids and alkalis on the velocity of formation of (BARRETT and LAFWORTH), T., 85.
- Acetoxy-**. See also under the parent Substance.
- Acetoxyacetic acid** (*acetylglucolic acid*) (NEF), A., i, 7.
- p*-Acetoxybenzoic acid** (*acetylsalicylic acid*), anhydride and chloride of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 984.
- brucine and cinchonine salts, and their optical activity (HILDITCH), T., 1391; P., 186.
- β*-Acetoxy-*sec*.-butyl-*tri*- and -*tetra*-bromophenyl acetate**, *p*-*α*-dibromo- (ZINCKE and GOLDEMAN), A., i, 781.
- Acetoxy-carboxylic acids**, hydrolytic fission of (KATH), A., ii, 94.
- Acetoxydimethoxytriphenylcarbinyl ethyl ether** (HEKZIG), A., i, 880.
- β*-Acetoxy-ketones**, constitution of the (BLAISE), A., i, 78.
- Aceto-*m*-xylidide**, 3:5:6-*tri*-bromo- and -chloro- (MANNINO and DI DONATO), A., i, 826.
- p*-Acetoxyphenylarsonic acid** and its sodium salt (BARROWCLIFF, PYMAN, and REMFERY), T., 1895.
- 3-Acetoxyphenyl-2-methylnaphthaphenazonium salts** (KEHRMANN and STERN), A., i, 221.
- Acetoxyphenylnaphthaphenazonium chlorides**, 3- and 6- (KEHRMANN and STERN), A., i, 220.
- 4-Acetoxy-sulphotritanic acid**, 2-hydroxy-, ammonium salt (v. LIEBIG and HERB), A., i, 450.
- 2-Acetoxytolyl-5-*ar*sonic acid** and its sodium salt (BARROWCLIFF, PYMAN, and REMFERY), T., 1896.
- Acetyl-**. See also Acet-, Aceto-, Acetoxy-, and under the parent Substance.
- Acetyl chloride**, *α*-agent for distinguishing between enolic and ketonic modifications (MICHAEL and MURPHY), A., i, 949.
- iodo- (ABDERHALDEN and GUGGENHEIM), A., i, 886.
- Acetylacetone**, action of carbamide on (DE HAAN), A., i, 577.
- condensation of, with *o*- and *p*-nitrobenzyl chlorides (MECH), A., i, 655.
- Acetylacetone**, alkaline-earth, cadmium, mercuric, and zinc derivatives (TANAKA and KUBOVSKI), A., i, 502.
- Acetylacetonecarbamide** (MAJIMA and KOBAYASHI), A., i, 224.
- α*-Acetylacetic acid**, ethyl ester, anilide of (SIMONSEN), T., 1031.
- Acetyl-*d*-alanyl-glycine** and its chloride, -glycylglycine and its ester, and -glycyl-*l*-tyrosine and its methyl ester, chloro- (FISCHER), A., i, 325.
- Acetyl-*d*-alanyl-*l*-tyrosine**, chloro- (ABDERHALDEN and HIRSZOWSKI), A., i, 888.
- Acetylallanturic acid** and its phenylhydrazone and reactions (BEHREND and BEER), A., i, 841.
- Acetyl-amino-**. See under the parent Substance.
- Acetylanhydromethylbaptigenin** (GORTER), A., i, 98.
- Acetylanhydripropurpurgallonecarboxylic acid** (A. G. and F. M. PERKIN), T., 1192; P., 149.
- Acetylaniline-*p*-sulphonic acid**, amides of (GELMO), A., i, 409.
- 1-Acetylanilino-benzoxazole** (YOUNG and DUNSTAN), T., 1055; P., 136.
- Acetylanthranil**, 4-nitro-, reaction of, with primary amines (BOCCART and KLABER), A., i, 466.
- Acetylanthranilic acid**, brucine and cinchonine salts, and their optical activity (HILDITCH), T., 1391; P., 186.
- Acetylation** (LAW), A., i, 321.
- of amino-groups, acids as accelerators in the (SMITH and ORTON), T., 1242; P., 132.
- Acetylbenzyl cyanides**. See Acetylphenylacetoneitriles.
- 7-Acetylbutyric acid** and its semicarbazone and hydrate (HAWORTH and PERKIN), T., 588.
- Acetylcatechol**, *α*-nitro-, preparation of (FARBWERKE VORM. MEISTER, LUCK, & BRÜNING), A., i, 655.
- 3-Acetylcatechol**, amino-, preparation of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 262.
- Acetylchloroxylose** (RYAN and EBRILL), A., i, 716.
- Acetyldiglucoamine** (OFFER), A., i, 99.
- Acetyldiglycinimide**, chloro- (BERGELL and FEIGL), A., i, 140.
- Acetyldihydro-*s*-*α*-*β*-naphthazine** (FISCHER and STRAUS), A., i, 222.
- Acetyldimethylcarbamide**, cyano-, and its reactions (BAUM), A., i, 253, 292.
- 2-Acetyl-*α*-dimethyl-*α*-valeric acid** and its ethyl ester, oxime, and semicarbazone (RUPE and LIECHTENHANS), A., i, 390.

- petyldiphenylmethane and its oxime and amino- and nitro-derivatives (DUVAL), A., i, 277.
 Acetyl-*o*-diphenylthiocarbamide and the action of caustic alkali and of heat on (DIXON and TAYLOR), T., 690; P., 74.
 Acetylene, thermal decomposition of (BONKE and COWARD), T., 1197; P., 167.
 action of sulphur on (CAPELLE), A., i, 201; (OECHSNER DE CONINCK), A., i, 750.
 condensation product from, by means of the dark electric discharge (JOVITSCHITSCH), A., i, 118.
 condensation products, absorption of oxygen by (LOSANITSCH), A., i, 846.
 di- and tetra-chlorides, preparation of (TOMPKINS), A., i, 750; (LIDHOLM), A., i, 938.
 copper compound, constitution of (SCHEIBER and FLEBBE), A., i, 933.
 magnesium bromide. See Magnesium-acetylene bromide
 metallic compounds (MAKOWKA), A., i, 928.
 estimation of phosphorus, sulphur, and silicon in (FRAENCKEL), A., ii, 953.
 acetylene, chloro-, mercuric derivative (HOFMANN and KIRMREUTHER), A., i, 145.
 acetylenecarbamide and its tetra-acetyl derivative (BILIZ and HOKRMANN), A., i, 62.
 acetylenedicarboxylic acid, alkaloidal salts, and their optical activity (HILBITCH), T., 706; P., 61.
 acetylenic acids, formation of 4-pyrone compounds from (RUHEMANN), T., 431, 1281; P., 52, 177.
 acetyl-*dl*-erythronic acid (NEF), A., i, 7.
 Acetyl-1-ethyl- Δ^1 -cyclohexen-3-one (BLAISE and MAIRE), A., i, 391.
 -Acetylformanilideoxime, cyano- (WIELAND and GMEIN), A., i, 1013.
 acetylglcollic acid. See Acetoxyacetic acid.
 acetylketen and its phenylhydrazone-phenylhydrazide (CHICK and WILSON), T., 946; P., 100.
 Acetylmethylaminoanthraquinone and 4-nitro- (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 456.
 acetylmethylcarbinol (methylacetol), formation of, in the acid fermentation of wines, and its osazone and semicarbazone (PASTUREAU), A., ii, 136.
 Acetyl-1-methyl- Δ^1 -cyclohexene and its oxime and semicarbazone (WALLACH and EVANS), A., i, 404.
 Acetylnarcotine (KNOLL & Co.), A., i, 285.
 Acetylphenylacetone, *o*-, *m*-, and *p*-, chloro-, and 3-nitrochloro- of the *p*-compound (KUNCKEL and FLOS), A., i, 860.
 Acetylphenylglycine, *o*-chloro-, and its ethyl ester (SCHWALBE, SCHULZ, and JOCHHEIM), A., i, 975.
 Acetylphenylhydrazine, conditions of formation of (MILBATH), A., i, 672.
 Acetylphosphamic acid, halogen and halogen-nitro-derivatives of (STEINKOPF, BENEDEK, GRÜNNUPF, and KIRCHHOFF), A., i, 962.
 Acetylperone, ω -nitro-, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 655.
 α -Acetyl- γ -propionyl-*n*-butyric acid, ethyl ester, and its disemicarbazone (BLAISE and MAIRE), A., i, 391.
 Acetylsalicylic acid. See *o*-Acetoxybenzoic acid.
 6-Acetyloluene, 3-*o*-dichloro-. See *o*-Tolyl chloromethyl ketone, 5-chloro-.
 Acetyl-*l*-tryptophan, chloro- and iodo- (ABDERHALDEN and BAUMANN), A., i, 932.
 Acetyltyrosine, iodo-derivatives of (ABDERHALDEN and GUGGENHEIM), A., i, 887.
 Acetyl-*l*-tyrosine, chloro-, derivatives of (FISCHER), A., i, 544.
 Acetyltyrosylglycine, chloro-, and its derivatives (FISCHER), A., i, 544.
 Acetyltyrosylglycyl- α -alanine, chloro-, methyl ester, methyl carbonate of (FISCHER), A., i, 887.
 Acetyl-*d*-valine, chloro- (FISCHER and SCHEIBLER), A., i, 957.
 Acetylveratrole, amino-, preparation of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 262.
 Acetylveratrole, ω -nitro-, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 655.
 Acetylvanillic acid and lactone (WINZHEIMER), A., i, 805.
 Acid, $C_6H_8O_6$, from the action of calcium hydroxide on lactose (KILIANI), A., i, 716.
 $C_6H_8O_7$, and its salts, from the action of calcium hydroxide on lactose (KILIANI), A., i, 716.
 $C_7H_8O_8$, and its esters, from the hydrolysis of ethyl 6-methyl-2-pyrone-3:5-dicarboxylate (SIMONSEN), T., 1027.
 $C_9H_8O_8$, and its derivatives, from pimpinellin (HERZOG and HÄNCH), A., i, 905.

- Acid, $C_8H_8O_6$** , from the oxidation of 11:5-trimethyl-2-cyclohexen-3-one (CROSSLEY and GILLING), F., 180.
- $C_8H_{12}O_4N_2$** , and its amide, bromide, and chloride, from biscyanomethylpiperidium bromide (V. BRAUN), A., i, 608.
- $C_{10}H_{14}O_2$** , and its silver salt, from pinene (HENDERSON and HEILBRON), T., 291; P., 31.
- $C_{10}H_{14}O_4$** , from the oxidation of 4:5-dimethoxy-2-methylbenzaldehyde (GATTERMANN), A., i, 34.
- $C_{10}H_{16}O_2$** , and its chloride, and their bromo-derivatives, from pinene (HENDERSON and HEILBRON), T., 290; P., 31.
- $C_{10}H_{18}O_2$** (two), from the glycol from camphene (MILOBENDSKI), A., i, 93.
- $C_{10}H_{17}O_2Br$** , from cyclohexene-*n*-butyric acid (WALLACH, CHURCHILL, and RENTSCHLER), A., i, 405.
- $C_{11}H_{16}O_2$** , from yangonol (WINZHEIMER), A., i, 805.
- $C_{11}H_{15}O_2N$** , and its ethyl ester, from 2-methylindole and ethyl oxalate (ANGELI and MARCETTI), A., i, 207.
- $C_{12}H_{14}O_4$** , from turmeric oil (RUPE), A., i, 95.
- $C_{12}H_{14}O_2$** , from turmeric oil (RUPE), A., i, 95.
- $C_{12}H_{12}O_6H_2O$** , and its salts, from aldol and malonic acid in quinoline (RIEDEL), A., i, 501.
- $C_{13}H_{20}O_2$** , from dimethylcampholide (KOMPPA), A., i, 353.
- $C_{13}H_{12}O_8S$** , ammonium and barium salts, from the action of ammonium sulphite on the lactone of β -iodo- γ -hydroxy-3:3:4-methylenedioxyphenylvaleric acid (BOUGAULT), A., i, 538.
- $C_{17}H_{16}O_4$** , and its derivatives, from rottlerin (HERRMANN), A., i, 99.
- $C_{18}H_{32}O_8$** , from triolein ozonide (MOLINARI and FENAROLI), A., i, 849; (MOLINARI and BAROSI), A., i, 850.
- $C_{18}H_{13}O_5N$** , and its ethyl ester, from the oxidation of ethyl 2:6-diphenylpiperidone-3:5-dicarboxylate (PETRENKO-KRITSCHENKO and PETROFF), A., i, 565.
- $C_{20}H_{32}O_8$** , and its salts, from the acid, $C_{20}H_{40}O_8$ (WINDAUS), A., i, 728.
- $C_{20}H_{32}O_8$** , from cholesterol (WINDAUS), A., i, 728.
- $C_{20}H_{40}O_8$** , from olive leaves (POWER and TUTTIN), T., 894; P., 117.
- $C_{22}H_{40}O_8$** , and its esters and salts, from cholesterol (WINDAUS), A., i, 264, 728.
- Acid, $C_{22}H_{40}O_2$** , and its ethyl ester, from olive bark (POWER and TUTTIN), T., 907; P., 117.
- $C_{22}H_{39}O_2N_2$** , and its salts, from the acid, $C_{22}H_{40}O_2$, and nitric and acetic acids (WINDAUS), A., i, 728.
- $C_{22}H_{39}O_2$** , and its silver salt, from onocerin (V. HEMMELMAYR), A., i, 185.
- $C_{22}H_{42}O_9$** , from the oxidation of the ketonic acid, $C_{22}H_{42}O_3$ (DORÉZ and GARDNER), T., 1331.
- $C_{22}H_{44}O_4$** , and its silver salt, from the oxidation of cholesterol (PICKARD and YATES), T., 1685; P., 121.
- $C_{22}H_{29}O_4N$** , and its salts, from the substance, $C_{22}H_{22}O_2N$ (AVERY and MCDOLE), A., i, 344.
- $C_{27}H_{44}O_4$** , from the interaction of sulphuric acid with 1:3:5-triphenylbenzene-2':2'':2'''-tricarboxylic acid (ERRERA), A., i, 185.
- $C_{27}H_{40}O_9$, $C_{27}H_{40}O_8$** , and their esters and salts, from cholesterol (WINDAUS), A., i, 264.
- $C_{27}H_{40}O_8$** , and its dimethyl ester and its oxime, from dehydrositosteradiene (PICKARD and YATES), T., 1932; P., 228.
- $C_{27}H_{40}O_2$** , and its ethyl ester and acetyl derivative, from the oxidation of cholesterol (PICKARD and YATES), T., 1685; P., 121.
- $C_{30}H_{50}O_2$** , and its ethyl ester, from olive bark (POWER and TUTTIN), T., 912; P., 118.
- $C_{35}H_{58}O_9$** , and its ethyl ester and salts, from olive bark (POWER and TUTTIN), T., 906; P., 117.
- $C_{35}H_{58}O_2$** , and its ethyl ester and salts, from olive bark (POWER and TUTTIN), T., 910; P., 118.

- and bases, diagrammatic representation of equilibria between, in solution (HENDERSON), A., ii, 675.
- the relationship between the strength of, and their capacity to preserve neutrality (HENDERSON), A., ii, 268.
- and pseudo-acids, comparison of, in pyridine solution (HANTZSCH and CALDWELL), A., ii, 21.
- of unchangeable constitution, unchangeability of the colour of, during the formation of alkali salts and ions (HANTZSCH, CLARK, and MEYER), A., ii, 447.
- of high melting point in Japanese wax (SCHAAL), A., i, 3.
- of the formula, $\text{CH}_3\text{CH}=\text{CH}_2\text{CO}_2\text{H}$ (R being phenyl more or less substituted), action of nascent hypiodous acid on (BOUCAULT), A., i, 179, 269.
- containing adjacent unsaturated groups, optically active salts of (HILDRICH), T., 1388; P., 186.
- use of phenolphthalein as indicator in the titration of, in presence of sulphurous acid (POZZI-ESCOT), A., ii, 628.
- volumetric estimation of, in air (HENRIET and BONYSSY), A., ii, 734.
- estimation of, in wine, in presence of alcohol and glycerol (HEIDUSCHKA and QUINCKE), A., ii, 73.
- acids, aromatic, synthesis of (EYKMAN), A., i, 794.
- action of ammonia on (KORCZYŃSKI), A., i, 977.
- reduction of, in presence of nickel oxide (IPATIEFF and PHILIPPOFF), A., i, 342.
- substituted, synthesis of (EYKMAN), A., i, 22.
- di-basic, synthesis of (BLANC), A., i, 244, 245.
- new determinations of the secondary ionisation constants of (McCOY), A., ii, 466; (CHANDLER), A., ii, 467; (WEGSCHEIDER), A., ii, 1009.
- Acids, di-basic, esterification of, by diazomethane (WEGSCHEIDER and GEHRINGER), A., i, 792.
- di-basic saturated, simple ester anhydrides of (MOL), A., i, 76.
- di- and poly-basic, unsymmetrical, esterification of (WEGSCHEIDER and GEHRINGER), A., i, 792; (WEGSCHEIDER; WEGSCHEIDER, v. RUSNOV, and v. DUBRAV), A., i, 793; (WEGSCHEIDER and STRAUCH), A., i, 794.
- polybasic, ferrous and ferric double salts of (SCHOLZ), A., i, 603.
- fatty, from mummies (SCHMIDT), A., i, 878.
- acidification and distillation of • (DUBOVITZ), A., ii, 991.
- capillary properties of aqueous solutions of (v. SZYSZKOWSKI), A., ii, 1018.
- oxidation of (FRIEDMANN; DAKIN), A., ii, 719; (KNOOP), A., ii, 720.
- action of metallic magnesium on (FENTON and SISON), A., i, 243.
- of protein putrefaction (NEUBERG and ROSENBERG), A., i, 116.
- hydrates of (TSAKALOTOS), A., i, 598.
- according to measurements of the viscosity of their solutions (TSAKALOTOS), A., i, 498.
- mode of oxidation of phenyl derivatives of, in the organism (DAKIN), A., ii, 965.
- oxidation of phenyl derivatives of, by the organism and by hydrogen peroxide (DAKIN), A., ii, 720.
- constitution of glucinum salts of (GLASMANN and NOVICKY), A., i, 120.
- preparation of isobornyl esters of (CHEMISCHE FABRIK VON HEYDEN), A., i, 351, 809.
- fatty saturated, oxidation of ammonium salts of, with hydrogen peroxide (DAKIN), A., i, 119.
- fatty unsaturated, addition of hydrogen iodide to (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 123.
- higher fatty, preparation of diacylglycerides of (ULZER, BATIK, and SOMMER), A., i, 310.
- in liver after removal (LEATHES), A., ii, 1054.
- azo-colouring matters from the aminoanilides of (SULZBERGER), A., i, 226.
- higher fatty brominated, alkaline earth salts of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 122.

- Acids**, normal fatty, esterification constants of (SUNDSCHEID and GRIFFITHS), T., 210; P., 14.
 melting points of anilides, *p*-toluidides, and α -naphthalides of (ROBERTSON), T., 1033; P., 120.
 mixed and volatile, new method of estimating, in wine (POZZI-ESCOFF), A., ii, 904.
 free, detection of, in organic liquids (REPITON), A., ii, 781.
 inorganic complex (MOLATI and PIZZIGHELLI), A., ii, 595.
 mineral, relative efficiencies of, as deduced from their conductivities and hydrolytic activities (ARMSTRONG and WHEELER), A., ii, 815.
 detection and estimation of free, in red wines (ASTRE), A., ii, 892.
 organic, affinity constants of, determined with the help of indicators (SALM), A., ii, 677.
 reactions of, with mercuric chloride (OECHSNER DE CONINCK and DAUTRY), A., i, 392.
 colour reactions of, with phenols (FENTON and BARR), A., ii, 438.
 salts, the electrolytic chlorination of (INGLIS and WOOTTON), T., 1592; P., 174.
 metallic salts (WERNER, JOVANOVIĆ, ASCHKINASY, and POSSELT), A., i, 935.
 organic non-volatile, estimation of, in tobacco (TOTH), A., ii, 238.
 organic volatile, estimation of, in tobacco (TOTH), A., ii, 330.
 saturated, and their esters, electrolytic production of, from the corresponding unsaturated compounds (BOEHNINGER & SÜHNE), A., i, 122.
 saturated or unsaturated, alkaloidal salts, relation between optical activity and unsaturation in (HILDITCH), T., 700; P., 61.
 tautomeric, and salts, reactions of, with diazomethane and alkyl haloids (ACREE, JOHNSON, BRUNEL, SHADINGER, and NIRDLINGER), A., i, 919.
 unsaturated, action of nascent hypiodous acid on (BOUGAULT), A., i, 179, 269, 537, 791, 983.
 catalytic reduction of (PAAL and GERUM), A., i, 599.
 addition of mercaptans to (POSNER and BAUMGARTH), A., i, 21.
 of the benzene series, relation between the absorption spectra and chemical constitution of (BALY and SCHAEFER), T., 1808; P., 267.
Acids, ω -unsaturated, behaviour of, when perfused through the liver (FRANMANN), A., ii, 719.
 weak, hydrolysis of salts of, and its variation with temperature (LIXDÉN), A., ii, 164.

- between acids and bases in solution, diagrammatic representation of (HENDERSON), A., ii, 675.

AFFINITY, CHEMICAL:

Chemical equilibria, hydrocarbon, calculation of (v. WARTEMBERG), A., ii, 26, 678.

Chemical equilibrium between carbon dioxide, sodium hydrogen carbonate, sodium phosphate, and disodium phosphate at body temperature (HENDERSON and BLACK), A., ii, 467.

the system, copper oxide, sulphur trioxide, and water at 25° (BELL and TABER), A., ii, 382.

conditions of, in the systems, ferric chloride, potassium ferrocyanide, water (VOLSCHIN), A., ii, 468.

the system, mercuric chloride, ammonium chloride, and water at 30° (MEERBURG), A., ii, 676.

in the system, silver nitrate and pyridine (KAHLEBERG and BREWER), A., ii, 469.

Equilibrium constant, influence of the solvent on the (PISSARJEWSKY and LEVITES), A., ii, 570.

Equilibrium relations of chromates in solution (SHEKILL, EATON, MEERILL, and RUSS), A., ii, 92.

Kinetics and catalysis of the hydrogen peroxide-thiosulphate reaction (ABEL), A., ii, 26.

of the reaction between chloric and hydrochloric acids; a reaction of the eighth order (LUTHER and MACDOUGALL), A., ii, 361.

of the transformations of radioactive compounds (GUYE), A., ii, 451.

of successive reactions (JABŁCZYŃSKI), A., ii, 935.

of the sulphonation reaction (MARTINSEN), A., ii, 572.

Reactivity of undissociated electrolytes (WEGSCHEIDER), A., ii, 265.

Chemical reaction, reversible, dynamic theory of a (COHEN and STENGERS), A., ii, 824, 934; (SMITS and WILAUT), 824, 934.

Chemical reactions, mechanism of; intermediate products and intermediate structures (TIFFENEAU), A., i, 117.

in a magnetic field (BERNDT), A., ii, 756.

Transition concentrations (WIRTH), A., ii, 570.

Catalysis (STIEGLITZ), A., ii, 29, 472; (ACREK, JOHNSON, and NIRDLINGER), A., ii, 29; (ACREK), A., ii, 169, 472, 492; (MCCRACKEN), A., ii, 572; (SCHLESINGER), A., ii, 680.

AFFINITY, CHEMICAL:

Catalysis, stereochemistry of (BREDIG and FAJANS), A., ii, 263.

in heterogeneous systems (JABŁCZYŃSKI), A., ii, 680.

examination of the conception of hydrogen ions in (LAPWORTH), T., 2187; P., 276.

of esters and of imino-esters by acids (STIEGLITZ), A., ii, 167.

of imino-esters (DERBY), A., i, 419; (STIEGLITZ), A., ii, 168.

Catalytic actions of colloidal metals of the platinum group (PAAL and GERUM; PAAL and ROTH), A., i, 599.

Catalytic ester exchanges (KRELMANN), A., i, 120; ii, 1021; (STRITAK and FANTO), A., ii, 677, 1021.

Catalytic pulsations, excitation and regulation of, by means of an electric current (BREDIG and WILKE), A., ii, 679.

Catalytic reactions and photochemical equilibria (VANZETTI), A., ii, 915.

at high temperatures and pressures (IPATIEFF), A., ii, 266, 332, 347, 386; (IPATIEFF, JAKOWLEFF, and RAKITIN), A., i, 330; (IPATIEFF and PHILAPOFF), A., i, 342.

induced by enzymes (ACREE), A., ii, 1022.

of oxidation and reduction of unsaturated organic compounds (FOKIN), A., i, 311.

of sunlight (NEUBERG), A., ii, 915.

Dissociation as measured by lowering of freezing point and by electrical conductivity; bearing on the hydrate theory (JONES and PEARCE), A., ii, 19.

by absorbing substances of the compounds formed by basic and acidic dyes (PELET-JOLIVET), A., ii, 18.

of a compound in a state of equilibrium, and a thermodynamic relation necessary to the validity of the law of constant proportions (RUER), A., ii, 819.

variation of the degree of, of certain electrolytes with temperature (CAMPETTI), A., ii, 1010.

double, of quaternary ammonium compounds (v. BRAUN), A., i, 627.

of the polyiodides of the alkali metals and ammonium radicals (DAWSON), T., 1308; P., 131.

Dissociation equilibria, heterogeneous, an apparent exception to the theory of (ABEGG), A., ii, 157.

AFFINITY, CHEMICAL:—

- Dissociation pressures** of some metallic carbonates and hydroxides (JOHNSTON), A., ii, 358; (SCHOTTKY), A., ii, 1016.
- of certain oxides of cobalt, copper, antimony, and nickel (FOOTE and SMITH), A., ii, 847.
- of ferric oxide (WALDEN), A., ii, 852.
- of solid and liquid substances, simple apparatus for demonstrating (v. ZAWIDZKI), A., ii, 261.
- Energy**, free, change of, accompanying the formation of some fused salts of the heavy metals (LORENZ and FOX), A., ii, 656.
- changes attending the formation of certain carbonates and hydroxides (JOHNSTON), A., ii, 812.
- internal, of dissolved substances (SCHUKAREFF), A., ii, 462.
- potential, of the elements (RANKIN), A., ii, 680.
- Enzyme action**, studies on (ARMSTRONG and GLOVER), A., i, 712; (H. E. and E. F. ARMSTRONG and HORTON), A., i, 745.
- discussion on the mechanism of (PHILOCHE), A., i, 712.
- Hydrolysis**, theory of (FANTO and STRITAR), A., i, 499; (STIEGLITZ; ACRKE), A., ii, 472.
- as illustrated by heats of neutralisation (VELEY), A., ii, 813.
- hydrolylation, and hydronation as determinants of the properties of aqueous solutions (ARMSTRONG), A., ii, 814.
- influence of salts on, and the determination of hydration values (ARMSTRONG and CROTHERS), A., ii, 816.
- of the glycerides, theory of the (WEGSCHEIDER), A., i, 499; ii, 165.
- during ester exchanges in homogeneous systems (STRITAR and FANTO), A., ii, 677, 1021; (KREMAN), A., ii, 1021.
- of salts (ROSENSTIRHL), A., ii, 164.
- in solution; lecture experiment (VANZETTI), A., ii, 805.
- electrometric determination of the (DENHAM), T., 41.
- of the salts of weak acids and bases and its variation with temperature (LUNDEN), A., ii, 164.
- Hydrolytic fission** of acetoxycarboxylic acids (RATH), A., ii, 94.
- Velocity of absorption** of gaseous by solid substances (HANTZSCH and WIEGNER), A., ii, 158.

AFFINITY, CHEMICAL:—

- Velocity of catalytic reactions** in heterogeneous systems (TELETOFF), A., ii, 95.
- Velocity of chemical change**, determination of the, by measurement of the gases evolved (LAMPLOUGH), P., 29; (CAIN and NICOLE), P., 282.
- Velocity of change** in solid alloys, method for the measurement of (BENGOUGH), P., 145.
- Velocity of esterification** of benzoyleformic acid and *p*-mandelic acid, by means of alcoholic hydrogen chloride (KAILAN), A., ii, 28.
- of cinnamic and hydrocinnamic acids by means of alcoholic hydrogen chloride (KAILAN), A., ii, 27.
- of nitrocinnamic acids by means of alcoholic hydrogen chloride (KAILAN), A., ii, 27.
- Velocity of hydrolysis** of chloroacetates, bromoacetates, and α -chlorohydrin by water and by alkali, and the influence of neutral salts on the reaction velocities (SENTER), P., 89.
- Velocity of neutralisation** at low temperatures, attempt to measure the (ABEGG and NEUSTADT), A., ii, 162.
- Velocity of reaction** (VAN LAAR), A., ii, 824, 934.
- Schütz's rule for (ARRHENIUS), A., ii, 678.
- relation between the, and the velocity of stirring in non-homogeneous systems (JABŁOZYŃSKI), A., ii, 1020.
- in gases which are in a state of motion (BODENSTEIN and WOLGAST), A., ii, 162.
- in gases moving through heated vessels and the effect of convection and diffusion (LANGMUIR), A., ii, 1020.
- in solutions of different salts, but with the same ion (VANDELDE), A., ii, 571.
- Velocity of chemical reactions**, temperature-coefficient of the (TRAUTZ and VOLKMANN), A., ii, 824.
- Velocity of reduction** of the oxides of bismuth, cadmium, and lead by carbon monoxide (BRISLEE), T., 154.
- Velocity constants** and mechanism of the reactions of alkyl halides with urazoles and urazole salts (ACRKE and SHADINGER), A., ii, 163.
- Agaricic acid**, constitution of, and its esters, potassium salt, and anhydride (THOMS and VON ANG), A., i, 4.

- Agglutination and coagulation** (ABERHOLD), A., ii, 832.
lyolysis, and hemolysis (NEUBERG), A., ii, 708.
- Agglutinins, electrical charge of** (FIELD and TEAGUE), A., ii, 118.
 in lymph and serum, action of lymphagogues on the concentration of (BRAUDE and CARLSON), A., ii, 310.
- Agrotobenzaldehyde, constitution of** (HELLER and SOURDIS), A., i, 208.
- Agriculture, danger of employing arsenic salts in** (BRETEAU), A., ii, 837; (MESTREZAT), A., ii, 1069.
- Agrostemma Githago, sapotoxin and sapogenin from** (BRANDL), A., i, 818.
- Agrostemmic acid from Agrostemma Githago** (BRANDL), A., i, 818.
- Air.** See Atmospheric air.
- Alanine, synthesis of** (ZELINSKY and STADNIKOFF), A., i, 607.
 elimination of, by the urine (BRUGSCH and HIRSCH), A., ii, 611.
- α -Alanine derivatives, synthesis of** (ABDERHALDEN and HIRSZOWSKI), A., i, 887.
- β -Alanine, α -bromo-, hydrobromide of** (GABRIEL), A., i, 181.
- Alanine anhydride, nitration and acetylation of** (FRANCHIMONT and FRIEDMANN), A., i, 509.
- Alanyl- β -aminobutyric acid and its copper salt** (KAY), A., i, 774.
- α -Alanyldiglycylglycine** (ABDERHALDEN and HIRSZOWSKI), A., i, 888.
- α -Alanyldiglycylglycine** (FISCHER), A., i, 325.
- Alanylglycinimide and its hydrochloride** (BERGELL and FEIGL), A., i, 141.
- α -Alanylglycylglycine** (FISCHER), A., i, 325.
- α -Alanyl- γ -tryptophan anhydride** (ABDERHALDEN and BAUMANN), A., i, 932.
- α -Alanyl- γ -tyrosine and 3:5- α -iodo-** (ABDERHALDEN and HIRSZOWSKI), A., i, 888.
- α -Alanyl- γ -tyrosine, 3:5- α -iodo-** (ABDERHALDEN and GUGGENHEIM), A., i, 887.
- α -Alanyl- δ -valine and its anhydride** (FISCHER and SCHEIBLER), A., i, 958.
- Albite from Greenland** (DREYER and GOLDSCHMIDT), A., ii, 116.
- Albumin, synthesis of living** (LATHAM), A., i, 709.
 diffusion of, into gelatin jellies (MÜLLHAUSEN), A., ii, 670.
 vanillin-hydrochloric acid as a test for (ROSENTHALER), A., ii, 76.
 estimation of, in urine by Esbach's method (VAN DER HART), A., ii, 643.
- Albumins, action of thorium nitrate and of uranyl nitrate on** (SZILARD), A., i, 68.
- Albumose in blood** (ABDERHALDEN), A., ii, 605.
 amount of in blood (FRÉUND), A., ii, 117, 512; (ABDERHALDEN), A., ii, 805.
- Albumoses, peptones, and glycine, isolation of, from dilute aqueous solutions** (SIEGFRIED), A., i, 234.
 preparation of stable soluble compounds of hexamethylenetetramine silver nitrate with (BUSCH), A., i, 712.
- Alcaptonuria, metabolism in** (ABDERHALDEN and BLOCH), A., ii, 54.
- Alcohol.** See Ethyl alcohol.
- Alcohol, C_2H_5O , and its acetate and phenylurethane, from cyclobutylidimethylcarbinol** (KINER), A., i, 530.
 $C_6H_{10}O_3$, methyl ether, from ostragole methylodihydrin (DAUFRENESE), A., i, 20.
 $C_6H_{16}O$, and its phenylurethane and acid phthalic ester, from pinene (HENDERSON and HELLBROUN), T., 292; P., 81.
 $C_{10}H_{18}H_2O$, secondary, from δ -pinene (SMIRNOFF), A., i, 278.
 $C_{10}H_{18}O$, from the substance $C_{10}H_{18}O$ (TUTIN), T., 257.
 $C_{10}H_{20}O$, from the reduction of geraniol (ENKLAAR), A., i, 664.
 $C_{11}H_{18}O_2$, from the action of magnesium methyl iodide on methyl *m*-methoxytoluate (BÉHAL and TRÉFÉNEAU), A., i, 630.
 $C_{14}H_{26}O_2$, and its acetyl derivative, from hecraol myrrh (v. FRIEDRICH), A., i, 97.
 $C_{17}H_{32}O_3$ (or $C_{22}H_{38}O_3$), and its acetyl derivative, from Grindelia resin (POWER and TUTIN), A., ii, 526.
 $C_{25}H_{48}O$, from olive bark (POWER and TUTIN), T., 910; P., 118.
- Alcoholic fermentation.** See Fermentation.
- Alcoholometry, gravimetric** (BLONDEAT), A., ii, 990.
- Alcohols, index of refraction of mixtures of, with water** (DOROSCHIEWSKY and DVORSCHANTSCHIK), A., ii, 241, 785.
 decomposition of, in presence of metallic oxides (IPATIEFF), A., ii, 472.
 decomposition of, under the catalytic influence of charcoal (braise) (LEMOINE), A., i, 595.

- Alcohols, catalytic dehydration of, by calcium sulphate and by aluminium silicate (STROBERG), A., i, 495.
quantitative researches on the exhalation of (POHL), A., ii, 1056.
and wide, action of, on frogs (NAZARI), A., ii, 973.
Alcohols of the allyl series, use of magnesium in place of, zinc in the synthesis of (JAYORSKY), A., i, 753.
aromatic, new reactions of (FOSSE), A., i, 85.
dicyclic, with bridged linkings, formation of (RABE and JAHR), A., i, 533.
ditertiary, from phenanthraquinone (ZINCKE and TROPP), A., i, 786.
fatty, contact oxidation of (ORLOFF), A., i, 306.
hydroaromatic, preparation of alkyl-oxyacetyl derivatives of (FARBEN-FABRIKEN FORM. F. BAYER & Co.), A., i, 429.
multivalent, complex compounds of, with metallic salts (GRÜN and BOCKISCH), A., i, 934.
olefinic, formation of (GRY), A., i, 307.
primary, action of metallic oxides on (SABATIER and MAILHE), A., i, 594, 715.
transformation of, into aldehydes and hydrogen (BOUVEAULT), A., i, 117.
three new primary, from the condensation of sodium benzyloxide with propyl, butyl, and isoamyl alcohols (GUERBET), A., i, 635.
See also Amino-alcohols, Benzoyl-alkylamino-alcohols, Chlorohydrins, α -Dialkyl- β -keto-alcohols, Iodo-hydrins, and Keto-alcohols.
Aldebaranium (V. WELSBACH), A., ii, 591; (URBAIN), A., ii, 849.
Aldehyde. See Acetaldehyde.
Aldehyde, $C_7H_{12}O$, and its oxime and semicarbazone, from cyclobutylidimethylcarbinol (KIJNER), A., i, 531.
 $C_{11}H_{12}O_2$, and its derivatives, from α -tetrahydro- α -naphthol (GATTERMANN), A., i, 30.
Aldehyde-acids, naphtharesorcinol as a reagent for (MANDEL and NEUBERG), A., ii, 993.
Aldehydephenylhydrazones, action of nitrogen peroxide on (CIUSA and PESTALOZZA), A., i, 833.
Aldehydes and quinones, preparation of (LANG), A., i, 350.
formation of, during acetic fermentation (FARNSTEINER), A., ii, 318.
Aldehydes, formation of, under the influence of yeasts (TRILLAR and SAUTON), A., ii, 615, 722.
formation of, from their acids (MERLING), A., i, 653; (STAUDINGER), A., i, 654.
transformation of α -hydroxy-acids into (GUERBET), A., i, 123.
formation of, from primary alcohols (BOUVEAULT), A., i, 117.
formation of, from amides of α -bromo-fatty acids (MOSSLER), A., i, 133.
preparation of, from aromatic compounds containing the group C_6H_5 by oxidation with ozone (SPURGE), A., i, 423.
condensation of acetonedicarboxylic esters with, under the influence of ammonia and amines (PETRENKO-KRITSCHENKO and PETROFF), A., i, 564.
action of a mixture of mercury diethyl and sodium on (SCHORIGIN), A., i, 881.
condensation of, with *p*-phenylenediamine, β -naphthylamine, and β -naphthylhydrazine (KOTHEFUSSENER), A., i, 52.
action of phosphorus pentachloride and of thionyl chloride on (HOERING and BAUM), A., i, 528 (SCHMIDT), A., i, 654.
condensation of, with substituted rhodanic acids (ANDREASCH), A., i, 683.
4:4'-bismethylhydrazinodiphenylmethane for characterising (V. BRAUN), A., i, 700.
estimation of, by the spectroscopy (BRUYLANTS), A., ii, 437.
Aldehydes, aromatic, synthesis of (GATTERMANN), A., i, 28.
condensation of, with aminohydroxy acids (PUXEDDU), A., i, 286.
condensation of, with cyclic ketone (WALLACH, MALLISON, and MARTIUS), A., i, 424.
action of potassium cyanide on (EKKERANTZ and AHLQVIST), A., i, 992.
formation of bases by the condensation of, with phenyl-*p*-phenylenediamine, and their hydride chlorides (MOORE and WOODBRIDGE), A., i, 686.
colour reactions of, with phenols and various cyclic, heterocyclic, and open-chain compounds (FLEIG), A., ii, 1078.
cyclic, method of preparing (SAVARIAN), A., i, 1885.

- Aldehydes**, fatty, condensation of, with phenol (LUNJAK), A., i, 416.
 melting points of the *p*-nitrophenylhydrazones of, and their identification (DAKIN), A., ii, 234.
 $\alpha\beta$ -unsaturated, condensation reactions of (MEERWEIN), A., i, 89, 545.

- γ -Aldehydobutyric acid** and its oxime, semicarbazone, and nitrophenylhydrazone (HARRIES and TANK), A., i, 517.
- β -Aldehydo- β -isocaproic acid**, ethyl ester (HARDING, HAWORTH, and PERKIN), T., 1968.
- β -Aldehydopropionic acid**, diphenyldihydrotetrazole of (FICHTER and GUGGENHEIM), A., i, 106.
- β -Aldehydopropionylphenylhydrazide**, diphenyldihydrotetrazole, phenylhydrazone of, and the *p*-bromo-derivative of the hydrazone (FICHTER and GUGGENHEIM), A., i, 105.
- β -Aldehydopropionyl-*p*-tolylhydrazide**, *p*-tolylhydrazone and di-*p*-tolyl-dihydrotetrazole of (FICHTER and GUGGENHEIM), A., i, 106.
- β -Aldehydovaleric acid** and its *p*-nitrophenylhydrazone (HARRIES and v. SELAWA NEYMAN), A., i, 968.
- Alko-ketens** (STAUDINGER and KLEVER), A., i, 318.
- Alkol**, condensation of, with malonic acid (RIEDEL), A., i, 501.
- Alloximes**, new method of studying intramolecular change in (PATTERSON and McMILLAN), A., ii, 266.
- Ligae**, behaviour of, to salts at certain concentrations (TAKEUCHI), A., ii, 613.
 marine, biological succession of mineral substances in (SCURTI and CALDIERI), A., ii, 57.
- Alimentary canal**, laws of digestion and absorption in the (LONDON and SANDBERG; LONDON), A., ii, 870.
 fat-splitting in the (LONDON and WERSLOWA), A., ii, 870.
 of the dog, digestion of proteins in the (ABDERHALDEN, LONDON, and OPLER), A., ii, 514.
 of goats, gases produced in the (BOYCOTT and DAMANT), A., ii, 122.
- Alizarin**, direct product of, from anthraquinone (BADISCHE ANILIN- & SODA-FABRIK), A., i, 191.
- Alkali bromides and chlorides**, double, with zinc bromide and chloride (EPKRAIM), A., ii, 693.
- Alkali carbonates**, biological method for estimating in soils (CHRISTENSEN), A., ii, 67.
 and alkaline-earth carbonates, thermochemical data of (DE FORCRAND), A., ii, 256.*
 chlorates and perchlorates, electrolytic production of (COULEROU), A., ii, 689.
 chlorides, separation of lithium chloride from the (KAHLENBERG and KRAUS-KOFF), A., ii, 777.
 cadmium chlorides (v. BIRON and APHANASSIEFF), A., ii, 249.
 cyanides and cyanamides (BADISCHE ANILIN- & SODA-FABRIK), A., i, 964.
- Electrode**. See Electrode under Electrochemistry.
- hydroxides containing carbonates, volumetric estimation of, by Winkler's method (SØRENSEN and ANDERSEN), A., ii, 534.
 iodates and periodates, specific gravity and solubility of (BARKER), T., 15.
 iodides, specific gravities of (DANTER and BRINK), A., ii, 377.
 iridichlorides and iridiochlorides (DELEPINE), A., ii, 702; (VEZES), A., ii, 703.
 iridiochlorides, oxalate reduction of (DELEPINE), A., ii, 765.
 metals, radioactivity of the (McLENNAN and KENNEDY), A., ii, 750.
 spectra of the (RUNGE), A., ii, 73; (RITZ), A., ii, 445.
 ultra-red emission spectra of the (BERGMANN), A., ii, 242, 336.
 cause of the emission of the principal series lines of the, and the Doppler effect in canal- and anode-rays (FREDENHAGEN), A., ii, 79.
 the absolute distribution of intensity in the continuous background of the spectra of the (LEDER), A., ii, 5.
 heat of solution of the (RENGADE), A., ii, 155.
 solutions of, in liquid ammonia (RUFF and ZEDNER), A., ii, 585.
 alloys of, with mercury (SMITH), A., ii, 38.
 polyiodides of, chemical dissociation of (DAWSON), T., 1308; P., 131.
 electrolytic dissociation of (DAWSON and JACKSON), T., 2063; P., 213.
 separation of, electrolytically (GOLDBAUM and SMITH), A., ii, 1072.
 nitrates, spontaneous crystallisation of solutions of (JONES), T., 1739; P., 196.

- Alkali nitrates, double, with nitrates of the cerium metals (WYROUBOFF), A., ii, 385.
 peroxides, heat of formation of (RANKADE), A., ii, 155.
 silicates (JÖRDIS), A., ii, 103, 492.
 polysulphides, action of methyl sulphate on (STRECKER), A., i, 386.
 thioantimonates (DONK), A., ii, 763, 859.
 trithionates and tetrathionates (MACKENZIE and MARSHALL), T., 1726; P., 199.
- Alkaline-earth carbonates and alkali carbonates**, thermochemical data of (DE FOUCRAND), A., ii, 256.
 influence of addition of chloride on the reaction between carbon, nitrogen, and (KÜHLING and BERKHOLD), A., i, 143.
 cyanides and cyanamides (BADISOHLER ANILIN- & SODA-FABRIK), A., i, 964.
 iodides, specific gravities of (BAXTER and BRINK), A., ii, 377.
 metals, preparation of (v. KÜGELGEN), A., ii, 379.
 preparation of colloidal amorphous forms of crystalline and soluble salts of (v. WEIMANN), A., ii, 842.
 oxides, crystallisation of, from their nitrates (BRÜGELMANN), A., ii, 842.
 salts, anomalous modifications of the band spectra of, in the magnetic field (DUFOUR), A., ii, 138.
 colloidal and gelatinous (NEUBERG and REWALD), A., ii, 495.
- Alkaline earths**, alloys of, with mercury (SMITH), A., ii, 38.
 estimation of, in manures and soils (FOERSTER), A., ii, 1072.
 estimation of, in waters (BLACHER and JACOBY), A., ii, 897.
- Alkalinity**, determination of, by electrochemical means (LANGE), A., ii, 534.
- Alkalis**, action of, on sodium alkyl thiosulphates (PRICE and TWISS), T., 1395, 1403; P., 179, 185.
 action of, on sodium ethyl thiosulphate (GUTMANN), A., i, 497.
 compounds of, with mercuric cyanide (HOFMANN and WAGNER), A., i, 514.
 separation of magnesium from the (GOOCH and EDDY), A., ii, 632.
- Alkaloid**, $C_{20}H_{27}O_2N$, and its additive salts, from Chinese *Corydalis* tubers (MAKOSHI), A., i, 825.
- Alkaloids**, affinity of certain, for hydrochloric acid (VELEY), T., 2114; P., 234.
- Alkaloids**, cinchona. See *Cinchona* of *Corydalis*. See *Corydalis*.
 of *Nigella* (KELLER), A., i, 283.
 Strychnos. See *Strychnos*.
 reaction of, with sodium hyypobromite (DEHN and SCOTT), A., i, 780.
 addition of bromoacetonitrile to (v. BRAUN), A., i, 676.
 and artificial antitoxins, supposed antidotes to (DORLENCOURT), A., ii, 721.
 and iron, double salts of (SCHOLTZ), A., i, 202.
 reactions of (REICHARD), A., ii, 643.
 estimation of, by means of picrolonic acid (MATTHES and RAMMSTEDT), A., ii, 75.
 estimation of total, in cinchona barks (COHEN), A., ii, 996.
 estimation of total, in coca leaves (DE JONG), A., ii, 440; (GRESHOFF), A., ii, 441.
- Alkyl argenticyanides**, heats of combustion of (GUILLEMAUD), A., i, 719.
 haloids, interaction of, with aluminium (SPENCER and WALLACE), T., 1829; P., 194.
 action of amorphous arsenic on (AUGER), A., i, 13.
 direct interaction of, with magnesium (SPENCER and CREWSDON), T., 1821; P., 194.
 iodides, effect of heat on (KAHAN), T., 132.
 nitrates, reduction of, to nitrites in alkaline solution (GUTMANN), A., i, 597.
 sodium compounds and syntheses therewith (SCHORIGIN), A., i, 881, 886.
 sodium thiosulphates, action of alkalis on (PRICE and TWISS), T., 1395, 1403; P., 179, 185.
- Alkylamines**, formation of, in nerve degeneration (BAUER), A., ii, 717.
- Alkylaminoacetals** (PAAL and VAN GEMBER), A., i, 511.
- Alkylaminoalkyl p-aminobenzoates**, preparation of (MERCK), A., i, 266.
 benzoates, preparation of (FAREWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 266.
- 2-Alkylamiloxyrines** (MICHAELIS, MIELECKE, and LUTZE), A., i, 61.
- 8-Alkylcinnamic acids** (RUPE and BUSOLT), A., i, 23; SCHROETER and BUCHHOLZ), A., i, 169.
- Alkylene glycol-chlorohydrin ethers**. See *Glycol-chlorohydrin ethers*.
- Alkylguanidine salts** (MAJIMA), A., i, 228.

- Alkylguanidines**, condensation of, with ethyl acetacetate (MAJIMA and KOBAYASHI), A., i, 223.
- 1-Alkylcyclohexan-2-one-1-carboxylic acids**, esters, influence of the alkyl groups on the synthesis and degradation of (KÖTZ, BIEBER, HESSE, and SCHWARZ), A., i, 24.
- N-Alkylketoximes** (SCHEIBER), A., i, 763; (SCHEIBER and BRANDT), A., i, 764.
- Alkyl-oxy-groups**, displacement of, in the benzene nucleus by hydrogen (SEMMLER), A., i, 557.
- 4-Alkylquinolines** (BLAISE and MAIRE), A., i, 566.
- Alkylsulphine perbromides and periodides** (TINKLER), T., 1611; P., 191.
- 2-Alkylthiolbenzoic acids** (*alkylthiol-salicylic acids*), preparation of (FARNWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 797.
- Alkyl vinyl ketones**, reactions of (MAIRE), A., i, 247; (BLAISE and MAIRE), A., i, 390.
- fixation of amines on the ethylenic linking of (BLAISE and MAIRE), A., i, 398.
- fixation of aromatic amines on (BLAISE and MAIRE), A., i, 566.
- action of nitrogen-containing reagents on the carbonyl group of (MAIRE), A., i, 290.
- Allantoin**, the importance of, in uric acid metabolism (WIECHOWSKI), A., ii, 119.
- Allophane**, ratio of alumina and silica in (STREMMER), A., ii, 1041.
- Alloporphyrin** and its salts and anhydride (WILLSTÄTTER and PFANNENSTIEL), A., i, 198.
- Alloxanyltetramethyl-m-phenylenediamine** (SACHS and APPENZELLER), A., i, 187.
- Alloys** of metals which form nitrides, preparation of (BECK), A., ii, 837.
- electrical conductivity of, and their temperature coefficients (GUERTLER), A., ii, 557; (RUDOLFI), A., ii, 923.
- thermal diagrams and microscopy of (FRIEDRICH), A., ii, 1045.
- binary, correction of the ideal melting-point curves of (MAZZOTTO), A., ii, 660.
- method for the measurement of rate of change in solid (BENGOUGH), P., 145.
- hardness of (SAPOSHNIKOFF), A., ii, 600.
- optical method for determining the relative hardness of contiguous structural elements of (CIGLER), A., ii, 593.
- Alloys**, interaction of, with mercury (MALLER), A., ii, 187.
- qualitative study of (GOLITTI), A., ii, 945.
- analysis of (NAMIAS), A., ii, 326; (SCHÜRMANN and SCHARFFENBERG), A., ii, 537; (SCHÜRMANN and ARNOLD), A., ii, 898.
- planimetric analysis of (BENGOUGH), P., 146; (HUNTINGTON and DESCH), A., ii, 846.
- estimation of lead in (ELBORNE and WARREN), A., ii, 735.
- Allyl alcohol**, triiodo-, and its acetate (LESPIEAU), A., i, 496.
- Allylamine**, action of nitrous acid on (HENRY), A., i, 81.
- Allylaminoacetal** and its derivatives (PAAL and VAN GEMMER), A., i, 511.
- Allylazoimide** and its dibromide and diazamine-compound (FORSTER and FIERZ), T., 1174; P., 143.
- 1-ψ-Allyl-3:4-catechol methylene ether**. See ψ-Safrole.
- 3-ψ-Allyl-*o*-cresol** and its methyl ether (BEHAL and TIFFENEAU), A., i, 930.
- Allylhippuric acid** (SØRENSEN), A., i, 981.
- 3-Allylhydantoin** (BAILEY and RAX-DOLPH), A., i, 741.
- α-Allynaphthalene** and its diiodohydrin (TIFFENEAU and DAUDEL), A., i, 972.
- Allylthiocarbamide**, reaction of, with acetyl chloride (DIXON and TAYLOR), T., 22.
- Allylthiocarbimide**, action of, on ethyl sodiomalonate (RUHEMANN), T., 625.
- Almond**, globulin from the. See under Globulin.
- Almond extracts**, colorimetric estimation of benzaldehyde in (WOODMAN and LYFORD), A., ii, 1079.
- Almond tree**, gum of the (HUERRE), A., i, 606.
- Alnus glutinosa*, alcohols and resinous acids in the varnish from the leaves of (H. and A. v. EULER), A., i, 39.
- Aloesol**, a complex phenol from aloes, and tetrachloro- and its acetyl derivative (LEGER), A., i, 40, 980.
- Aloisite**, a new hydrosilicate from the tufa of Fort Portal, Uganda (COLIMBA), A., ii, 956.
- Alumina**. See Aluminium oxide.
- Aluminium**, the chief inorganic element in a proteaceous tree, and the occurrence of aluminium succinate in trees of this species (SMITH), A., ii, 885.
- in the potential series (VAN DEVENTER and VAN LUMMEL), A., ii, 12, 558; (VAN LAAR), A., ii, 248, 558.

- Amides, molecular complexity of, in various solvents** (MELDRUM and TURNER), T., 876; P., 98.
- influence of, on protein metabolism** (FRIEDLÄNDER), A., ii, 514.
- of higher fatty acids, compounds of, with chloral** (SULZBERGER), A., i, 960.
- acid, action of beer yeast on** (EFFRONT), A., i, 491.
- value of, in Carnivora** (VÖLTZ and YAKUWA), A., ii, 207.
- N*-methylol compounds of** (EINHORN, FEIBELMANN, GÖTTLER, HAMBURGER, and SPRÖNGERTS), A., i, 603.
- aromatic, of the higher fatty acids, interaction of diazo-salts with** (SULZBERGER), A., i, 483.
- diphenylated acid, preparation of, by the action of diphenylcarbamide on acids** (HERZOG and HÄNCH), A., i, 268.
- halogenated acid, action of phosphorus pentachloride on** (STEINKOFF, BENZDEK, GRÜNUPF, and KIRCHHOFF), A., i, 961.
- plant, nutritive value of** (SCHULZE), A., ii, 960.
- Amides, thio-. See Thioamides.**
- Amidines, the chemistry of the** (YOUNG and DUNSTAN), T., 1052; P., 136.
- Amine, C_6H_7N , and its hydrochloride and platinichloride, from pinene** (HENDERSON and HILLBRON), T., 293; P., 31.
- $C_{15}H_{25}O_2N$, from the reduction of methylvanillin oxime** (RÜCHEMEER and SCHÖN), A., i, 154.
- Amines, reaction of, with alkyl vinyl ketones** (BLATSE and MAIRE), A., i, 398.

- Amines**, action of, on cinnamylideneacetic acid and its methyl ester (RIEDEL), A., i, 536.
 interaction of, with 2:3:5-trinitro-4-acetylaminophenol (MELDOLA and HAY), T., 1659; P., 197.
 combination of, with benzoic acid (v. LIEBIG), A., i, 646.
 and ammonia, separation of, by means of boiling absolute alcohol (BERTHEAUME), A., ii, 742.
- Amines**, aromatic, reaction of, with glyoxal sodium hydrogen sulphite (HINSBERG), A., i, 455.
 action of halogens on, and their use in the synthesis of certain dyes (OSTROGOVICH and SILBERMANN), A., i, 373.
 reaction of, with sodium hypobromite (DENN and SCOTT), A., i, 780.
 reduction of, in presence of nickel oxide (IPATIEFF), A., i, 332.
 fixation of, on alkyl vinyl ketones (BLAISE and MAIRE), A., i, 566.
 aromatic primary, condensation of chloral with (WHEELER, DICKSON, JORDAN, and MILLER), A., i, 332.
 phenyl derivatives of (GOLDBERG and SISOEFF), A., i, 17.
 aromatic secondary, action of formaldehyde on (v. BRAUN), A., i, 684.
 aromatic tertiary, addition of bromoacetonitrile to (v. BRAUN), A., i, 676.
 fatty, affinity constants of, as determined by the aid of methyl-orange (VELEY), T., 661; P., 50.
 primary, reaction of, with 4-nitroacetylthranil (BOGERT and KLABER), A., i, 466.
 compounds of, with cobaltinitrites (CUNNINGHAM and PERKIN), P., 212.
 racemic, resolution of, by means of camphoric acids (FREYLLON), A., i, 827.
 tertiary, as reagents for distinguishing between enolic and ketonic derivatives (MICHAEL and SMITH), A., i, 943.
 See also Bases.
- Aminoacetals** and amino-aldehydes (WOHL), A., i, 46.
- Amino-acid**, $C_{21}H_{35}O_6N$, and its methyl ester and salts, from aconine (SCHULZE), A., i, 561.
- Amino-acids**, synthesis of (SØRENSEN and ANDERSEN), A., i, 649, 675.
 action of carbon disulphide on (KÜRNER), A., i, 509.
 decomposition of, by *Bacillus proteus vulgaris* (NAWIASKY), A., ii, 614.
- Amino-acids**, reduction of, to amino-aldehydes (NEUBERG), A., i, 322.
 of byssus (ANDERHALDEN), A., ii, 517.
 in meat extracts (MICKO), A., ii, 713.
 in urine during pregnancy (VAN LEE-SUM), A., ii, 715.
 fate of, in the dog (FRIEDMANN), A., ii, 205.
 new compounds of, with ammonia (BERGELL and FEIGL), A., i, 140, 396.
 derivatives of, applicable for synthetical purposes (GABRIEL), A., i, 181.
 racemic. See Racemic amino-acids.
- Amino-acids**, halogen (WHEELER and CLAPP), A., i, 897, 981.
- α -Amino-acids**, hydrocyclic (SKITA and LEVI), A., i, 884.
- Amino-alcohol**, $C_{12}H_{19}O_3N$, and its benzoyl derivative, from estragole iodohydrin and dimethylamine (DAUFRESNE), A., i, 19.
 $C_{11}H_{22}O_3N$, from estragole iodohydrin and diethylamine (DAUFRESNE), A., i, 20.
 $C_{16}H_{19}O_3N$, from the action of nitrous acid on di-*p*-methoxydianinostillbene (FISCHER and PRATSE), A., i, 220.
 $C_{21}H_{35}O_6N$, and its salts and their acetyl derivatives, from aconine (SCHULZE), A., i, 561.
 and its benzoate hydrochloride and phenylurethane hydrochloride, from the reduction of ethyl β -diethylaminoethyl ketone (BLAISE and MAIRE), A., i, 398.
- Amino-alcohols**, formation of (DAUFRESNE), A., i, 19; (FOURNEAU and TIFFENEAU), A., i, 123; (FAREWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 167; (RIEDEL), A., i, 250, 956.
 preparation of acyl derivatives of (FAREWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 167, 169, 176.
- Amino-aldehydes** and aminoacetals (WOHL), A., i, 46.
 and amino-ketones of the aromatic series, relation between the absorption spectra and chemical constitution of (BALY and MARSDEN), T., 2108; P., 235.
 reduction of amino-acids to (NEUBERG), A., i, 322.
- Aminoalkyl esters**, relation between chemical constitution and physiological action in certain substituted (PYMAN), T., 1793; P., 208.
 acylated, preparation of (RIEDEL), A., i, 769.

- Aminocarboxylic acids**, affinity constants of, as determined by the aid of methyl orange (VIELER), T., 662; P., 50.
- Amino-compounds**, action of, on chloromethyl sulphate (HOUBEN and ARNOLD), A., i, 533.
- amphoteric, union of carbon dioxide with (SIEGFRIED and NEUMANN; SIEGFRIED and LIEBERMANN), A., i, 379.
- aromatic, action of sulphites on (BUCHERER and SEYDE), A., i, 455. See also under the parent Substance.
- Amino-groups**, acids as accelerators in the acetylation of (SMITH and ORTON), T., 1242; P., 132.
- N-Amino-groups** in heterocyclic compounds (BÜLOW and KLEMMANN), A., i, 54.
- N-Aminoheterocyclic compounds** (FRANZEN and SCHEUERMANN), A., i, 293.
- Amino-hydroxy-acids**, synthesis of (SÖRENSEN and ANDERSEN), A., i, 649. condensation of, with aromatic aldehydes (PUXEDDU), A., i, 286.
- β -Amino- α -hydroxy-acids**, preparation of esters of (LES ÉTABLISSEMENTS POULENG FRÈRES & ERNEST FOURNEAU), A., i, 937.
- Amino-ketones** and amino-aldehydes, relation between the absorption spectra and chemical constitution of (BALY and MARSDEN), T., 2108; P., 235.
- acid properties of (RABE, SCHNEIDER, and BRAASCH), A., i, 361.
- transformations of (GABRIEL and LIECK), A., i, 464.
- β -Amino-ketones**, preparation of (KOHN), A., i, 829.
- δ -Amino-ketones** (GABRIEL), A., i, 648.
- ϵ -Amino-ketones** (GABRIEL and COLMAN), A., i, 649.
- Amino-lactones** from diacetone alcohol (KOHN), A., i, 819.
- α -Amino-nitriles**, synthesis of (ZEINSKY and STADNIKOFF), A., i, 770.
- Amino-oximes**, negative substituted (STEINKOPF and BENEDEK), A., i, 1012.
- brominated (STEINKOPF and GRÜNUPF), A., i, 966.
- Ammonia**, synthesis of (WOLTERECK), A., i, 400; ii, 174.
- catalytic synthesis of, from its elements (BRUNEL and WOOG), A., ii, 34; (WOLTERECK), A., ii, 174.
- production of, by bacteria (BERGHAUS), A., ii, 413.
- chemical action of radium emanation on (CAMERON and RAMSAY), T., 984; P., 132.
- Ammonia**, electrical conductivity in systems containing zinc sulphate, water, and (SHUMAKOFF), A., ii, 437.
- liquid, boiling point of (FRANKLIN), A., ii, 34.
- contact oxidation of (ORLOFF), A., ii, 582.
- the unimolecular course of the decomposition of, by the silent discharge (LE BLANC and DAVIES), A., ii, 653; (POHL; LE BLANC), A., ii, 819.
- temperature of dissociation of (WOLTERECK), A., ii, 820.
- distillation of, in presence of magnesium or calcium salts (KOBBER), A., ii, 893.
- apparatus for the quantitative distillation of (KOBBER), A., ii, 776.
- equilibrium of, under pressure (JOST), A., ii, 362, 761; (HABER and LE ROSSIGNOL), A., ii, 362, 819.
- action of, on phosphorus (STOCK and JOHANNSEN), A., ii, 583.
- action of, on phosphorus chloronitride (BESSON and ROSSIER), A., ii, 583.
- microbiochemical formation of, in soil (PEROTTI), A., ii, 124.
- and metals, formation of compounds between (KRAUS), A., ii, 486.
- and urea, Spiro's and Polin's methods of estimating (HOWE and HAWK), A., ii, 426.
- estimation of, in urine (MALPATTI), A., ii, 531; (STEEL and GIES), A., ii, 776; (RONCHÈSE), A., ii, 933.
- nitrate, and nitrite, estimation of, in sea water (RINGER and KLINGEN), A., ii, 320.
- estimation of, in water (RONCHÈSE), A., ii, 320.
- and amines, separation of, by means of boiling absolute alcohol (BERTHEAUME), A., ii, 742.
- Ammonium amalgam** (SMITH), A., ii, 38.
- demonstration of the formation of, by electrolysis of ammonium chloride (SCHROEDER), A., ii, 270.
- Ammonium bases**, problem of the asymmetric synthesis of (E. and O. WEDEKIND), A., i, 258.
- ψ -Ammonium bases**, constitution of (GADAMER; KUNTZE), A., i, 322.
- Ammonium compounds**, optically active, effect of constitution on the rotatory power of (JONES and HILL), T., 295; P., 23.
- resolution of, by means of tartaric acid (JONES), A., i, 257.
- dependence of the velocity of racemisation of, on the nature of the anion (E. and O. WEDEKIND and PASCHKE), A., i, 334.

- Ammonium compounds**, optically active, autoracemisation of (V. HALBAN), A., i, 627.
- mechanism of the autoracemisation of (WEDEKIND and PASCHKE), A., i, 722.
- quaternary, double dissociation of (V. BRAUN), A., i, 627.
- Ammonium salts**, Cain's theory of (HANTZSCH), A., i, 1021.
- quaternary, state of, in solution (WEDEKIND and PASCHKE), A., i, 722.
- experiment with, on soils (EHRENBERG), A., ii, 60, 1068.
- calcium cyanamide, and sodium nitrate, manurial experiments with (WAGNER, HAMANN, and MÜNZINGER), A., ii, 622.
- Ammonium** rhodium bromide and chloride (GUTHRIE and HÜTTLINGER), A., ii, 200.
- chloride (*sal ammoniac*), preparation of pure (HINRICHSSEN), A., ii, 494.
- vapour pressure of (JOHNSON), A., ii, 157; (VAN LAAR), A., ii, 353, 569; (ABEGG), A., ii, 466, 812.
- mercuric chloride, and water at 30°, in equilibrium (MEERBURG), A., ii, 676.
- and dimercuriammonium chloride, double, dissociation of, by water (GAUDECHON), A., ii, 188.
- influence of, on the solubility of barium carbonate, and vice versa (KERNOT, D'AGOSTINO, and PELLEGRIANO), A., ii, 568.
- mercuric chloride (*white precipitate*), reactions of (SCHMIDT and KRAUSS), A., i, 139.
- acidimetric assay of (RUPP and LEHMANN), A., ii, 70.
- chromate, dichromate, and trichromate, slow decomposition of, by heat (BALL), P., 136.
- dichromate, decomposition of, by heat (HOOTON), P., 27.
- chromates, double (GRÖGER), A., ii, 690.
- periodate, specific gravity and solubility of (BARKER), T., 17.
- molybdate, hydrolysis of, in presence of iodates and iodides (MOODY), A., ii, 197.
- cero- and lanthano-molybdates (BARBIERI), A., ii, 595.
- phosphomolybdate, variations in the composition of (CHESNEAU), A., ii, 427.
- nitrate, utilisation of nitrogen in the form of (PFEIFFER, HEPNER, and FRANK), A., ii, 980.
- Ammonium nitrite** (MEYER and TRUTTER), A., ii, 181; (WESCHERIDEN), A., ii, 245.
- sulphate as manure. See under Manure.
- calcium sulphate, double. See Ammonium syngenite.
- copper calcium sulphates (D'ANS), A., ii, 590.
- manganous sulphates (LANG), A., i, 350.
- persulphate, electrolytic production of (CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE), A., ii, 690.
- action of, on metals (TURRENTINE), A., ii, 104; (LEVI, MIGLIORINI, and ERCOLINI), A., ii, 581.
- and sodium peroxide, reaction between (KEMPF and OEHLER), A., ii, 764.
- oxidation of the ammonia in (LEVI and MIGLIORINI), A., ii, 835.
- use of, in the separation of manganese from copper in acid solutions (GOTSCHALK), A., ii, 433.
- thioantimonate (DONK), A., ii, 763.
- Ammonium cyanate** and carbamide, isomerism of (PATERSON and McMILLAN), T., 1050; P., 135.
- thiocyanate and thiocarbamide, isomerism of (PATERSON and McMILLAN), T., 1049; P., 135.
- hydrolysis of aqueous solutions of, in presence of metallic hydroxides (GROSSMANN), A., i, 512.
- Ammonium radicles**, chemical dissociation of polyiodides of (DAWSON), T., 1308; P., 181.
- electrolytic dissociation of polyiodides of (DAWSON and JACKSON), T., 2063; P., 213.
- Ammonium syngenite** (D'ANS), A., ii, 182.
- Amorphous, colloidal, and crystalline states** (V. WEIMARN), A., ii, 90.
- Amygdalin** (ROSENTHALEN), A., i, 197.
- hydrolysis of, by emulsin (AULD), T., 1251, 1276; P., 97, 181; (FEIST), A., i, 437, 903; (ROSENTHALEN), A., i, 817.
- Amyl alcohol**, recovery of, from the acid liquors obtained in the Gether process (RICHMOND), A., i, 495.
- oxidation of, by a contact process (ORLOFF), A., i, 306.
- l-Amyl alcohol**, sulphur derivatives of and their optical activity (HILDITCH), T., 1619; P., 195.
- Amyl alcohol**. See also Dimethylethylcarbinol.
- isoAmyl arsenite** (LANG, MACKAY, and GÖRTNER), T., 1867; P., 150.

- Amyl ether**, preparation of (SCHROETER and SONTAG), A., i, 497.
 compound of, with magnesium methiodide (ZEEWITINOFF), A., i, 616.
Amyl nitrite, effect of, on red blood corpuscles (SLAVU), A., ii, 767.
Amylamine, preparation of (CHEMISCHE WERKE VORM. HEINRICH BYK), A., i, 395.
Amylaminooctal and its derivatives (PAAL and VAN GEMBER), A., i, 511.
Amylase, physicochemical investigation of (PHILOCHE), A., i, 712; ii, 470.
 of pancreatic juice, action of, and its activation by gastric juice (BIERRY), A., ii, 305.
 of resting barley (FORD and GUTHRIE), A., ii, 218.
Amyltri-chlorosilicane (MELZER), A., i, 987.
Amylene alcohol. See Δ^8 -Penten-3-ol ozonide (HARRIES and HAEFFNER), A., i, 846.
Amyglycerol and its triacetate (REIF), A., i, 847.
Amyloid degeneration, the chemistry of (HANSEN), A., ii, 968.
 α -Amyloxystyrene (TIFFENEAU), A., i, 19.
1-Amylpiperidine, γ -amino- and its additive salts, carbamide, phenyl-carbamide, and oxamide (BLAISE and MAIRE), A., i, 398.
 α -Amyrin, identity of, with ilicyl alcohol (JUNGFLEISCH and LEROUX), A., i, 1000.
 cinnamic ester of (WINDAUS and WELSCH), A., i, 903.
Anæmia, experimental, blood formation in spleen and liver in (v. DOMARUS), A., ii, 509.
Anæsthesia, increase in osmotic concentration of the blood during (CARLSON and LUCKHARDT), A., ii, 304.
 ether. See Ethyl ether anæsthesia.
Anæsthetics, local, colour test for (LEMAIRE), A., ii, 784.
Analysis, isolation of traces of mineral substances from saline mixtures in (MEILLERE), A., ii, 62.
 importance of hygroscopy in (REICHARD), A., ii, 891.
 destruction of organic substances in (KERBOSCH), A., ii, 981.
 replacement of hydrogen sulphide in (DONATH), A., ii, 780.
 use of borax, &c., beads in (LUTZ), A., ii, 226.
 addition of indigo in titrations with methyl- or ethyl-orange (LUTHER), A., ii, 62.
Analysis, absorption bulbs for use with bottles containing standard solutions, &c. (Pozzi-Escot), A., i, 729.
 new form of potash bulb for (HILL), P., 182.
 apparatus for testing burettes, pipettes, and mercury measuring tubes, (v. SPINDLER), A., ii, 625.
 gas-generating apparatus for use in (MÜLLER), A., ii, 129.
 apparatus for estimations involving distillation (MORGAN and COOK), A., ii, 424.
 use of certain organic acids and acid anhydrides for the standardisation of acid and alkali solutions (PHELPS and WEED), A., ii, 730.
 comparison between succinic acid, arsenious oxide, and silver chloride for the standardisation of solutions (PHELPS and WEED), A., ii, 730.
 preparation of alcoholic potassium hydroxide solution and apparatus for storing the same (SCHOLL), A., ii, 425.
Analysis, adsorption. See Adsorption analysis.
 new capillary and capillary-analytical investigations (GOPPILSROEDER), A., ii, 529.
 centrifugal qualitative (JANSEN), A., ii, 891.
 chemical, microchemical, and microscopic, use of chloral alcoholate, chloral hydrate, and bromal hydrate solutions in (SCHAER), A., ii, 62.
 electrolytic (CLASSEN), A., ii, 226, 432, 529; (FISCHER), A., ii, 226; (FOENSTER), A., ii, 322, 529; (PERKIN), A., ii, 432.
 use of the filtering crucible in (GOOCH and BEYER), A., ii, 529.
 rapid, of metals (SAND), T., 1572; P., 189.
 microchemical (SCHOORL), A., ii, 432, 777; (BOLLAND), A., ii, 1080.
 organic, soda-lime apparatus for (DENNSTEDT), A., ii, 225.
 organic elementary, new experiences in the simplified method of (DENNSTEDT), A., ii, 321.
 of organic compounds (DENNSTEDT and HASSLER), A., ii, 984.
 qualitative, rapid method of (POL-LARD), A., ii, 1069.
 of the common elements (NOYES, BRAY, and SWEAR), A., ii, 538.
 of metals of the second group without using hydrogen sulphide or ammonium sulphide (SELVATRICI), A., ii, 322.

- Analysis**, qualitative, of group III. (CARON and RAQUET), A., ii, 630.
 use of sodium dioxide in (CARON and RAQUET), A., ii, 630; (CALHANE), A., ii, 635.
 quantitative, use of sodium peroxide in (PARB), A., ii, 628.
 refractometric, of organic mixtures (BEYTHIEN and HENNICKER), A., ii, 72; (SUNDVIK), A., ii, 990.
 spectrum. See under Photochemistry.
 thermal, quartz protecting tubes in (SCHOEN), A., ii, 1015.
 volumetric, preparation of normal hydrochloric acid (REBENSTORFF), A., ii, 221.
 titration of permanganate in presence of hydrochloric acid (HARRISON and PERKIN), A., ii, 228.
 use of sodium hyposulphite in (BOLENDACH), A., ii, 229.
 use of thiosulphuric acid in (CASOLARI), A., ii, 173, 222.
- Anethole**, synthesis of (BEHAL and TIFFENEAU), A., i, 260.
 methyl iodohydrin (TIFFENEAU), A., i, 165.
- Anglesite**, barytes, and celestine, artificial reproduction of, and isomorphous mixtures of these substances (GAUBERT), A., ii, 38.
- Angocopalolic acid** and α - and β -**Angocopaloresens** from Angola copal (TSCHIRCH and RACKWITZ), A., i, 96.
- Anhydride**, $C_{21}H_{30}O_8$, from agaricic anhydride (THOMAS and VOGELSANG), A., i, 5.
- Anhydrides** of α -amino-*N*-carboxylic acids and of α -amino-acids (LEUCHS and GEIGEN), A., i, 541.
 of monobasic acids, action of zinc allyl iodide on (SAYTZEFF), A., i, 73.
 acid, mixed organic, new method of preparing (BOUGAULT), A., i, 791.
 colour reactions during the hydrolysis of (STOBBER), A., i, 985.
 ester, of saturated dibasic acids (MOL), A., i, 76.
 See also Dicarboxylic anhydrides.
- Anhydrobisphenacylamine** and its nitrate and benzylidene derivative (GABRIEL and LIECK), A., i, 465.
- Anhydrobraziliinic acid**, synthesis of (PERKIN and ROBINSON), T., 489; P., 54.
- Anhydro- α '-dimethylhydrophthalide** (MERMOD and SIMONIS), A., i, 342.
- Anhydroglutaric acid**, ethyl ester (MOL), A., i, 77.
- Anhydrohaematic acid**, esters (KÜSTER), A., i, 303.
- Anhydrohydroxydihydrosovic acid** and its salts (RIEDEL), A., i, 501.
- Anhydrolinamic phenol** and its acetate and benzoate (KLOSS), A., i, 904.
- Anhydromethylencitrylsalicylic acid**, quinine salts (SANTI), A., i, 451.
- Anhydro- α -naphthaquinoneseresorcinol**. See Brazanquinone, 2-hydroxy-.
- Anhydro-oxalic acid**, ethyl ester (MOL), A., i, 76.
- Anhydro-oxymethylenediphosphoric acid**, decomposition of, by phytase (SUZUKI, YOSHIMURA, and TAKASHI), A., i, 235.
 salts, occurrence of, in plants (SUZUKI and YOSHIMURA), A., ii, 124.
 calcium magnesium salt. See Phytin.
- Anhydro-*S*-phenetyl-3:3'-dinitrophen-azothionium** (SMILES and HILDITCH), T., 150.
- Anhydrorhapontigenin** (HESSE), A., ii, 419.
- Anhydrosuccinic acid**, ethyl ester (MOL), A., i, 76.
- Anil, chloro-**. See *p*-Benzoquinone, *tetra*-chloro-.
- hydrochloro-. See Quinol, *tetrachloro*-.
- Anilhaematic acid** and its methyl ester (KÜSTER), A., i, 304.
- Anilides**, formation of, from benzhydroxamic acid (PONZIO and GIOVETTI), A., i, 726.
p-toluidides, and α -naphthalides of normal fatty acids, melting points of (ROBERTSON), T., 1093; P., 120.
 of certain polybasic aliphatic and aromatic acids, nitration of *N*-acyl compounds of (TINGLE and BLANCK), A., i, 778, 893.
- Anilides**, halogenated, preparation of (MANNINO and DI DONATO), A., i, 826.
- ψ -**Anilides**, acid anilides, and anilo-acids (MEYER), A., i, 25.
- Aniline** and its derivatives, nitration of (TINGLE and BLANCK), A., i, 778; (WITT and WITTE), A., i, 874.
 action of, on benzoylbenzoic acids (MEYER), A., i, 25.
 action of dichloroacetic acid on (V. OSTROMISLENSKY), A., i, 82, 888.
 and its homologues, action of dichloroacetic acid on (HELLER and LEYDEN), A., i, 216.
 formaldehyde, and sodium hyposulphite, interaction of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 151.
 and its homologues, action of glyoxylic acid and of diacetylglyoxylic acid on (V. OSTROMISLENSKY), A., i, 889.

- Aniline, oxidation of, by halogen acids** (OSTROGOVICH and SILBERMANN), A., i, 278.
- indulines from** (BACOVESCU), A., i, 825.
- acetyl derivative.** See Acetanilide.
- calcium derivative** (ENDMANN and VAN DER SMISSEN), A., ii, 568.
- di-o-substituted, preparation of mono-acetyl derivatives of** (SMITH and ORTON), T., 1249; P., 132.
- picrate** (SUIDA), A., i, 523.
- and o-nitro-** (VIGNON and ÉVIEUX), A., ii, 604.
- m-nitro-** (GIBSON), T., 2100; P., 242.
- styphnate, m-nitro-** (GIBSON), T., 2100; P., 241.
- Aniline, 2:6-dibromo-, preparation of** (ORTON and PEARSON), T., 735.
- 2:5-dichloro-, reactivity of diazo-salts of** (ROHNER), A., i, 482.
- chloronitro-, new (v. OSTROMISSEN-SKY), A., i, 868.**
- 2:6-diiodo-, and 2:3:6- and 2:4:5-tri-iodo-** (KÖRNER and BELASIO), A., i, 779.
- m-nitro-, action of bromine or of sodium hypobromite on, and some of its halogen derivatives** (KÖRNER and CONFARDI), A., i, 523.
- iodination of** (KÖRNER and BELASIO), A., i, 778.
- p-nitro-, chlorination of** (FLÜRSCHHEIM), T., 1772; P., 211.
- o- and p-nitro-, melting points of mixtures of** (TINGLE and ROLKER), A., i, 974.
- o-, m-, and p-nitro-, melting point curves of binary mixtures of, and a new method of determining the composition of such mixtures** (TINGLE and ROLKER), A., i, 408.
- solubility of, in alcohol** (TINGLE and ROLKER), A., i, 974.
- reactions of, with phenylcarbimide** (MICHAEL and COBB), A., i, 949.
- synthesis of piperazine and pyrrole derivatives from** (BORSCHKE and TITSINGH), A., i, 103.
- mercury salts of** (JACKSON and PEAKES), A., i, 523.
- 2:4:6-trinitro-** (WITT and WITTE), A., i, 875.
- Aniline-black, constitution of** (MARSDEN), A., i, 226.
- Aniline colours, absorption of light in solutions of, from the standpoint of optical resonance** (KALANDER), A., ii, 139.
- Anilines, bromo-, substituted, orientation of a series of** (HILL), A., i, 256.
- Aniline-p-sulphonic acid** (*Sulphanilic acid*), amides of (GELMO), A., i, 409.
- Anilinosacetal** (WOHL and LANGE), A., i, 17.
- γ -Anilinoacetoacetic acid, o-cyano-ethyl ester, and its hydrochloride** (BENARY), A., i, 601.
- Anilinosaceto-p-hydroxyanilide, p-hydroxy-, and its hydrochloride** (HINSBERG), A., i, 453.
- Anilinobenzoxazole and its acetyl derivative** (YOUNG and DUNSTAN), T., 1082; P., 136.
- Anilinodihydrobenzoxazole.** See s-Diphenylcarbamide.
- N-Anilinodihydrophenazine, 1:3-dinitro-N-dinitro-** (LEHMANN and GRANDMOUGIN), A., i, 478.
- 4-Anilinodiphenyl, 3-amino-, and its derivatives** (DZURZYNSKI), A., i, 692.
- β -Anilinoethyl ethyl ketone and its semicarbazone and phenylcarbamide** (BLAISE and MATRE), A., i, 566.
- β -Anilinoethyl propyl ketone and its phenylcarbamide** (BLAISE and MATRE), A., i, 566.
- 3-Anilino-6-hydroxyphenylisophtalphenazonium chloride** (KEHEMANN and BRUNEL), A., i, 579.
- 4-Anilino-1-indoxylbenzene** (FRIEDLÄNDER and SCHULOFF), A., i, 675.
- Anilinoethylcarbinol and its hydrochloride and picrate** (FARBWERN, VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 413.
- Anilinoethyleucomophthalic acid, ethyl ester** (DIECKMANN and MEISER), A., i, 895.
- s-Anilinophenosafraanine, phenylated, synthesis of, and its additive salts** (BARBIER and SISLEY), A., i, 64.
- Anilinoquinoline, nitro- and nitroamino-derivatives and their additive salts and acetyl derivatives** (MEIGEN, GARES, MEKELBACH, and WICHERS), A., i, 580.
- 3-Anilinetoluenes, 4-nitro-** (BORSCHKE, WITTE, and BOTHE), A., i, 367.
- 6-Anilino-2-o- and -p-toluidinepyrimidines** (JOHNSON, STOREY, and MCCOLLUM), A., i, 838.
- 6-Anilino-2-p-tolyl-4-methylpyrimidine** (JOHNSON, STOREY, and MCCOLLUM), A., i, 838.
- Anilinetriphenylamine and p-amino- and p-chloro- and their acetyl derivatives, and p-nitro-** (GAMBANJAN), A., i, 1016.
- Anilo-acids, acid anilides, and ψ -anilides** (MEYER), A., i, 25.
- ψ -Anilopyrine, 4-nitroso-, and its hydrochloride** (MICHAELIS and MIELECKE), A., i, 61.

- Animal fibres**, reducing action of (ULICH and SCHMIDT), A., i, 372.
- Animals**, chemico-physical studies of (BOTTAZZI), A., ii, 869; (BORTAZZI, RUDOLIA, and JAFFELLI), A., ii, 870.
- inosite** in (ROSENBERGER), A., ii, 873.
- estimation of lactic acid** in (JERUSALEM), A., ii, 905.
- metabolism**. See under Metabolism.
- tissues**. See Tissues.
- Animals**, effects of variations in inorganic salts and reaction on (MOORE, ROAF, and KNOWLES), A., ii, 768.
- origin and destiny of cholesterol** in (DORÉE and GARDNER), A., ii, 514.
- nucleic acids** in (SCHMIEDEBERG), A., i, 70.
- protein synthesis** in (HENRIQUES), A., ii, 207.
- growing, calcium foods** in (ARON and SEBAUER), A., ii, 208; (ARON and FRESE), A., ii, 405; (ORGLER), A., ii, 606, 872.
- Anions**. See under Electrochemistry.
- Anisaldazine**, viscosity of (BOSE and CONRAT), A., ii, 258; (BOSE), A., ii, 1017.
- Anisaldehyde** hydrogen persulphide (BRUNNER and VULLEUMIER), A., i, 900.
- p-Anisic acid** (*p*-methoxybenzoic acid), ϵ -bromoamyl ester (MERCK), A., i, 419.
- p-Anisic acid**, chloroimino- and imino-esters (HILFERT), A., i, 831.
- o-Anisidine**, 3-nitro-, and its acetyl derivative (BLANKSMA), A., i, 978.
- p-Anisidinesulphonic acid**, chloro-, azo-derivative of (AKTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 1023.
- Anisine**, resolution of the iminazole ring in (FISCHER and PRAUSE), A., i, 219.
- Anisoin**, alkylation of (IRVINE and MCCNICOLL), T., 1605; P., 191.
- Anisole**, sulphination of (SMILES and LE ROSSIGNOL), T., 755.
- Anisole**, ω -bromodinitro-, ω -chlorodinitro-, and ω -dinitro-, and its phenylhydrazine salt (PONZIO and CHARRIER), A., i, 522.
- 2-cyano-, nitro- and nitroamino-derivatives** of (BLANKSMA), A., i, 271.
- 3- and 4-nitro-2-cyano-, and 4:6-dinitro-2-cyano-** (BLANKSMA), A., i, 978.
- Anisoleulphinic acid**, preparation of (KNOEVENAGEL and KENNER), A., i, 971.
- α -Anisyl- β -phenylhydrazine**, α -nitro- β -nitro- (PONZIO and CHARRIER), A., i, 532.
- Anisyl sulphoxide** (SMILES and LE ROSSIGNOL), T., 755.
- Anisylacetone**, isonitroso- (PONZIO and GIOVETTI), A., i, 835.
- γ -Anisylbutyric acid**, α -hydroxy- and β -iodo- α - β -hydroxy-, lactone of (BOUGAULT), A., i, 539.
- Anisylchloroisopropyl alcohol**, preparation of (FOURNEAU and TIFFENEAU), A., i, 163.
- β -Anisylcinnamic acid**, stereoisomeric, and their esters and salts (STOERMER and FRIDERICI), A., i, 179.
- γ -Anisylisocrotonic acid**, α -hydroxy- (BOUGAULT), A., i, 269, 539.
- α -Anisylethylamine** and its salts (BUSCH and LERFHELM), A., i, 158.
- Anisylidene chloride** (SCHMIDT), A., i, 654.
- Anisylideneacetone** hydrochlorides (FRANCESCONI and CUSMANO), A., i, 803.
- Anisylideneacetyl-1-naphthol**. See Methoxybenzylideneacetyl-1-naphthol.
- p-Anisylideneaminodimethylaniline** and its hydrochlorides (MOORE and GALE), A., i, 369.
- Anisylideneaniline** hydrochloride (POPE and FLEMING), T., 1916.
- Anisylideneclnamylideneacetone** and its hydrochlorides and bromides (FRANCESCONI and CUSMANO), A., i, 802.
- Anisylidenemethylhydrazine**, benzoyl derivative of (MICHAELIS and HADANCK), A., i, 1020.
- Anisylidene- α -naphthylamine** and its hydrochloride (POPE and FLEMING), T., 1916.
- Anisylidenepyruvic acid** (BOUGAULT), A., i, 269.
- iodo-lactone** from (BOUGAULT), A., i, 539.
- 1-Anisyl-2-methylbenzimidazoles**, *o*-, *m*-, and *p*-, 4:7-dinitro- β -hydroxy, and their salts and derivatives (MELDOLA and HAY), T., 1674.
- β -o-Anisyl- α -methylcinnamic acids**, stereoisomeric (STOERMER and FRIDERICI), A., i, 181.
- Anisylmethylfurazan**, chloro- (WIELAND and SEMPER), A., i, 108.
- β -Anisyl- α -methyl- β -phenylhydracrylic acid**, ethyl ester (STOERMER and FRIDERICI), A., i, 181.
- Anisylisoxaline**, isonitroso-, and its benzoyl and methyl derivatives (WIELAND and SEMPER), A., i, 109.

- 1-Anisylpiperidine and its picrate (KOENIGS and BECKMANN), A., i, 284.
- α -Anisylpropylamine and its derivatives (BUSCH and FICKELHEIM), A., i, 153.
- Anisylsulphone (SMITHS and LE ROSSIGNOL), T., 755.
- γ -Anisylvaleric acid, β -iodo- γ -hydroxy-, lactone of (BOUGAULT), A., i, 538.

- preparation of a compound having the composition of (KALLE & Co.), A., i, 980.
- Benzyl arsenite (LANG, MACKAY, and GORTNER), T., 1370; P., 151.
- bromide, 3:5-dibromo- (WHEELER and CLAPP), A., i, 897.
- 4-bromo-*p*-hydroxy-, condensation products of, with aromatic bases (AUWERS and DOMBROWSKI), A., i, 333.
- p*-nitro-, interaction of, with isonitrosocamphor in presence of silver oxide (FORSTER and HOLMES), T., 250; P., 8.
- chloride, *p*-nitro-, interaction of, with isonitrosocamphor in presence of sodium ethoxide (FORSTER and HOLMES), T., 248; P., 8.
- o*- and *p*-nitro-, condensation of, with acetylacetone (MECH), A., i, 656.
- cyanide. See Phenylacetonitrile.
- ether, α -dichloro-2:2'-dinitro- (KLIEDL), A., i, 82.
- methyl ether (Bacon), A., i, 815.
- Benzyl cyanohydrin isomerism of (HINCHER), A., i, 207.
- sodium thiosulphate, *m*-, and *p*-nitro-, and the action of alkalis on (FRICK and TWISS), T., 1403; P., 185.
- sulphoxide, a possible example of dynamic isomerism (SMYTHE), P., 285.
- Benzylacetic acid, 3:5-dibromoamino-, *N*-phthalyl derivative of (WHEELER and CLAPP), A., i, 898.
- α -Benzylacetone, α -amino-, and its additive salts (SONN), A., i, 55.
- Benzylacetonephenylhydrazones (SCHLENK), A., i, 738.
- N*-Benzylaldoxime, molecular rearrangement of (KUHARA), A., i, 900.
- Benzylaminoacetal and analogues (RÜCHNER and SCHÖN), A., i, 153.
- 4-Benzylaminotoluene, 3:5-dinitro-, preparation of (ULLMANN), A., i, 627.
- Benzylanilines, alkylated, derivatives of (GNEHM and SCHÖNOLZER), A., i, 112.
- Benzylanilopyrines, 2- and ψ -, and their derivatives (MICHAELIS, MIELEKE, and LUTZE), A., i, 62.
- 4-Benzylantipyryne, α -hydroxy- (MICHAELIS and ENGELHARDT), A., i, 912.
- Benzylarsine and its platinumchloride (DEHN and WILLIAMS), A., i, 721.
- 1-Benzylbenzopyrazolone and its additive salts (MILRATH), A., i, 104.
- β -Benzyl-*n*-butyl alcohol and its acetate (GUERBER), A., i, 636.
- β -Benzylisobutylcarbinol and its acetate (GUERBER), A., i, 636.
- Benzylchloroisopropyl alcohol (FOURNEAU and TIFFENEAU), A., i, 163.
- Benzyltrichlorosilicane (MELZER), A., i, 967.
- N*-Benzylidiacetoneitrile (v. MEYER and SCHUMACHER), A., i, 909.
- Benzylidihydrothymine, *p*-5-dinitro-4-hydroxy- (JOHNSON and DERRY), A., i, 1019.
- 3-Benzyl-4:7-dimethylcoumarin (FRIES and KLOSTERMANN), A., i, 822.
- 5-Benzylethylamino-2-benzeneazophenotol-, -phenol, and -4-*p*-toluenazophenol (BÜLOW and SPROESSER), A., i, 583.
- 5-Benzylethylamino-2:4-bis-benzeneazophenol and -*p*-toluenazophenol (BÜLOW and SPROESSER), A., i, 583.
- 7-Benzylethylamino-4-mono- and -3:4-dimethylcoumarins (BÜLOW and SPROESSER), A., i, 272.
- 5-Benzylethylamino-2- α -naphthalenazophenol (BÜLOW and SPROESSER), A., i, 583.

- Benzylethyl-*p*-aminophenol, interaction of, and its salts and ethylether, condensation with esters of ketocarboxylic acids (BÜLOW and SPROESSER), A., i, 272.
- primary bisazo-compounds of (BÜLOW and SPROESSER), A., i, 583.
- 5-Benzylethylamine-2-*p*-sulphobenzene-*azophenol* and -2-*p*-toluenesulphophenol (BÜLOW and SPROESSER), A., i, 588.
- Benzylethylaniline, *m*-amino-, acetyl derivative of, and *p*-hydroxy- (GNEHM and SCHÖNHOLZER), A., i, 112.
- Benzylethylanilinesulphonic acid and its salts and nitroso-derivative (GNEHM and SCHÖNHOLZER), A., i, 112.
- Benzylethylisobutylsilicic acid and its chloride and oxide, synthesis of (LUFF and KIPPING), T., 2006; P., 224.
- Benzylethylidipropylsilicane and its sulphonation (MARSDEN and KIPPING), T., 198; P., 12.
- 6-Benzylethyl-*p*-phenylenediamine, sulphate of (GNEHM and SCHÖNHOLZER), A., i, 112.
- 7-1-Benzyl-1-ethyl-2-and-3-pipecolinium salts (SCHOLTZ), A., i, 679.
- Benzylethylisobutylsilicic oxide and its sulphonation (MARSDEN and KIPPING), T., 198; P., 12.
- Benzylethylsilicon dichloride, preparation of (LUFF and KIPPING), T., 2005.
- Benzylethylsilicone (ROBISON and KIPPING), T., 439; P., 25.
- Benzylglucoside (BLANKSMA and ALBERDA VAN EKENSTEIN), A., i, 952.
- 3-Benzylhexahydroanthracene, preparation of (GORDON), A., i, 16.
- Benzylhydrazine, action of nitrous esters on, in alkaline solution (STOLLE), A., i, 917.
- 3-Benzylhydroxylamine, interaction of, with ketones (SCHEIBER), A., i, 763; (SCHEIBER and BRANDT), A., i, 764.
- Benzylideneacetone and its hydrochlorides (FRANCESCONI and CUSMANO), A., i, 803.
- aminopyrrolidone derivatives from (KOHN), A., i, 829.
- Benzylideneacetophenone, 2-hydroxy-, action of hydrochloric acid on (PERKIN, ROBINSON, and TURNER), T., 1110.
- Benzylidene- α -amines, action of magnesium organic compounds on (BUSCH and LEEFHELM), A., i, 153.
- Benzylideneamino- α -alkylcinnamic acids, substituted, esters, relation between constitution of and capacity for forming liquid crystals (VORLÄNDER and KÄSTER), A., i, 641.
- Benzylideneaminodimethylaniline, and its hydrochlorides (MOORE and SARR), A., i, 369.
- Benzylidene-1-amino-2-naphthal, nitro-, hydrochloride of (POPE and FLEMING), T., 1918.
- Benzylidene-4-amino- α -naphthol, nitro- (POPE), T., 536.
- Benzylidene-*p*-aminophenol hydrochloride and *o*- and *p*-nitro-, and their hydrochlorides (POPE and FLEMING), T., 1915.
- Benzylidene-*o*- and -*p*-aminophenol, and *m*- and *p*-nitro- (POPE), T., 535; P., 24.
- Benzylidene-*p*-aminophenylarsinic acid, *p*-hydroxy- (KURATORIUM DER GEORG & FRANZISKA SPEYERSCHEN STUDIENGESellschaft), A., i, 747.
- Benzylidene-5-aminosalicylic acid, nitro- (POPE), T., 534.
- Benzylideneaniline, *o*-hydroxy-, and its *m*'- and *p*'-nitro-derivatives (POPE), T., 535; P., 24.
- and its *p*'-nitro-derivative, hydrochlorides of (POPE and FLEMING), T., 1916.
- trihydroxy- (GATTERMANN), A., i, 31.
- Benzylidene-*o*-anisidine, *p*-nitro-, and its hydrochloride (POPE and FLEMING), T., 1917.
- Benzylidene-*p*-anisidine hydrochloride and *p*-nitro-, and its hydrochloride (POPE and FLEMING), T., 1915.
- Benzylidenecarbamidoxime and its nitro-derivatives (CONDUCHÉ), A., i, 155.
- Benzylidenecinnamylideneacetone and its hydrochloride (FRANCESCONI and CUSMANO), A., i, 802.
- Benzylidenedimalonic acid and *o*-nitro-methyl esters (MEERWEIN), A., i, 546.
- Benzylidenemethylhydrazine, benzoyl derivative of (MICHAELIS and HADANCK), A., i, 1020.
- Benzylidenemethyl isopropyl ketone, reactions of, and its dibromide (DIECKMANN and KRON), A., i, 389.
- Benzylidenemethylsemicarbazide (MICHAELIS and HADANCK), A., i, 1020.
- Benzylidenemethylsilicic acid and its phenylhydrazine (WINZHEIMER), A., i, 805.
- Benzylidene- α -naphthylamine, *o*-hydroxy-, and its hydrochloride (POPE and FLEMING), T., 1916.
- Benzylidene- β -naphthylamine, action of ethyl oxalacetate on (SIMON and MARGUIN), A., i, 296.
- Benzylidene-*p*-phenetidine hydrochloride and its nitro-derivatives and their hydrochlorides (POPE and FLEMING), T., 1916.

- Benzylidenepiperonylideneacetone hydrochloride** (FRANCKOOST and CHUMAKO), A., i, 803.
- Benzylidenquinone, tetrabromohydroxy-, and tetrachlorohydroxy-** (ZINCKE and BIRSCHEL), A., i, 782.
- Benzylidenevinylideneacetoneamine and its hydrochloride** (PAULY and RICHTER), A., i, 286.
- Benzylmalonic acid, 3:5-dibromoamino-, N-phthalyl-derivative** (WHEELER and CLAPP), A., i, 898.
- Benzylmethylaniline, m-amino-, and its acetyl derivative, p-hydroxy-, and m-nitro-** (GNEHN and SCHÖNHOLZER), A., i, 113.
- Benzylmethylanilinesulphonic acid and its salts and nitroso-derivative** (GNEHN and SCHÖNHOLZER), A., i, 113.
- 1-Benzyl-2-methylbenzopyrazolone** (MILRATH), A., i, 1014.
- Benzylmethylglyoxaline, 4:5- or 5:4-, and its additive salts and mercaptan** (SONN), A., i, 56.
- Benzylmethyl-p-nitrosoaniline and its hydrochloride** (GNEHN and SCHÖNHOLZER), A., i, 112.
- α -Benzylmethyl-p-phenylenediamine and its sulphate** (GNEHN and SCHÖNHOLZER), A., i, 112.
- 3-Benzyl-1-methylthymine** (JOHNSON and DERBY), A., i, 1019.
- 3-Benzyl-1-methylaracil and 5-bromo-** (JOHNSON and DERBY), A., i, 1018.
- Benzylloxide, sodium, action of alcohols on** (GUERRET), A., i, 162, 635.
- Benzylloxybenzene-p-sulphonic acid, sodium salt** (SCHULTZ and ICHEN-HAEUSER), A., i, 230.
- Benzyl α -phenyl- β -benzyl- γ -benzylidenepropyl ketone** (REIMER and KEYNOLDS), A., i, 989.
- Benzylphosphinic acid, hydroxy-, aniline salt** (VALLÉE), A., i, 976.
- Benzylphthalimide, 3:5-dibromo-** (WHEELER and CLAPP), A., i, 898.
- 1-Benzylpiperidine, p-hydroxy-, and its dibromo-derivative and their hydrobromides** (KOENIGS and BEHNHART), A., i, 285.
- α -Benzylpropionic acid, ethyl ester** (DIECKMANN and KRON), A., i, 389.

 blood gases, effect of hirudin on (BARCROFT and MINES), A., ii, 117.
 blood pigment (MARCHLEWSKI and RETTINGER), A., i, 282; (MARCHLEWSKI), A., i, 843.
 blood pigments, action of certain oxidising agents on (MACWILLIAM), A., ii, 585.
 blood plasma of oxen, behaviour of certain polypeptides towards (ABDERHALDEN and McLESTER), A., ii, 511.
 blood platelets, decomposition of, blood coagulation, and muscle coagulation (BÜRKE), A., ii, 510.
 of the ox, behaviour of certain polypeptides towards (ABDERHALDEN and MANWARING), A., ii, 510.
 blood pressure, duration of effect of pituitary extract on (MUMMERY and SYMES), A., ii, 767.
 blood-serum, hemosoic value of (McCAY), A., ii, 403.
 action of resorbed salicylic acid in (JACOBY), A., ii, 512.
 of different marine and terrestrial animals, viscosity of (BOTTAZZI), A., ii, 869.
 variations of electrical conductivity, viscosity, and surface tension of, during dialysis (BOTTAZZI, BUGLIA and JAPPELLI), A., ii, 870.
 of various animals, content of protein nitrogen in the (BOTTAZZI), A., ii, 869.
 See also Serum.
 boat funnel. See Funnel.
 body, animal, are there reducing ferments in the? (HEFFTER), A., ii, 1054.
 boiling point method, sources of error in the, and attempts to remove them (BECKMANN, LIESCHE, and KLOFFER), A., ii, 663; (BECKMANN), A., ii, 1014.
 boiling points and freezing points of concentrated aqueous solutions and the question of the hydration of the solute (JOHNSTON), A., ii, 661.
 and melting points of aromatic sulphides, selenides, and tellurides, and their halogen additive compounds (LYONS and BUSH), A., i, 417.
Boletus edulis, preparation of pure chitin from (SCHOLL), A., ii, 1065.

- Bomb.** Berthelot-Mahler, modification of the platinum vessel of the (TÖTH), A., ii, 664.
- Emblesterol** from chrysalidene oil (MENOZZI and MORESCHI), A., i, 241.
- and its esters and dibromo-derivative from the chrysalis of *Bombyx Mori* (MENOZZI and MORESCHI), A., i, 265.
- Bone**, influence of strontium on the growth and composition of (STOELTZNER), A., ii, 769.
- Bone dust**, manuring with (UCHIYAMA), A., ii, 128.
- Bone marrow**, chemistry of (NERKING), A., ii, 516.
- Bone phosphates**, behaviour of, in soil (MONTANARI), A., ii, 128.
- Books**, gift of, from Sir Henry E. Roscoe, P., 278, 289.
- Boric acid and anhydride.** See under Boron.
- Borides.** See under the various metals.
- Borneol**, new (ASCHAN), A., i, 428.
- Borneol**, direct transformation of, into campholic and isocampholic acids (GUERRET), A., i, 661.
- Bornyl borate**, preparation of (VEREINIGTE CHININFABRIKEN ZIMMER & CO.), A., i, 351.
- ethoxyacetate (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 429.
- palmitate (v. SOBBE), A., i, 555.
- Bornyl acetate**, preparation of (CHEMISCHE FABRIK VON HEYDEN), A., i, 351.
- esters of fatty acids, preparation of (CHEMISCHE FABRIK VON HEYDEN), A., i, 351, 809.
- oxalate, preparation of (BASLER & CO.), A., i, 429.
- Boron**, so-called crystalline (BILTZ), A., ii, 762.
- the ultimate rays of (DE GRAMONT), A., ii, 645.
- Boron nitride**, preparation of (STOCK and HOLLE), A., ii, 687.
- trioxide (*boric anhydride*), action of aluminium powder on (WESTON and ELIAS), A., ii, 385.
- Boric acid**, origin of, in the soffioni of Tuscany (NASINI), A., ii, 862; (D'ACCHIARDI), A., ii, 955.
- in the fumaroles of Vesuvius (LACROIX), A., ii, 766.
- detection of, in foods (MANNICH and PRIESS), A., ii, 429.
- detection of, in foods by means of turmeric paper (LAVALLE), A., ii, 896.
- Boron**.
- Boric acid**, detection and estimation of, in foods (v. GAUGERSON), A., ii, 906.
- Boron sulphide**, synthesis of (HOFFMANN), A., ii, 687.
- Boron thiocyanate** (COCKSEDE), T., 2177; P., 270.
- Boron minerals**, two new, of contact metamorphic origin (KNOFF and SCHALLER), A., ii, 507.
- "Bourgeou." See *Panicum stagninum*.
- Boyle-Mariotte law**, application of a deduction from the (REBENSTORFF), A., ii, 565.
- Brain**, human, composition of, at different ages (KOCH and MANN), A., ii, 307.
- of birds and fishes, chemistry of the (ARCTIS), A., ii, 965.
- material in the, which unites with tetanus toxin (TAKAKI), A., ii, 521.
- behaviour of, the, towards strychnine (SANO), A., ii, 974.
- Brass**, analysis of (SCHÜRMANN and ARNOLD), A., ii, 898.
- Brasses**, electrolytic corrosion of, in synthetic sea-water (LINCOLN and BARTELLS), A., ii, 1039.
- Brassica Rapa* var. *rapifera*, essential oil of (KUNTZE), A., i, 196.
- Brazen** from naphthalene, and 2-hydroxy-, and its acetyl derivative (v. KOSTANECKI and LAMPE), A., i, 671.
- Brazaquinone**, 2-hydroxy- (*anhydro- α -naphthaquinone-resorcinol*) (v. KOSTANECKI and LAMPE), A., i, 672.
- Brazaquinones** (v. KOSTANECKI and LAMPE), A., i, 907.
- Brazilein** and its derivatives (ENGELS, PERKIN, and ROBINSON), T., 1115; P., 148.
- methylation of (ENGELS, PERKIN, and ROBINSON), T., 1131.
- Brazilic acid**, constitution of (PERKIN and ROBINSON), T., 502.
- Brazilin** and hematoxylin and their derivatives (ENGELS, PERKIN, and ROBINSON), T., 1115; P., 148.
- constitution of (PERKIN and ROBINSON), T., 489; P., 54.
- Brazillic acid**, synthesis of (PERKIN and ROBINSON), T., 489; P., 54.
- Bromal hydrate**, use of, in chemical, microchemical, and microscopic investigations (SCHAER), A., ii, 62.
- Bromates**, **Bromic acid**, and **Bromides**. See under Bromine.
- Bromination** (COHEN and CROSS), A., i, 413; (ACREE, JOHNSON, and NIDLINGER), A., i, 413; ii, 29.
- by means of diazobenzene perbromides (BÜLOW and SCHMACHTENBERG), A., i, 743.

- Bromine**, preparation of, by Kossuth and Mehner's method, the formation of magnesium oxychloride by electrolysis of the residual solutions from the manufacture of potassium chloride, and its importance for the (HOF), A., ii, 946.
- electrolytic conductivity of, in nitrobenzene solution (BRUNER), A., ii, 149.
- substitution of, by chlorine in the animal body (BÖNINGER), A., ii, 208.
- physiological action of (TOGAMI), A., ii, 872.
- Hydrobromic acid** (*hydrogen bromide*), liquid, heat of vaporisation of (ELLIOTT and MCINTOSH), A., ii, 334.
- Bromides**, behaviour of, in the human and animal organisms (v. WYSS), A., ii, 875.
- excretion of, by the kidney (HALE and FISHMAN), A., ii, 611.
- delicate test for, alone or in solution with chlorides (JAMIESON), P., 144.
- Bromic acid**, study of the oxidation phenomena produced by (BAUBIGNY), A., ii, 577.
- and iodic acid, estimation of, by means of thiosulphuric acid (CASOLARI), A., ii, 222.
- Bromates**, chlorates, iodates, and periodates, estimation of, by means of formaldehyde, silver nitrate, and potassium persulphate (BRUNNER and MELLET), A., ii, 222.
- Bromine**, chlorine, and iodine, separation of, by means of hydrogen peroxide in acid solution (JANNASCH), A., ii, 730.
- See also Halogens.
- Bromine absorption** of unsaturated compounds, apparatus for the determination of the (CROSSLEY and RENOUF), T., 648.
- α -Bromo-fatty acids**, fission of hydrogen cyanide from amides of, and formation of aldehydes or ketones from (MOSSLER), A., i, 133.
- action of zinc or magnesium on mixtures of esters of oxalic acid and of (BASSOW and BAUER), A., i, 316.
- Bromoinmino-acids**, esters, stereoisomeric (HILPERT), A., i, 823.
- Bromo-**. See also under the parent Substance.
- Bronzes**, old, physico-chemical investigation of, from the excavations in Lalajants, on the S.W. shore of Lake Gontscher in the summer of 1906 (SKINDER), A., ii, 381.
- Bronzes**, analysis of (SCHÜRMANN and ARNOLD), A., ii, 898.
- "Brostenite"**, analyses of (BUTURKANT), A., ii, 955.
- Brownian motion** and osmotic pressure (DUCLAUX), A., ii, 760.
- influence of the medium on (HENRI), A., ii, 760.
- Brucine**, new method of oxidising (LEUCHS), A., i, 563.
- iodine derivative of (BURACZEWSKI and KOZNIIEWSKI), A., i, 1007.
- Brucinonic acid** and its ethyl ester (LEUCHS), A., i, 563.
- Buddleia foliata*, oil from the leaves and flowers of (SCHIMMEL & Co.), A., ii, 668.
- Bulbs**, absorption. See under Analysis.
- Bunsen flame**, internal friction and density of the (BECKER), A., ii, 1597.
- luminosity of the (LACY), A., ii, 1033.
- apparatus for producing colorations in a (SCRIBA), A., ii, 647.
- Burette**, circulation (MÜLLER), A., ii, 626.
- gas, new form of (HILL), T., 1357; P., 210.
- automatic safety (MÜLLER and BERCHEM), A., ii, 775.
- a shortened (TSCHAPLOWITZ), A., ii, 981.
- Burettes**, gas, a combined stopcock and capillary connecting tube for (HILL), P., 95.
- Burette clamp**, new (MÜLLER), A., ii, 1069.
- Burseracin** and its effects (v. BOLTON), A., i, 436.
- α -Butadiene- α , β -dicarboxylic acid**. See Muconic acid.
- Butaldehyde**, chloro-, palladium compound (MAKOWKA), A., i, 328.
- iso*Butaldol, crystalline polymeride of (MUSSELIUS), A., i, 761.
- Butane**, physical properties of (LEBEAU), A., i, 749.
- Butane**, α , β -tribromo- (LESPIEAU and PARISELLE), A., i, 496.
- iso*Butane, physical properties of (LEBEAU), A., i, 749.
- boiling point of (NOYES), A., i, 305.
- cyclo*Butane derivatives, transformation of, into cyclopropane derivative (DEMJEANOFF), A., i, 85.
- cyclo*Butanecarboxylic acid and its amide, chloride, and urethane (ZELINSKY and GUTT), A., i, 14.
- hydrogenation of (KIJNER), A., i, 532.
- Butanedicarboxylic acids**. See Adipic acid and *iso*Propylmalonic acid.
- Butane- α , γ , γ -tetracarboxylic acid**, δ hydroxy- (SIMONSEN), T., 1761.

- cyclo*Butanol and its reactions (ZELINSKY and GUTT), A., i, 14.
 some transformations of (DEMJANOFF and DOJARENKO), A., i, 158.
 Butanone. See Methyl ethyl ketone.
*cyclo*Butanone and its nitrosite (DEMJANOFF), A., i, 329.
*cyclo*Butene, constitution of (ZELINSKY and GUTT), A., i, 14; (WILLSTÄTTER and BRUCE), A., i, 402.
 Butenoic acid. See Crotonic acid.
 $\Delta\alpha$ -Butenoic acid, $\alpha\beta$ -dibromo- γ -hydroxy- (LESPIEAU and VIGUIER), A., i, 125.
 $\Delta\alpha$ -Buten-3-ol, β -bromo-, and its acotin, and $\alpha\alpha\beta$ -trido-, and its acetate (LESPIEAU and PARISELLE), A., i, 496.
 $\Delta\alpha$ -Buten- γ -ol (α -methylallyl alcohol) (WOHL and LOSANITSCH), A., i, 934.
 Butinol and its phenylurethane (LESPIEAU and PARISELLE), A., i, 496.
 Butenyl alcohols. See $\Delta\alpha$ -Butenols.
 Butter, detection of benzoic acid in (HÄLPHEN), A., ii, 906; (ROBIN), A., ii, 1078.
 detection of the unsaponifiable ingredients of cacao-butter in (MATTHES and ACKERMANN), A., i, 637.
 Butter-fat, estimation of the caprylic (octoic) acid value of (DONS), A., ii, 288.
 Butterfly pupæ, influence of the amount of carbon dioxide in the respired air on the changes in weight of (V. LINDEN), A., ii, 605.
 Butyl alcohol. See Trimethylcarbinol.
*iso*Butyl alcohol, isomeric change of, effected by nitrous acid (HENRY), A., i, 2.
 thermodynamics of mixtures of water and (BOSE and CLARK), A., ii, 84.
 oxidation of, by a contact process (ORLOFF), A., i, 306.
*iso*Butyl arsenite (LANG, MACKEY, and GORTNER), T., 1367; P., 150.
 cuprocyanide (GUILLEMAUD), A., i, 720.
 $\Delta\alpha$ -Butylacetoacetic acid, ethyl ester (CLARKE), A., i, 593.
*cyclo*Butylamine (ZELINSKY and GUTT), A., i, 14.
 Butylaminoacetal and its derivatives (PAAL and VAN GEMMER), A., i, 511.
 β -Butyl- α -camphoramic acid (FREYRON), A., i, 861.
*iso*Butylcarbimide and its metallic salts (ANSCHÜTZ), A., i, 327.
*cyclo*Butylcarbinol and its isomerisation to pentamethylene derivatives (DEMJANOFF), A., i, 85.
*iso*Butylcarbylamine (GUILLEMAUD), A., i, 719.
 β -Butylsuccinamic acid (SCHRÖTER and BUCHHEITZ), A., i, 119.
*cyclo*Butyldimethylcarbinol, transformations of (KIJNER), A., ii, 530.
 isomeric changes in the transformations of (KIJNER), A., i, 864.
 Butylene, dibromo- (LESPIEAU and PARISELLE), A., i, 496.
*iso*Butylene $\alpha\beta$ -oxide (RIEDEL), A., i, 956.
 sec.-Butylidenequinone, penta- and hexabromo- (ZINCKE and GOLDEMAN), A., i, 781.
 sec.-Butylmalonic acid, α -bromo- (ERLICH), A., i, 396.
n-Butylnaphthalenes, α - and β -, and their picrates (BARGELLINI and MELACINI), A., i, 775.
*iso*Butylnaphthalenes, α - and β -, preparation of (DARZENS and ROST), A., i, 411.
p-sec.-Butylphenol, ψ -bromides and quinones of (ZINCKE and GOLDEMAN), A., i, 780.
*iso*Butylthiocarbamic acid, derivatives and salts of (ANSCHÜTZ), A., i, 327.
*iso*Butyramide, α -amino- (FRANCHIMONT and FRIEDMANN), A., i, 509.
*iso*Butyranilide, imide chloride of (STAUDINGER), A., i, 654.
 α -Butyric acid, formation of, from glutamic acid (BRASCH and NEUBERG), A., i, 860.
 oxidation of, by hydrogen peroxide (DAKIN), A., i, 74.
 Butyric acid, α -amino-, synthesis of (ZELINSKY and STADNIKOFF), A., i, 607.
 β -amino-, derivatives of (KAY), A., i, 773.
 γ -amino-, derivatives of (GABRIEL and COLMAN), A., i, 274.
 α -amino- γ -hydroxy-, synthesis of, and its dibenzoyl derivative (SØRENSEN and ANDERSEN), A., i, 650.
 α -bromo-, ethyl ester, condensation of, with cyclohexanones (WALLACE, CHURCHILL, and RENTSCHLER), A., i, 404.
 β -hydroxy-, detection and estimation of, in urine (SHAFFER; BLACK), A., ii, 892.
 β - γ -dihydroxy-, lactone of, and its benzoyl derivative (CARRE), A., i, 501.
*iso*Butyric acid, α -amino-, *N*-benzoyl derivative, and its amide and lactimone (MOHR and GEIS), A., i, 339.
 β -amino- α -hydroxy-, ethyl ester, and its hydrochloride and urethane (LES ÉTABLISSEMENTS POULENC FRÈRES & ERNEST FOURNEAU), A., i, 938.

- ⁸⁰Butyric acid, α -bromo-, ethyl ester, condensation with β -cyclohexanone (WALLACH, CHURCHILL, and MALLISON), A., ii, 406.
- butyric acid fermentation. See under Fermentation.
- ⁸⁰Butyric anhydride, α -amino-, nitration and acetylation of (FRANCHIMONT and FRIEDMANN), A., i, 509.
- butyrophenone, γ -amino-, *N*-benzoyl derivative (GABRIEL and COOLMAN), A., i, 275.
- butyrylbutyric acid, ethyl ester, boiling point of (ZELTNER), A., i, 760.
- ⁸⁰Butyryldimethylacetic acid, ethyl ester (ZELTNER), A., i, 760.
- ¹⁴⁸⁰Butyryl-2,6-diphenyl-4-isopropyl- Δ^2 -cyclohexene-1:1-dicarboxylic acid, ethyl ester (DIECKMANN), A., i, 389.
- ⁸⁰Butyryl- α - and β -naphthylhydrazides and the action of calcium oxide on (LIEBER), A., i, 682.
- ¹⁴⁸⁰Butyryl- β -phenylbutyric acid (DIECKMANN and KRON), A., i, 389.
- butyryl-*p*-toluidide, α - and γ -chloro- (WOLFFENSTEIN and ROLLE), A., i, 282.
- butyryltropeine, $\alpha\beta$ -dibromo-, and α -, β -, and γ -chloro-, and their additive salts (WOLFFENSTEIN and ROLLE), A., i, 282.
- Byssus, monoamino-acids of (ARDEH-HALDEN), A., ii, 517.

C.

- Cacao butter, unsaponifiable ingredients of, and their detection in butter (MATTHES and ROHDICH), A., i, 199, 582; (MATTHES and ACKERMANN), A., i, 637.
- Cacao fibre, crude, estimation of (KÖNIG; MATTHES), A., ii, 236.
- Cacodylic acid. See under Arsenic.
- Cadinene, isomerisation phenomena during the preparation of (LEFESCHKIN), A., i, 557.
- dihydrobromide and dihydrochloride, action of bromine and chlorine on (DEUSSEN and LEWINSOHN), A., i, 354.
- Cadmium, electrolytic valve action of (SCHULZE), A., ii, 560.
- Cadmium alloys with aluminium (GWYER), A., ii, 286.
- with calcium (DOŃSKI), A., ii, 279.
- with nickel (Voss), A., ii, 196.
- Cadmium antimonides (KURNAKOFF and KONSTANTINOFF), A., ii, 390.
- chloride, specific gravity of aqueous solutions of (v. BIRON), A., ii, 185.

- Cadmium chloride, alkali double salts of (v. BIRON and APHANASIEFF), A., ii, 249.
- ammonium chromates (GRÖGER), A., ii, 691.
- oxide, velocity of reduction of, by carbon monoxide and the existence of a suboxide (BRISLKE), T., 154.
- potassium calcium sulphate (D'ANS), A., ii, 590.
- Cadmium ion, univalent, existence in aqueous solutions of a (DENHAM), T., 833; P., 76.
- Cæsium rhodium bromide and chloride (GUTHRIE and HÜTTLINGER), A., ii, 200.
- iodate and periodate, specific gravity and solubility of (BARKER), T., 16.
- polyiodides (FOOTE and CHALKER), A., ii, 536.
- nitrate, crystallisation of (JONES), T., 1743; P., 196.
- indium selenate (MATHERS and SCHLUEDERBERG), A., ii, 386.
- dicalcium sulphate (D'ANS), A., ii, 590.
- trithionate and its monohydrate (MACKENZIE and MARSHALL), T., 1736; P., 199.
- Cæsium and rubidium, estimation of (MACKENZIE and MARSHALL), T., 1738; P., 200.
- Caffeine, decomposition of, by extract of ox-liver (KOTAKE), A., ii, 1055.
- physiological action of (SANO), A., ii, 974.
- action of, on frogs (JACOB and GOLOWINSKI), A., ii, 1061.
- compound of, with lithium benzoate (BERGELL), A., i, 1004.
- alkali metaphosphates, preparation of (HOFFMANN LA ROCHE & CIE.), A., i, 825.
- Calcium, chemical properties of (BRUMANN and VAN DER SMISSEN), A., ii, 587.
- spectra of the flame of (HEMSALECH and DE WATTEVILLE), A., ii, 336, 745.
- metallic, action of, on metallic oxides, sulphides, and halogen salts (PERKIN and PRATT), A., ii, 379.
- and magnesium, antagonistic action of (MELTZER and AUER), A., ii, 312, 519.
- action of phosphorus on the circulation of, in normal and rachitic children (FLAMINI), A., ii, 406.
- metabolism of. See under Metabolism.
- function of, in plants (GRAPE and FORTHEIM), A., ii, 884.
- Calcium alloys (DOŃSKI), A., ii, 278.

- Calcium amalgam**, behaviour of, as electrodes in solutions of neutral salts (BYRNE), A., ii, 926.
- Calcium compounds**, colloidal and gelatinous (NEUBERG and REWALD), A., ii, 39.
- with ammonia (KRAUS), A., ii, 486.
- Calcium salts**, importance of, for the growing organism (ARON and SEBASTER), A., ii, 208; (ARON and FRESE), A., ii, 405; (ORGLER), A., ii, 606, 872.
- Calcium boride**, preparation of (STOCK and HOLLE), A., ii, 687.
- carbide**, synthesis of (lecture experiment) (KNECHT), A., ii, 270.
- action of, on some ketones (BODROUX and TABOURY), A., i, 854.
- combination of nitrogen with (POL-LACOT), A., ii, 836.
- carbides**, estimation of phosphorus in (HINRICHSSEN), A., ii, 131.
- carbonate**, polymorphism of (BARLOW and POPE), T., 1528; P. 193.
- solubility of, in aqueous solutions of potassium chloride and potassium sulphate at 25° (CAMERON and ROBINSON), A., ii, 105.
- reaction of, with chlorine water (RICHARDSON), T., 280.
- chemical precipitation of, from sea water (PHILIPPI), A., ii, 302.
- hydrogen carbonate**, preparation and composition of (KEISER and LEAVITT), A., ii, 1036; (KEISER and McMASTER), A., ii, 1037.
- chloride** are spectrum, the red portion of the (MEISENBACH), A., ii, 645.
- decomposition tension of fused (ARNDT and WILLNER), A., ii, 457.
- potassium chromate**, dimorphism of (KAKOWSKY), A., ii, 674.
- fluoride**, band spectrum of (WALTER), A., ii, 336.
- hydride**, action of, on metallic oxides, sulphides, and halogen salts (PERKIN and PRATT), A., ii, 379.
- hypochlorite**, preparation of dry (CHEMISCHE FABRIK GRIESHEIM-ELEKTRON), A., ii, 280.
- hypochlorites**, preparation of (CHEMISCHE FABRIK GRIESHEIM-ELEKTRON), A., ii, 692.
- hydroxide**, action of, on lactose (KILIANI), A., i, 128, 715.
- influence of potassium chloride on the solubility of, and vice versa (KERNOT, D'AGOSTINO, and PELLEGRINO), A., ii, 568.
- hydroxylamite** (EHLER and SCHOTT), A., ii, 1030.
- Calcium nitrate as manure**. See Manurial experiments.
- nitrite**, molecular volumes of (RÄY), P., 240.
- oxide** (*lime*), fused, specific heat of (LATSCHENKO), A., ii, 758.
- crystallisation of, from its nitrate (BRÜGELMANN), A., ii, 842.
- solubility of, in water (MOODY and LEYSON), T., 1767; P., 202.
- reaction of, with sulphur (THATCHER), A., ii, 380.
- action of, in excess on copper sulphate solutions (BELL and TABER), A., ii, 107.
- as manure. See Manurial experiments.
- phosphate**, action of ammonium citrate on (BARILLE), A., ii, 496.
- precipitated, manurial trials with (SÖDERBAUM), A., ii, 423.
- modification of Petermann's method for estimating citrate-soluble phosphoric acid in precipitated (FRIEGERLING and GROMBACH), A., ii, 131.
- phosphates**—the system, $\text{CaO}-\text{P}_2\text{O}_5-\text{H}_2\text{O}$ (BASSETT), A., ii, 675.
- Tricalcium phosphate**, natural factors in the dissolution of, in soil (PEROTTI), A., ii, 527.
- Calcium silicate and manganese silicate**, isomorphism of (GINSBERG), A., ii, 842.
- silicide**, Ca_3Si_2 (HACKSPILL), A., ii, 589.
- preparation of (GOLDSCHMIDT), A., ii, 1037.
- sulphate**, relation of changes of solubility of, and its rate of hydration (ROHLAND), A., ii, 842.
- compound of, with arsenic sulphate (KÜHL), A., ii, 36.
- See also Gypsum.
- sulphates**, neutral triple (D'ANS), A., ii, 690.
- ammonium sulphate**, double. See Ammonium syngenite.
- Dicalcium caesium sulphate** (D'ANS), A., ii, 590.
- Calcium rubidium sulphates** (D'ANS and ZEH), A., ii, 104.
- sulphide**, changes in the colour of, under the influence of light (MOURLO), A., ii, 140.
- Calcium cyanamide**, influence of sterilisation on (KAPPEN), A., ii, 414.
- decomposition of (KAPPEN), A., ii, 414.
- action of sulphuric acid on (JOSA), A., i, 143.
- See also Manurial experiments and Soils.

- iso*-Camphorformolaminecarboxylic acid, *N*-dialkyl derivatives of (TINGLE and WILLIAMS), A., i, 125.
- β -Campholenolactone, synthesis of (BLANC), A., i, 20, 171.
- Campholic acid and *iso*-Campholic acid, direct formation of, from borneol (GUERBERT), A., i, 661.
- Camphor, synthesis of, from nopinone (WALLACH), A., i, 997.
- absorption spectrum of (HARTLEY), T., 961; P., 120.
- and turpentine oil, connexion of cholic acid and cholesterol with (SCHRÖTTER, WEITZENBÖCK, and WITT), A., i, 532; (SCHRÖTTER and WEITZENBÖCK), A., i, 636, 900.
- mercury derivatives (MARSH and STRETHERS), P., 267.
- double salts of, with potassium iodide and mercuric iodide (MARSH and STRETHERS), P., 266.
- physiological action of optical antipodes of, on higher organisms (BRUNI), A., ii, 876.
- separation of, from fenchone (SEMMER), A., i, 37.
- Camphor, α -bromo-, action of amyl nitrite on, in presence of sodium ethoxide (CLARKE, LAPWORTH, and WECHSLER), T., 40.
- imino-, action of formaldehyde on (FORSTER and HOLMES), T., 250; P., 9.
- nitro-, influence of impurities on the mutarotation of (LOWRY and MAGSON), T., 107.
- action of carbonyl chloride in arresting isomeric change in (LOWRY and MAGSON), T., 119.
- isonitroso-, action of diazomethane on the two modifications of (FORSTER and HOLMES), T., 242; P., 8.
- interaction of, with *p*-nitrobenzyl bromide and chloride (FORSTER and HOLMES), T., 248; P., 8.
- N*-ethyl ether of (FORSTER and HOLMES), T., 251; P., 9.
- d*-Camphor, sulphur derivatives of, and their rotatory power (HILDITCH), T., 1619; P., 195.
- Camphoracetal (ARBUSOFF), A., i, 555.
- α -Camphoramides (FREYMON, A., i, 860.
- Camphorecarboxylic acid, kinetics of the elimination of carbon dioxide from (BREDIG and BALCOM), A., ii, 268.
- amine salts, state of, in solution as revealed by the rotatory power (MINGUIN), A., ii, 137.
- Camphor group, synthesis in the (BLANC), A., i, 20, 171.
- d*-Camphoric acid, normal alkyl esters, preparation of (RIEDEL), A., i, 352.
- dl*-Camphoric acid, esters (RIEDEL), A., i, 809.
- Camphoroxalic acid, action of primary and tertiary amines on (TINGLE and WILLIAMS), A., i, 126.
- action of certain secondary amines on (TINGLE and WILLIAMS), A., i, 126.
- Camphorquinone, action of hydrogen peroxide on (FORSTER and HOLMES), T., 252; P., 9.
- Camphor and terpene series, investigations in the (TSCHUGAEFF), A., i, 93.
- Camphylamine benzenesulphonate (v. BRAUN), A., i, 677.
- Camphylpiperidine and its picrate (v. BRAUN), A., i, 677.
- Canal rays. See under Photochemistry.
- Cane sugar. See Sucrose.
- Cacuthe (indiarubber), action of nitrous acid on (GOTTLIEB), A., i, 95.
- action of nitrogen trioxide on (HARRIES), A., i, 39.
- oxydases in (SPENCE), A., ii, 616.
- African, ozonides of (GOTTLIEB), A., i, 436.

- Caoutchouc**, vulcanised, theory of (KABANN), A., i, 838.
See also Rubber.
- Capillarity**, theory of (WHITTAKER), A., ii, 817.
- Capillary investigations**, new (GOPPELS-ROEDER), A., ii, 529.
properties of aqueous solutions of fatty acids (v. SZYSZKOWSKI), A., ii, 1018.
polarimeter tube for small amounts of substances (FISCHER), A., i, 545.
use of liquids, time-law of the, and the relationship of velocity to the chemical constitution (OSTWALD and GOPPELSROEDER), A., ii, 263.
tubes, new method for calibrating (v. SZYSZKOWSKI), A., ii, 827.
- Capparis spinosa**, rutin from (WUNDERLICH), A., i, 559.
- Caprylic acid**. See Octoic acid.
- Carbamie acid**, dithio-. See Dithiocarbamic acid.
- Carbamide** and ammonium cyanate, isomerism of (PATTERSON and MILLAN), T., 1050; P., 135.
condensation of β -diketones with (DE HAAN), A., i, 577.
action of secondary *as*-hydrazines on (MILRATH), A., i, 1014.
action of *as*-phenylbenzylhydrazine on (MILRATH), A., i, 581.
hydrogen peroxide (TANATAR), A., i, 400.
methylol compounds of (EINHORN and HAMBURGER), A., i, 141.
organic salts of (BAUM), A., i, 252.
- Carbamide**, hydroxy- (CONDUCHE), A., i, 12.
isohydroxy-, constitution of, and its condensation with aldehydes (CONDUCHE), A., i, 12, 154.
thio-. See Thiocarbamide.
See also Urea.
- Carbamides**, hydroxy-, and carbamidoximes (CONDUCHE), A., i, 12, 154.
thio-. See Thiocarbamides.
- Carbamidoacetic acid**. See Hydantoic acid.
- Carbamido-acids** and their salts (LIPICH), A., i, 861.
- Carbamidobis-4:5:6-trimethyl-2-pyrimidone** (DE HAAN), A., i, 578.
- Carbamidodiacetonitrile** and its isomeride (v. MEYER and LEHMANN), A., i, 910.
- 4-Carbamido-4:6-dimethyl-2-pyrimidone** (DE HAAN), A., i, 578.
- Carbamidoguanazole** and its hydrobromide (PELLIZZARI and REPETTO), A., i, 65.
- 4-Carbamido-3-hydroxy-4:5-dimethyl-2-methyl-5-methyl-4-methyl-5-ethyl- and -4-phenyl-pyrimidines** (POEL), A., i, 577.
- 1-Carbamido-2-pyridone-5-carboxylic acid**, 3-bromo-, and its methyl ester (BUTLOW and FILCHNER), A., i, 1017.
- Carbamidoximes** and hydroxycarbamides (CONDUCHE), A., i, 12, 154.
molecular refractions of some (CONDUCHE), A., i, 156.
- Carbaminethioglycollarylamides** (FRECHS and WILDT), A., i, 414.
- Carbaminooacetic acid**, dithio-, derivatives of (KÖRNER), A., i, 509.
- 1-Carbamyl-3-ethyl-, -methyl-, and -propyl-pyrazolines** (MAIRE), A., i, 290.
- Carbamylpyrazole** and its dioxime and semicarbazono, and its isomerides (BLAISE and MAIRE), A., i, 391.
- Carbanilide**. See *s*-Diphenylcarbamide.
- Carbazole**, new synthesis of, and the numbering of the positions in (BORSCHKE, WITTE, and BOTHE), A., i, 365.
action of finely divided metals on (PADOA and CHIAVES), A., i, 104.
- Carbazoline**, formation of (CARRASCO), A., i, 913.
- Carbethoxycarbimide** and its reactions (DIELS and JACOBY), A., i, 613.
- Carbethoxydiglycylglycine**, ethyl esters, isomerism of (LEUCHS and LA FORGE), A., i, 723.
- Carbethoxydiglycinimide** (BEROELL and FEIGL), A., i, 140.
- 3-Carbethoxy-1:1-dimethylcyclopentan-2-one-3-acetic acid** (BLANC), A., i, 171.
- Carbethoxyglycyl-N-phenylglycine** (LEUCHS and LA FORGE), A., i, 724.
- Carbethoxyglycyl-N-phenylglycylglycine**, ethyl ester (LEUCHS and LA FORGE), A., i, 724.
- Carbethoxyglycyl-N-phenylglycyl-N-phenylglycine** and its ethyl ester (LEUCHS and LA FORGE), A., i, 724.
- Carbethoxyglycylsarcosine**, ethyl ester (LEUCHS and LA FORGE), A., i, 724.
- α -Carbethoxy-N-phenylglycylglycine** and its esters (LEUCHS and LA FORGE), A., i, 723.
- Carbethoxythiocarbimide** and the action of diphenylamine on (DIXON and TAYLOR), T., 697; P., 74.
- Carbide**, apparatus for the estimation of, in iron and steel (MABS), A., ii, 428.
- Carbides**, formation of some (PRING), T., 2101; P., 240.
See also under the separate Metals.
- Carbimides** (*isocyanates*), new method of forming (ANSCHÜTZ), A., i, 326.

- Carbodiphenylimide**, formation of, from phenylcarbimide (STOLLÉ), A., i, 415.
- Carbohydrates**, colorimetric method of determining the molecular size of (WACKER), A., i, 135.
- behaviour of, towards Fehling's solution and other oxidising agents (NEF), A., i, 5; (KILIANI), A., i, 128.
- of *Coelococcus* and *Phytelephas* (IVANOFF), A., ii, 1064.
- of yeast (MEIGEN and SPRENG), A., ii, 315.
- digestion and absorption of (LONDON and POLOWZOWA), A., ii, 870.
- influence of, on protein metabolism (MARLIN), A., ii, 306.
- parenteral utilisation of (MENDEL), A., ii, 306.
- colour reactions of, based on the formation of furfuraldehyde from them (FLEIG), A., ii, 1077.
- See also Sugars.
- Carbohydrazide**, thio-, preparation and reactions of (STOLLÉ and BOWLES), A., i, 474.
- Carbolic acid**, commercial, and disinfecting powders (BLYTH), A., ii, 328.
- See also Phenol.
- Carbon**, atomic weight of (LEDUC), A., ii, 271.
- the ultimate rays of (DE GRAMONT), A., ii, 645.
- apparatus for experiments at high temperatures and pressures on (THRELFALL), T., 1333; P., 131.
- direct union of, with hydrogen (BONE and COWARD), T., 1975; P., 222.
- reducibility of magnesium oxide by (SLADE), T., 327; P., 29.
- interaction of aluminium powder and (WESTON and ELLIS), A., ii, 849.
- amorphous, bacteria as agents in the oxidation of (POTTER), A., ii, 524.
- vegetable, absorptive power for air of certain varieties of (PIUTTI and MAGLI), A., ii, 585.
- Carbon alloys** with iron (CHABRY), A., ii, 697; (UFTON), A., ii, 1042.
- specific heat of (OBERHOFFER and MEUTHEN), A., ii, 386.
- influence of phosphorus on (WÜST), A., ii, 287.
- with iron and phosphorus (GOERENS and DOBBELSTEIN), A., ii, 1042.
- with iron and silicon (GONTERMANN), A., ii, 851.
- with manganese (STADELER), A., ii, 592.
- Carbon tetrachloride**, successive substitution of the atoms of chlorine in, by aromatic groups (BÖSEKEN), A., i, 189.
- Carbon oxides**, chemical action of radium emanation on (CAMERON and RAMSAY), T., 981; P., 132.
- suboxide (DIELS and LALIN), A., i, 589; (DIELS and BLUMBERG), A., ii, 103.
- constitution of (DIELS and BLUMBERG), A., i, 392.
- refractometric evidence for the constitution of (MICHAEL), A., i, 316.
- monoxide, preparation of (RUPP), A., ii, 943.
- temperature of dissociation of (WOLTERECK), A., ii, 820.
- cuprous compounds of (MANCHOT and FRIEND), A., ii, 375.
- detection of small quantities of, in air (OCIER and KOHN-ARREST), A., ii, 631, 632.
- estimation of, in atmospheric air (MORGAN and McWHORTER), A., ii, 66.
- estimation of, especially in tobacco smoke (MARCELET), A., ii, 533.
- dioxide, pure (BRADLEY and HALE), A., ii, 688.
- causes of the variation of, in air (HENRIET and BONYSSY), A., ii, 578.
- liquid and solid, theoretical determination of the vapour pressure of (FALCK), A., ii, 662.
- decomposition of, by the silent electric discharge (HOLT), P., 271.
- method of assimilation of, under the influence of light (BAUR), A., ii, 790.
- sodium hydrogen carbonate, sodium phosphate, and disodium phosphate, equilibrium between, at body temperature (HENDERSON and BLACK), A., ii, 467.
- influence of colloids on the absorption of, in water (FINDLAY and HARVEY), A., ii, 1024.
- union of, with amphoteric amino-compounds (SIEGFRIED and NEUMANN; SIEGFRIED and LIEBERMANN), A., i, 379.
- action of a mixture of mercury dialkyls and sodium on (SCHORIGIN), A., i, 882.
- liquid, simple arrangement for filling glass tubes with (THIEL), A., ii, 943.
- formation of, in muscle (LATHAM), A., ii, 609.
- tension of, in alveolar air during exercise and chloroform narcosis (COLLINGWOOD and BUSWELL), A., ii, 49.

- Carbon dioxide**, liberation of, by dead parts of plants (NABOKICH), A., ii, 616.
 photosynthesis of, by chlorophyll (EWART), A., ii, 217; (MAKELI and POLLACCI), A., ii, 881.
 estimation of (JANNASCH), A., ii, 430.
 apparatus for the estimation of (POZZI-ESCOT), A., ii, 1071.
 soda-lime apparatus for the estimation of (DENNSTEDT), A., ii, 225.
 the autolysator for the automatic estimation of (KEANE and BURROWS), A., ii, 735.
 and other acids, volumetric estimation of, in air (HENRIET and BONYSSY), A., ii, 734.
 estimation of, in electrolytic chlorine (PHILOSOPHOFF), A., ii, 132.
 and oxygen, estimation of small quantities of, in small volumes of saline solutions (BRODIE and CULLIS), A., ii, 319.
 rapid estimation of, in mineral waters (STRÁNSKY), A., ii, 225.
 disulphide, low ignition temperature of (SCRIBA), A., ii, 376.
 synthesis of a polymeride of (LOSANITSCH), A., ii, 32.
 effect of, on plants and soils (EGOROV), A., ii, 421.
 estimation of, in benzene (BAY), A., ii, 226.
- Carbon**, estimation of (POUGET and CHOUGHAK), A., ii, 225.
 estimation of, in carborundum (PARR), A., ii, 628.
 estimation of, in ferro-alloys, steel, and plumbago by means of an electric furnace (JOHNSON), A., ii, 630.
 estimation of, in iron (DE KONINCK and v. WINIWARDER), A., ii, 320.
 apparatus for the estimation of, in iron (WIDERMANN), A., ii, 984; (GRZESCHIK), A., ii, 1071.
 estimation of, in pig-iron and steel (ORTHEY), A., ii, 131.
 estimation of, in steel (ISHAM and AUMER), A., ii, 898.
 and hydrogen, the Carrasco-Plancher method of estimating, in organic substances (LENZ), A., ii, 65.
 estimation of organic, in waters (POPOWSKY), A., ii, 435.
 See also Charcoal, Diamond, and Graphite.
- Carbon acids**, fate of, in the dog (FRIEDMAN), A., ii, 205.
- Carbon molecule**, constitution of the (THOMLINSON), A., ii, 763.
- Carbon molecule**, constitution of the, from the standpoint of thermochemistry (KROGOVY), A., ii, 177.
- Carbonates**, action of, on tetrathionates (GUTMANN), A., ii, 173.
 See also Percarbonates.
- Carbonyl chloride**, dissociation of (BODENSTEIN and DUNANT), A., ii, 178.
 action of, as an agent for arresting isomeric change (LOWRY and MACSON), T., 119.
- Carbonyl compounds**, reaction of, with hydroxylamine and its hydrochloride (ACREE), A., ii, 169.
- Carbonyl-2-aminophenol-4-sulphonic acid**, 5-nitro- (FARBWERKE vorm. MEISTER, LUCIUS, & BRÜNING), A., i, 157.
- Carbonylcyanochrysoidine**. See Keto-2-phenylbenzotriazine, *m*-cyanamino-
 imino-. See 2-Phenylbenzotriazine, imino-*m*-cyanamino-.
- Carbonyldi-iminodiacetic acid**, methyl ester, amide and nitrile of (JONGKES), A., i, 960.
- Carbonyldioxybenzene**, formation of (BARGER), T., 566.
- 3:4-Carbonyldioxybenzoic acid** and its methyl, phenyl, and methoxyphenyl esters, chloride, and anilide (BARGER), T., 568.
- Carbonyldioxyethylthionaphthen**, dichloro- (BARGER and EWINS), T., 2090.
- α -3:4-Carbonyldioxyphenylethane**, α -dichloro- (BARGER), T., 2084; P., 237.
- α -3:4-Carbonyldioxyphenylpropane**, α -dichloro- (BARGER), T., 2085; P., 237.
- Carbonyldioxythionaphthen**, 4:5 (or 5:6)-, 1:2-dichloro- (BARGER and EWINS), T., 2087.
- Carborundum**, technical assay of amorphous (CHESNEAT), A., ii, 323.
 estimation of carbon in (PARR), A., ii, 628.
 See also Silicon carbide.
- isocarboxystyryl-4-carboxylic acid** and its ethyl ester (DIECKMANN and MEIER), A., i, 895.
- Carboxonium dyes** (KEHRMANN and DENGLE), A., i, 1002.
- Carboxy- α -acetylglutaric acid**, ethyl ester, synthesis and hydrolysis of (SIMONSEN), T., 1786.
- β -Carboxy- δ -acetylvaleric acid** and its oxime and semicarbazone (MELDRUM and PERKIN), T., 1427.
- α - γ -3-Carboxyamino-4-piperidylacetic acid** and its hydrochloride (WOHL and LOSANITSCH), A., i, 48.

- p*-2-Carboxyanilinoethyl ethyl ketone** (BLAISE and MAIRE), A., i, 588.
- 4-Carboxybenzenesulfo-3-methyl-5-pyrazolone** (BÜLOW and SCHAUB), A., i, 706.
- Carboxybenzenesulfoacetic acids, o- and m-** (GRANDMOUGIN and GUISAN), A., i, 927.
- Carboxybenzoyl-o-benzoic acid, o- and p-chloro-** (HÄLLER and SCHÜLKE), A., i, 395.
- o*-Carboxy- β -benzoylpropionic acid** (BOUGAULT), A., i, 422.
- 2-Carboxy-4,5-dimethoxyphenylacetic acid, preparation of** (PERKIN and ROBINSON), T., 516.
- Carboxyethyl-**. See Carboethoxy.
- Carboxyhemoglobin, sensitive reaction for** (DE DOMINICIS), A., ii, 648.
- o*-Carboxy- γ -hydroxy- γ -phenylbutyric acid, lactone of** (BOUGAULT), A., i, 422.
- Carboxyl group, a case of the inhibiting action of the** (NIEBERSTEIN and WEBSTER), A., i, 89.
- replacement of the sulphonic group by the, in azo-compounds (LANGE), A., i, 300.
- Carboxylic acids, conversion of, into their aldehydes** (MERLING), A., i, 653; (STAUDINGER), A., i, 654.
- degradation of, in the animal body (FRIEDMANN), A., i, 421; ii, 719; (DAKIN), A., ii, 719; (KNOOP), A., ii, 720.
- aromatic, new synthesis of, from the hydrocarbons (SCHORIGIN), A., i, 886.
- primary and secondary, liberation of carbon monoxide from (BISTRZYCKI and v. SIEMIRADZKI), A., i, 535.
- p*-Carboxylic acids, stability of** (LEUCHS and LA FORGE), A., i, 723.
- Carboxymethemoglobin, influence of light on the formation of** (GROBER), A., i, 486.
- Carboxy-5-methoxyphenoxyacetic acid** (ENGELS, PERKIN, and ROBINSON), T., 1146.
- synthesis of (PERKIN and ROBINSON), T., 504.
- Carboxymethyl-*ab*-diphenylthiocarbamide, preparation of** (DIXON and TAYLOR), T., 697; P., 74.
- Carboxymethyliminodiacetic acid and its derivatives** (JONCKEES), A., i, 960.
- p*-Carboxymethyl-leucine, -phenylalanine, and -*C*-phenylglycine and their anhydrides** (LEUCHS and GEIGER), A., i, 541.
- Carboxymethylrhedanic acid. See Rhodaminacetic acid.**

Chromammonium compounds. See under Chromium.

Chromate solutions, optical investigation of the condition of (HANTZSCH and CLARK), A., ii, 646.

Chromic acid and Chromates. See under Chromium.

Chromites in meteorites (TASSIN), A., ii, 956.

Chromium, stereochemistry of (PFEIFFER), A., i, 79; (PFEIFFER, PRADE, and STERN), A., i, 506; (PFEIFFER, VORSTER, and STERN), A., i, 507; (PFEIFFER, GASSMANN, and PIETSCHE), A., i, 508.

passivity of (FREDENHAGEN), A., ii, 679.

higher oxidation products of (RIESENFELD and WESCH), A., i, 963.

Chromium alloys with cobalt (LEW-KONIA), A., ii, 853.

with manganese (HINDRICH), A., ii, 856.

with nickel (VOSS), A., ii, 195.

Chromium salts, isomerism of (PFEIFFER), A., ii, 594.

compounds of, with ethylenediamine (PFEIFFER), A., i, 79; (PFEIFFER, PRADE, and STERN), A., i, 506; (PFEIFFER, VORSTER, and STERN), A., i, 507.

compounds of, with ethylenediamine and propylenediamine (PFEIFFER, GASSMANN, and PIETSCHE), A., i, 508.

Chromium chlorosulphate (WEINLAND and SCHUMANN), A., ii, 595.

nitride, Cr_3N_2 (HENDERSON and GALLETT), A., ii, 485.

oxides, magnetic (SHUKOFF), A., ii, 699.

heat of formation of (MIXTER), A., ii, 929.

dissociation of, and of the double oxides of chromium and copper (L. and P. WÖHLER), A., ii, 387.

tetroxide compounds (RIESENFELD and WESCH), A., i, 963.

sesquioxide, reduction of, by carbon (GREENWOOD), T., 1488; P., 188.

Chromic acid, decomposition of, by hydrogen peroxide (RIESENFELD and WESCH), A., ii, 951.

reduction of, by oxalic acid (JABECZYŃSKI), A., ii, 935.

as an oxidising agent (SEUBERT and CARSTENS), A., ii, 196.

compounds of, with acetic acid (WEINLAND), A., i, 847.

and vanadic acid, iodometric estimation of, in presence of each other (EDGAR), A., ii, 989.

Chromium:—

Chromates (BRIGGS), A., ii, 113.

equilibrium relations of, in solution (SHERRILL, EATON, MERRILL, and RUSS), A., ii, 92.

compounds of, with pyridine (BRIGGS), A., ii, 113; (PARRA-VANO and PASTA), A., ii, 294.

Chromium sulphate, new (NICOLARBOT), A., ii, 112.

sulphates, blue and green, electrometric determination of the hydrolysis of (DENHAM), A., ii, 389.

green (COLSON), A., ii, 45; (WYROUBOFF), A., ii, 369.

Dihydroxotetra-aquochromium sulphate (WERNER, JOVANOVIĆ, ASCHKINASY, and POSSELT), A., i, 936.

Chromic chloride, molecular weight of the greyish-blue hydrate of, and neutralisation of, by sodium hydroxide, and hydrolysis of, by potassium iodide and iodate (SAND and GRAMMING), A., ii, 293, 294.

Chromous chloride, preparation of pure, and its hydrates (RICH), P., 215.

decomposition of, by means of platinum (JABECZYŃSKI), A., ii, 680.

Chromium organic compounds (WERNER, JOVANOVIĆ, ASCHKINASY, and POSSELT), A., i, 935; (RIESENFELD and WESCH), A., i, 964.

Chromammonium thiocyanate, ammonium iodide of, $\text{C}_6\text{H}_{10}\text{N}_4\text{S}_4\text{ICr}$, constitution of (PFEIFFER and TILGNER), A., i, 614.

Chromihexathiocyanatoammonium acetate (MAAS and SAND), A., i, 961.

Chromium, detection of (POZZI-ESCOT), A., ii, 900.

and manganese, detection of, in presence of each other (KARSLAKE), A., ii, 635.

estimation of, as silver chromate (GOOCH and WEED), A., ii, 737.

and iron, volumetric estimation of, by means of titanous chloride (JATAR), A., ii, 778.

estimation of, in steel (BLAIR), A., ii, 900.

and nickel, estimation of, in steel (CAMPBELL and ARTHUR), A., ii, 779.

and tungsten, estimation of, in steel (HINRICHSSEN and WOLTER), A., ii, 900.

separation of tungsten from (v. KNORRE), A., ii, 779.

- Chromophore**, $OO \cdot C : C$, function of the double (ZWAYER, v. KOSTANECKI, and SZWEKOWSKA), A., i, 443.
- Chromotropic acid** (1:8-dihydroxynaphthalene-3:6-disulphonic acid), cerium salt (BERDMANN and NIESZYTKA), A., i, 622.
- Chrysalidene oil**, two paraffin hydrocarbons in the unsaponifiable portion of (MENOZZI and MORESCI), A., i, 241.
- Chrysalis oil** from silk-worms, composition of (TSUJIMOTO), A., ii, 517.
- Chrysaron** and its triacetyl derivative and **Chrysaranthanol** (HESSE), A., ii, 419.
- Chrysazin**, hydroxy-, and its triacetyl derivative, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 807.
- p*-nitro-, and its dimethyl ether (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 428.
- Chryszindisulphonic acid**, dibromo-, preparation of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 308.
- Chrysoidine**, cyano-, and its acetyl and benzoyl derivatives (PIERON), A., i, 926.
- Chrysophananthanol** (HESSE), A., *i, 438.
- Chrysophanic acid**, constitution of (HESSE), A., i, 438.

- sulphate, acid persulphate, and picrate (WOLFFENSTEIN and WOLFF), A., i, 283.
- Cinchoninones** and its methiodide, sodium salts of (RABE and SCHNEIDER), A., i, 361.
- and its oxime and their derivatives (RABE and BUCHHOLZ), A., i, 100.
- Cinemic acid**, preparation of, and condensations with (RUPP and LICHTENHAN), A., i, 390.
- Cineol**, estimation of, in eucalyptus oil (WEBER and LEHMANN), A., i, 233.
- Cinnamaldehyde hydrogen persulphid** (BRUNNER and VUILLEUMIER), A., i, 900.
- Cinnamenylacrylic acid**. See Cinnamylidenacetic acid.
- γ*-Cinnamenylserotonic acid and a hydroxy- (BOUGAULT), A., i, 538.
- Cinnamic acid** and its derivatives, addition of halogens to (MICHAEL and SMITH), A., i, 168.
- velocity of esterification of, by means of alcoholic hydrogen chloride (KAILAN), A., ii, 27.
- conversion of, into styrene by means of moulds (HERZOG and RIFE), A., ii, 1064.
- and benzoic acid, separation of (DE JONG), A., ii, 993.
- Cinnamic acid**, alkaloidal salts, and their optical activity (HILDITCH), T., 709; P., 61.
- Cinnamic acid**, bornyl and menthyl esters, optical properties of (HILDITCH), T., 1.
- ethyl ester, action of sodium benzyl cyanide on (AVERY and McDOLZ), A., i, 343.
- menthyl ester, optical rotatory power of (HILDITCH), P., 286.
- Cinnamic acid**, amino-derivatives and *p*-nitro-, alkylaminosalkyl esters of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 169.
- o*-, *m*-, and *p*-nitro-, velocity of esterification of, by means of alcoholic hydrogen chloride (KAILAN), A., ii, 27.
- allo*Cinnamic acid, oxidation of (RIEDER), A., i, 639.
- Cinnamide** and *o*-nitro-, action of potassium hypochlorite on (WEERMAN), A., i, 22.
- Cinnamoylsalicylic anhydride** (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 984.
- Cinnamoyltriphenylmethane**, isomeric (SCHMIDLIN and HODGSON), A., i, 240.
- Cinnamylidenacetic acid** (cinnamenylacrylic acid) and its methyl ester, action of ammonia and amines on (RIEDEL), A., i, 536.
- Cinnamylidenacetophenone**, action of hydroxylamine on (CIUSA and TERZI), A., i, 763.
- Cinnamylidenacetophenone-hydroxylamines** and -oximes and their benzoyl derivatives, α - and β - (CIUSA and TERZI), A., i, 763.

- Cinnamylideneaminodimethylaniline** and its hydrochlorides (MOORE and GALE), A., i, 369.
- Cinnamylidene carbamidoxime** (CONDUCHÉ), A., i, 154.
- Cinnamylidene esters**, reactions of, with organic magnesium compounds (REIMER and REYNOLDS), A., i, 988.
- Circulation and respiration**, effects of excess of carbon dioxide and want of oxygen on (HILL and FLACK), A., ii, 706.
- See also Heart.
- Citral**, estimation of, in essence of lemon (BRUYLANTS), A., ii, 330.
- estimation of, in lemon grass oil (BLOCH), A., ii, 782.
- Citral hydrate**, preparation of (COULIN), A., i, 999.
- condensation of, with ketones (COULIN), A., i, 1000.
- isomeride of (COULIN), A., i, 1000.
- Citrals**, formation of, from their corresponding acids (MERLING), A., i, 653.
- Citralidnemalonic acid**, methyl ester (MEERWEIN), A., i, 90.
- Citric acid** in wine (HUBERT), A., ii, 544.
- the natural, of wine (DUPONT), A., ii, 904.
- new synthesis of (FERRARIO), A., i, 758.
- detection of, in wine, &c. (FAVREL; ASTRUC; DENIGES), A., ii, 640.
- Citric acid**, ammonium salt, action of, on calcium phosphate (BARILLÉ), A., ii, 496.
- bismuth salt (TELLE), A., i, 852.
- calcium salt, hydrates of (VAN ITALLIE), A., i, 854.
- glycinum salt (TANATAR and KUROVSKI), A., i, 758.
- basic ferric salt (ROSENTHALER and SIEBECK), A., i, 246.
- Citronella series**, compounds of the (HARRIES and HIMMELMANN), A., i, 662.
- Citronellaldehyde**, ozonides of (HARRIES and HIMMELMANN), A., i, 662.
- Citronellie acid**, ozonides of (HARRIES and HIMMELMANN), A., i, 663.
- Citronellol ozonide** (HARRIES and HIMMELMANN), A., i, 663.
- Cladoniaceæ**, chemical monograph of the (ZOFF), A., ii, 526.
- Claissen reaction**, mechanism of the (TINGLE and GOSLINE), A., i, 732.
- Clay**, separation of, in the estimation of humus (MOORE and HAMPTON), A., ii, 744.
- Clay analysis** (BLOOR), A., ii, 71.
- Coagulation and agglutination** (AREHNUS), A., ii, 822.
- process of, from colloidal solutions (WOUDSTRA), A., ii, 160; (LOTTER-MOSER), A., ii, 365.
- Coagulometer**, Buckmaster's, modification of (GOLLA), A., ii, 766.
- Coaguloses** (LAWROFF), A., i, 844.
- Coal**, proximate constituents of (BEDSON), A., ii, 302.
- relation between the composition of, and the amounts of carbon monoxide and dioxide contained in gas distilled from it (VIGNON), A., ii, 177.
- Parr's method of estimating the heat of combustion of (PARR), A., ii, 533; (CONSTAM), A., ii, 734.
- rapid estimation of sulphur in (KOMAROWSKY), A., ii, 892.
- Coal gas**, estimation of naphthalene in (GAIR), A., ii, 135.
- See also Gas, illuminating.
- Coal tar**, occurrence of nononaphthene in (AHRENS and v. MOZDZEŃSKI), A., i, 618.
- Cobalt**, iron, and nickel, experiments on the passivity of (BYERS), A., ii, 1026.
- Cobaltamine salts** (WERNER), A., ii, 42; (WERNER, BINDSCHEDLER, and GRÜN), A., ii, 43; (SAND and BÖKMAN), A., ii, 44.
- iodo- (WERNER), A., ii, 950.
- Cobalt alloys** with aluminium (GWYER), A., ii, 236.
- with antimony, bismuth, chromium, lead, tin, thallium, silicon, and zinc (LEWKONJA), A., ii, 853.
- with arsenic, freezing point curve of (FRIEDRICH), A., ii, 387.
- with copper (SAHMEN), A., ii, 136.
- with lead (DUCELLIEZ), A., ii, 594.
- with tin (LEWKONJA), A., ii, 853; (SCHREMTSCHUSCHNY and BELYNSKY), A., ii, 855.
- Cobalt salts**, abnormal behaviour of, on hydrolysis (DENHAM), A., ii, 380.
- compounds of, with ethylenediamine and propylenediamine (PFEIFFER, GASSMANN, and PIETSCH), A., i, 508.
- Cobalt arsenides** (DUCELLIEZ), A., ii, 853.
- ammonium chromates (GRÖGER), A., ii, 691.
- molybdate and nickel molybdate (Pozzi-Escort), A., ii, 1042.
- oxides, dissociation pressures of (FOOTE and SMITH), A., ii, 847.
- sulphides (I. and L. BELLUCCI), A., ii, 196.

- Cobalt sulphides**, freezing point diagram of (FRIEDRICH), A., ii, 500.
- Cobaltinitrites**, studies on the (CUNNINGHAM and PERKIN), P., 212.
- compounds of with *p*-toluidine, diazoaminotoluene, hydrazine, and nitrosohydrazine (HOFMANN and BUCHNER), A., i, 875.
- Cobalt ethylenediamine and pyridine thiocyanates**, action of iodine on (FIEFFER and TILGNER), A., i, 614.
- Cobalt dioximes** (TSCHUGAEFF), A., i, 615.
- Cobaltinitritoquodimethylglyoximine** (TSCHUGAEFF), A., i, 616.
- Cobaltidinitritodimethylglyoximinic acid and its salts** (TSCHUGAEFF), A., i, 616.
- Cobalt**, detection of, in presence of large quantities of nickel (POZZI-ESCOT), A., ii, 988.
- and nickel, simultaneous qualitative test for (GROSSMANN and HEILBORN), A., ii, 635.
- detection and estimation of (POZZI-ESCOT), A., ii, 899.
- colorimetric estimation of, in presence of each other (CHALLINOR), A., ii, 938.
- estimation and separation of (POZZI-ESCOT), A., ii, 229, 539, 540.
- separation of iron from (LABY), A., ii, 988.
- Cobaltamine salts and Cobaltinitrites**. See under Cobalt.
- Cobra poison**. See Poison.
- Coca**, assay of (GRESHOFF), A., ii, 441, 997; (DE JONG), A., ii, 997.
- Java, estimation of ecgonine in (DE JONG), A., ii, 239.
- Coca leaves**, estimation of total alkaloids in (DE JONG), A., ii, 440; (GRESHOFF), A., ii, 441.
- Cocaine in Java coca** (DE JONG), A., i, 825.
- Cockchafer**, natural melanin of the (ISHIZAKA), A., i, 280.
- Cocos**, estimation of fat in (KREUTZ), A., ii, 641.
- Cocconut**. See *Cocos nucifera*.
- Cocconut oil**, new constant for the detection of (HANTS and STEKL), A., ii, 641.
- Cocos nucifera*, composition of the milk and ferments of the fruit of (DE KRUYFF), A., ii, 526.
- ψ -apocodeine and apomorphine**, relation between (KNORR and RAABE), A., i, 908.
- isocodeine**, relationship of, to codeine (KNORR and HÖRLEIN), A., i, 42.
- Codeines**, four isomeric, relationship of, to the morphine (KNORR and HÖRLEIN), A., i, 42.
- Codide**, α - and β -chloro-, hydrolytic products of (KNORR and HÖRLEIN), A., i, 361.
- β -chloro- (KNORR and HÖRLEIN), A., i, 42.
- Cod liver oil**, leucomaines of (HAWK), A., ii, 308.
- Celenterata**, cholesterol in (DORÉ), A., ii, 769.
- Celestin-blue B** (*correin RR*), compounds of, with amino-compounds, and its picrate (GRANDMOUGIN and BODMER), A., i, 290, 572.
- compound of, with aniline (GRANDMOUGIN and BODMER), A., i, 290.
- Coelococcus**, carbohydrates of (IVANOFF), A., ii, 1064.
- Co-enzyme** of expressed yeast in juice (BUCHNER and KLATTE), A., i, 380.
- Coffalic acid** (GORTER), A., i, 346.
- Coffee** (GORTER), A., i, 186, 345.
- Coffee extract**, Liberian (GORTER), A., i, 186.
- Coke**, conversion of diamond into, in high vacuum by cathode rays (PARSONS and SWINTON), A., ii, 275.
- Colchicine**, physiological effects of (DIXON and MALDEN), A., ii, 520.
- Collidine and its hydrochloride**, absorption spectra of (PURVIS), A., ii, 745.
- and its *nonachloro*-, absorption spectra of (PURVIS and FOSTER), A., ii, 244.
- Colloid producer**, gelatose as (LIESEGANG), A., ii, 476.
- Colloidal granules**, influence of the reaction of the medium on the size of (MAYER, SCHLEFFER, and TERROINE), A., ii, 24.
- liquids, influence of electrolytes on the viscosity of (ALBANESE), A., ii, 1018.
- metallic solutions, examination of, by the ultra-microscope (REISSIG), A., ii, 933.
- Colloidal solutions** (SVEDBERG), A., ii, 23.
- does Beer's law hold for? (SCARPA), A., ii, 244.
- electrical nature of (DUCLAUX), A., ii, 760; (PAPPADÀ), A., ii, 1024.
- influence of radium on the electrolytic conductivity of (ZABOICKI), A., ii, 451.
- viscosity of (FAWSITT), T., 1004; P., 121; (WOUDSTRA), A., ii, 464.
- stability of (SVEDBERG), A., ii, 364.

- Colloidal solutions in galvanic cells, coagulation of (BILTZ), A., ii, 822.
 See also Hydrogels and Hydrosols.

- dihydroxy-, and its diacetate (GATTERMANN), A., i, 31.
- Coumarins and thio-**, residual affinity of, as shown by their additive compounds (CLAYTON), T., 524; P., 26.
- formation of (CLAYTON), T., 2016; P., 229.
- conversion of, into coumarinic acids and o-coumaric acids (FRIES and KLOSTERMANN), A., i, 820.
- reduction of, with zinc dust in alkaline solution (FRIES and FICKEWIRTH), A., i, 822.
- Coumarin-3-carboxylic acid**, preparation of (HAARMANN & REIMER), A., i, 345.
- iso-Coumarin-4-carboxylic acid** and its esters (DIECKMANN and MEISER), A., i, 894.
- Coumarinic acids**, formation of, from coumarins (FRIES and KLOSTERMANN), A., i, 820.
- Coumarone and hydrocoumarone derivatives** from 4:7-dimethylcoumarin (FRIES and FICKEWIRTH), A., i, 824.
- chlorohydrin and glycol** (BOES), A., i, 444.
- Covellite** from Servia (STEVANOVIĆ), A., ii, 396.
- synthesis of (CORNU), A., ii, 396.
- Cows**, protein minimum in the food of, A., ii, 607.
- Crab extract** (ACKERMANN and KUTSCHER), A., ii, 53.
- Crangitine** and its hydrochloride and aurichloride from crab extract (ACKERMANN and KUTSCHER), A., ii, 53.
- Crangonine** and its aurichloride from crab extract (ACKERMANN and KUTSCHER), A., ii, 53.
- Crawfish**, digestive gland of the (BRADLEY), A., ii, 405.
- Creatine and creatinine** (MELLANBY), A., ii, 308.
- formation and destruction of, in perfused organs (GÜTTLICH and STANGASSINGER), A., ii, 515.
- behaviour of, in autolysis (STANGASSINGER; GÜTTLICH and STANGASSINGER), A., ii, 515; (ROTHMANS), A., ii, 967.
- in frog's muscle (BROWN and CARTER), A., ii, 516.
- in meat and meat extracts (EMMETT and GRINDLEY), A., ii, 53.
- excretion of (VAN HOOGENHUYZE and VERPLOEGH; SHAFFER), A., ii, 971.
- excretion of, in hepatic disease (MELLANBY), A., ii, 54.
- Creatinine** and creatine (MELLANBY), A., ii, 308.
- distillation of (ENGELAND), A., i, 958.
- in frog's muscle (BROWN and CARTER), A., ii, 516.
- of infants' urine (FUNARO), A., ii, 718.
- in meat and meat extracts (EMMETT and GRINDLEY), A., ii, 53.
- excretion of (VAN HOOGENHUYZE and VERPLOEGH; SHAFFER), A., ii, 971.
- excretion of, in hepatic disease (MELLANBY), A., ii, 54.
- Creatinine metabolism**. See Metabolism.
- Cresol**, poisoning by (BLUMENTHAL and JACOBY), A., ii, 55.
- o-Cresol**, synthesis of pulenonederivatives from (AUWERS and HESSENLAND), A., i, 550.

- Cresol, 3-bromo-, 3-bromo-5-nitro-, and its potassium salts, and 5-bromo-3-nitro-, potassium salts of (ROBERTSON), T., 789; P., 73.
- Cresol, estimation of, in cresol mixtures (RASCHIG & HEEZOG), A., ii, 233.
- Cresol, condensation of, with epichlorohydrin (BOYD and MARLE), T., 839; P., 92.
- action of potassium persulphate on (KUMAGAI and WOLFFENSTEIN), A., i, 159.
- Cresol, 2-amino-, bisazo-derivatives, preparation of (ANILINFARBEN- & EXTRAKT-FABRIKEN VORM. J. R. GEIGY), A., i, 1022.
- and *p*-Cresol methyl ethers, sulphination of (SMILES and LE ROSSIGNOL), T., 756.
- resols, *o*-, *m*-, and *p*-, bisazo-dyes from (SCHULTZ and ICHENHAEUSER), A., i, 229.
- Cresol-5-arsinic acid (BENDA and KAHN), A., i, 592.
- Cresol-3-sulphonic acid, 2-nitro-5-amino- and *o*-Cresol-5-sulphonic acid, 6-nitro-3-amino-, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 785.
- Cresolsulphonic acids, copper salts, and the action of ammonia and pyridine on (LEY and ERLER), A., i, 177.
- resorcinol (2,4-dihydroxytoluene) dimethyl ether, aldehyde from, and its oxime, synthesis of (GATTERMANN), A., i, 34.
- resorcyraldehyde and its azine, synthesis of (GATTERMANN), A., i, 30.
- critical opalescence. See Opalescence.
- temperatures and molecular weights of liquids, determination of, by the aid of drop weights (MORGAN and STEVENSON), A., ii, 356; (MORGAN and HIGGINS), A., ii, 668.
- of solutions (CENTNERSZWER), A., ii, 13.
- rops, influence of stimulating compounds on, under different conditions (UCHIYAMA), A., ii, 126.
- farm, pot experiments to determine the limits of endurance of, for certain injurious substances (GUTHRIE and HELMS), A., ii, 890.
- rotonaldehyde, condensation of, with malonic acid (RIEDEL), A., i, 501.
- action of organo-magnesium compounds on, and the optical behaviour of the products (REIF), A., i, 847.
- XCIV. ii.
- Crotonic acid, stereochemical nature of the addition of chlorine to (MICHAEL and BUNGER), A., i, 848.
- Crotonic acid, ethyl ester, action of semicarbazide on (RUPE and HINTERLACH), A., i, 13.
- Crotonic acid, γ -chloro- β -amino- α -cyano-, ethyl ester (BENARY), A., i, 600.
- Crotonylidenacetone and its bromo-compound, oxime, phenylhydrazones, and semicarbazone (MEERWEIN), A., i, 90.
- Crotonylidenemalonic acid (RIEDEL), A., i, 501.
- methyl ester (MEERWEIN), A., i, 90.
- Crotonyltropine and its picrate (WOLFFENSTEIN and ROLLE), A., i, 282.
- Crucibles of iridium and rhodium, use of, in chemical operations (CROOKES), A., ii, 702.
- Cryolite, reversible alteration of (CORNU), A., ii, 955.
- Cryometric measurements, practice of (PODA), A., ii, 564.
- Cryoscope, a (DEKHUYZEN), A., ii, 661.
- Cryoscopic investigations of solutions of gases in liquids (FALCICOLA), A., ii, 1015.
- measurements, stand for apparatus for (LESPIEAU), A., ii, 564.
- method, modification of the, for investigating small quantities of (KINOSHITA), A., ii, 810.
- Crystalline form, chemical composition, hardness, and density, relation between (PÖSCHL), A., ii, 673.
- and chemical constitution of picryl derivatives, relation between (JERUSALEM and POPE), A., ii, 674.
- of halogen derivatives of open-chain hydrocarbons with reference to the Barlow-Pope theory of structure (JAEGER), T., 517; P., 29.
- Crystalline liquids, anomalous viscosity at the clearing point of so-called (BOSE and CONRAT), A., ii, 258; (BOSE), A., ii, 1017.
- amorphous, and colloidal states (v. WEIMARN), A., ii, 90.
- liquid state as a general property of matter (v. WEIMARN), A., ii, 90, 263, 1023.
- state as a general property of matter (v. WEIMARN), A., ii, 263.
- Crystallisation from aqueous solutions (MARCO), A., ii, 160.
- velocity of, of isomorphous mixtures (PADOA), A., ii, 89.
- explosive (WESTON), A., ii, 759.

- Crystallisation**, spontaneous, the temperatures of, of mixed solutions and their determination by means of the index of refraction (ISAAC), T., 384; P., 30.
- of solutions of some alkali nitrates (JONES), T., 1789; P., 196.
- of substances which form a continuous series of mixed crystals (MIERS and ISAAC), T., 927; P., 125.
- Crystallography** of the monoxides and monosulphides of the elements of the second group (BECKENKAMP), A., ii, 280.
- of some cyclic organic compounds (JAEGER), A., i, 413.
- See also Isomorphism and Polymorphism.
- Crystal-systems** and the optical interference-figures of liquid crystals (VORLÄNDER), A., ii, 88.
- Crystals**, orientation of, by the magnetic field; importance of optical properties of mixed liquids from the point of view of crystalline symmetry (CORTON and MOUTON), A., ii, 757.
- natural and magnetic rotation of the plane of polarisation in (VOIGT and HONDA), A., ii, 912.
- rate of growth and solution of (ANDRÉEFF), A., ii, 475.
- causes modifying the dominant faces of (GAUBERT), A., ii, 933.
- parallel growths of, and isomorphous miscibility (BARKER), A., ii, 866.
- apparatus for the centrifugal draining of small quantities of (BAXTER), A., ii, 369.
- helical structures (GAUBERT), A., ii, 475.
- influence of temperature changes on the absorption in (BEQUEREL), A., ii, 78.
- which are not enantiomorphous, rotatory polarisation in (SOMMERFELDT), A., ii, 339.
- liquid, clear and transparent (VORLÄNDER and KASTEN), A., i, 641; (VORLÄNDER), A., ii, 675.
- liquid (ROTARSKI), A., i, 640; ii, 675; (LEHMANN), A., ii, 1023.
- formation of (VORLÄNDER), A., ii, 22.
- relation between constitution and capacity for forming (VORLÄNDER and KASTEN), A., i, 641; (BOSE), A., ii, 1017.
- optical interference-figures of (VORLÄNDER), A., ii, 89.
- examination of, in convergent polarised light (SOMMERFELDT), A., ii, 338.
- Crystals**, liquid, and their mixture, character of melting point and clearing point curves for (BOGOWALENSKY and WINOGRADOFF), A., ii, 899.
- mixed, hardness of (KURNAKOFF and SCHEMTSCHUSCHNY), A., ii, 932.
- mixed saturated, influence of the rate of cooling on the composition of (v. LEFKOWSKI), A., ii, 810.
- Ctenophore swimming-plate**, rôle of calcium salts in the mechanical inhibition of (LILLIE), A., ii, 310.
- Cubebin** (MAMELI), A., i, 20.
- Cubebs**, oil of (HAENSEL), A., i, 565.
- Cultivation experiments**, comparative investigation of the results of chemical soil analyses and of (OPITZ), A., ii, 421.
- ψ-Cumeneazo-oreinol, 6-bromo- (ORTON and EVERATT), T., 1020.
- ψ-Cumene-4-azoresorcinol, 6-bromo- (ORTON and EVERATT), T., 1019.
- p-Cumenesulphinic acid, preparation of (KNOEVENAGEL and KENNER), A., i, 971.
- ψ-Cumenesulphinic acid preparation of (KNOEVENAGEL and KENNER), A., i, 971.
- p-Cumenesulphinic anhydride, preparation of (KNOEVENAGEL and POLACK), A., i, 971.
- ψ-Cumenesulphinic anhydride, preparation of (KNOEVENAGEL and POLACK), A., i, 971.
- ψ-Cumenol, coumarins from (CLAYTON), T., 2020.
- Cuminanisoin** (EKECRANTZ and AHLQVIST), A., i, 993.
- Cuminylidene carbamidoxime** (COSDUCHE), A., i, 155.
- ψ-Cumylcyanamide and its carbanide and benzoyl derivative (PIERSON), A., i, 925.
- 1-ψ-Cumyl-2-methylbenziminazole, 4:7-dinitro-6-hydroxy- (MELDOLA and HAY), T., 1677.
- Cuprammonium salts**. See under Copper.
- Cupric and Cuprous salts**. See under Copper.
- Curare**, action of, on nerve-endings (EDMUND and ROTH), A., ii, 966.
- Curcumin** methyl ether (CLARKE and JACKSON), A., i, 670.
- Current**. See under Electrochemistry.
- Cutaneous respiration**. See Respiration.
- Cutin**, cellulose, and lignin, separation of (KÖNIG; MATTHEB), A., ii, 236.
- Cyanamide**, preparation and supposed ammoniacal fermentation of (ULFANI), A., i, 859.
- constitution of (PALAZZO and SCIALI), A., i, 718.

- Cyanamide**, preparation of derivatives of (BAUM), A., i, 252.
- Cyanamides**, formation of (FROMM and WELLER), A., i, 703.
- aromatic monatomic (PIERRON), A., i, 925.
- iso***Cyanates**. See Carbimides.
- Cyanates**, thio-. See Thiocyanates.
- Cyanic acid**, thio-. See Thiocyanic acid.
- Cyanides**. See under Cyanogen.
- iso***Cyanides**. See Carbylamines.
- Cyanine dyes**, constitution of (VONGERICHTEN and HÖFCHEN), A., i, 914.
- iso***Cyanine dyes**, optical and sensitising properties of (SHEPPARD), P., 184.
- Cyanogen** bromide, action of, on arylaminoacetonitriles (v. BRAUN), A., i, 825.
- action of, on hydrazine (PELLIZZARI and REPETTO), A., i, 65.
- preparation of derivatives of (BAUM), A., i, 252.
- Cyanogen compounds**, constitution of certain (PALAZZO and SCELSI), A., i, 718.
- tautomerism of (GUILLEMARD), A., i, 718.
- Hydrocyanic acid** (*hydrogen cyanide*), synthesis of (WOLTERECK), A., i, 400.
- fission of, from amides of α -bromo-fatty acids accompanied by the formation of an aldehyde or ketone (MOSSLER), A., i, 133.
- mechanism of the action of (SCHROEDER), A., ii, 413.
- spectrophotographic investigations on the action of, on blood (LEWIN), A., ii, 1048.
- action of, on protein katabolism (LOEWY, WOLF, and ÖSTERBERG), A., ii, 312.
- formation of, in green plants (RAVENNA and PELI), A., ii, 217.
- transitory presence of, in ferns (GRESHOFF), A., ii, 725.
- Cyanides**, action of, on thiosulphonates (GUTMANN), A., i, 972.
- See also Metallic cyanides.
- Cyano group**, replacement of the sulphonic group by the, in azo-compounds (LANGE), A., i, 300.
- Cyano-mercury salts**. See under Mercury.
- Cyano-**. See also under the parent Substance.
- Cyanuric acid**, and thio-, constitution of (PALAZZO and SCELSI), A., i, 718.
- Cyclic compounds**, ultra-violet fluorescence of (LEY and v. ENGELHARDT), A., ii, 911.
- Cyclic groups**, polycarbon, relative stability of (HENRY), A., i, 831.
- Cystine**, conversion of *L*-serine into the natural optically active (FISCHER and RASKER), A., i, 325.
- estimation of, in urine (GASKELL), A., ii, 75.
- Cystinuria** with disamines (THIELE), A., ii, 971.
- protein metabolism in (WOLF, SHAFFER, ÖSTERBERG, and SONOGYI), A., ii, 717.
- Cytisine** and its derivatives (MAASS), A., i, 563.
- Cytolysis** and lipid liquefaction, relation between (KNAFFL-LENZ), A., ii, 610.
- Cytosine** (*4-amino-2-oxypyrimidine*), origin of, obtained by the hydrolysis of nucleic acids of animal origin (LEVENE and MANDEL), A., i, 376.
- action of diazobenzenesulphonic acid on (JOHNSON and CLAPP), A., i, 931.
- N*-alkyl derivatives, synthesis of (JOHNSON and CLAPP), A., i, 935.
- picrolonate of (WHEELER and JAMIESON), A., i, 253.
- iso***Cytosine** (*2-amino-6-oxypyrimidine*), picrolonate of (WHEELER and JAMIESON), A., i, 253.
- Cytosine-5-carboxylamide**, synthesis of, and its additive salts (WHEELER and JOHNS), A., i, 838.

D.

- Daidzu-abura**. See Soja bean oil.
- Damasceninic acid**. See 2-Methyl-amino-3-methoxybenzoic acid.
- Date**, invertase of the (VINSON), A., ii, 418, 724.
- Datura Meteloides*, meteloidine from (PYMAN), T., 2077; P., 234.

- Dehydrocamphenylic acid** and its ethyl ester, salts, amide, and anilide (KOMPPA and HINTIKKA), A., i, 852.

- Dehydrocholestanedionol** (*oxycholestanedionol*), formation of (PICKARD and YATES), T., 1684; P., 121.
- Dehydrocorydaline** from Chinese *Corydalis tubers* (MAKOSHI), A., i, 825.
- Dehydrodieugenol** and its diacetyl and dibenzoyl derivatives (COUSIN and HÉRISSEY), A., i, 727.
- Dehydrodieugenol** and its diacetyl and dibenzoyl derivatives (COUSIN and HÉRISSEY), A., i, 783.
- Dehydrositostanedionol**, **Dehydrositostenedione** and its phenylhydrazones, and **Dehydrositostanedione** and its dioxime (PICKARD and YATES), T., 1931; P., 227.
- Dehydrositostanetriol** and its acyl derivatives (PICKARD and YATES), T., 1930; P., 227.
- Delorenzite** from Craveggia, Piedmont (ZAMBONINI), A., ii, 604.
- Denitrification**, ten years' experiments on, in arable soil (AMPOLA), A., ii, 525.
- Densities**, limiting, application of the method of, to organic vapours (GUYE), A., ii, 86.
- orthobaric, of homologous liquids (TER-GAZARIAN), A., ii, 666.
- Density**, hardness, chemical composition, and crystalline form, relation between (POSCHL), A., ii, 673.
- of the alkali and alkaline-earth iodides (BAXTER and BRINK), A., ii, 377.
- of liquids below zero (TIMMERMAN), A., ii, 85.
- of fused salts (ARNDT and GESSLER), A., ii, 923.
- of some fused salts and their mixtures at various temperatures (LORENZ, FREI, and JABS), A., ii, 156.
- of solids, use of the micro-balance for the measurement of (BRILL and EVANS), T., 1442; P., 185.
- laboratory apparatus for the determination of (GREEN), A., ii, 826.
- apparatus. See also Pycnometer.
- See also Vapour density.
- Deoxyxanthines**, hydrolysis of (TAFEL and MAYER), A., i, 742.
- Dephlegmator**, new, for the fractionation of naphtha (HERR), A., ii, 232.
- Desmotroposantonin**. See under Santonin.
- Desmotropy** and merotropy (MICHAEL; MICHAEL and SMITH), A., i, 943; (MICHAEL and COBB), A., i, 947.
- Deutero-albumose** (HASLAM), A., i, 71.
- Dextrin** from honey from coniferous plants, molecular weight of (BAR-SCHALL), A., i, 767.
- Dextrose** (*d-glucose*), osmotic pressure of solutions of, at 10° (MORSE and HOLLAND), A., ii, 759.
- the function of the phosphates in the fermentation of, by yeast-juice (HARDEN and YOUNG), A., i, 539.
- oxidation of (NEF), A., i, 7.
- behaviour of, towards dilute sodium hydroxide (MEISENHEIMER), A., i, 319.
- action of zinc dust on (LOB), A., i, 764.
- in cat's saliva (CARLSON and RYAN), A., ii, 403.
- consumption of, by mammalian cardiac muscle (LOCKE and ROSENHEIM), A., ii, 120.
- derivatives, constitution of (LAVINE and GILMOUR), T., 1429; P., 188.
- and sodium iodide, preparation of an anhydrous crystalline compound of (WÜLFING), A., i, 765.
- Barfoed's acid cupric acetate solution as a means of distinguishing from lactose, maltose, and sucrose (HINKEL and SHERMAN), A., ii, 235.
- detection of, in urine (OTTO), A., ii, 739.
- comparative investigations on various reduction processes for the estimation of (KINOSHITA), A., ii, 437.
- Dextrose-*o*- and -*m*-nitrophenylhydrazones and -osazones** (RECLAINE), A., i, 1014.
- Dextrosephenylhydrazones** (BLEHND and LOHR), A., i, 765.
- Dextrosephenylosazone**, behaviour of, in the organism (PIGORINI), A., ii, 876.
- Diabetes** (*glycosuria*), production of, in rabbits by intravenous injection of sea water made isotonic with the blood (BURNETT), A., ii, 213.
- action of radium emanations in (POULSSON), A., ii, 1657.
- carbon dioxide in venous blood and alveolar air in cases of (BEDDARD, PEMBREY, and SPRIGGS), A., ii, 718.
- experimental (MACLEOD), A., ii, 779.
- morphine (SPITTA), A., ii, 972.
- pancreatic, acidosis in (ALLARD), A., ii, 1058.
- nitrogenous and inorganic metabolism in, in dogs (FALTA and WHITNEY), A., ii, 213.
- influence of muscular work on the excretion of sugar in (*Seo*), A., ii, 1058.
- in selachian fishes (DIAMARE), A., ii, 519.

- Diabetes** (*glycosuria*), phloridzin, influence of diuretics on (LOEWI and NEUBAUER), A., ii, 718.
 excretion of sodium chloride in (BIBERFELD), A., ii, 972.
 influence of cold and exercise on sugar excretion in (LUSK), A., ii, 612.
 production of sugar from glutamic acid ingested in (LUSK), A., ii, 612.
 salt, mechanism of (UNDERHILL and KLEINER), A., ii, 409.
- Diabetes mellitus**, prosecretin in relation to (BAINBRIDGE), A., ii, 213.
 function of the pancreas in (LOEWI), A., ii, 712.
 degradation of fatty acids in (BAER and BLUM), A., ii, 1057.
- Diacet-**. See also **Diacetyl-**, and under the parent Substance.
- Diacetanilide**, *s*-*tr*ibromo- and 2:6-dichloro-4-nitro- (SMITH and ORTON), T., 1250.
- Diacetanilides**, formation of (SMITH and ORTON), T., 1246; P., 132.
- Diacetone alcohol**, aminolactones from (KOHN), A., i, 819.
- Diacetonitrile**, condensation of (v. MEYER and HENNING), A., i, 910.
 action of arylamines and hydrazine derivatives on (v. MEYER, SCHUMACHER, and LEHMANN), A., i, 909.
- Diacetonitrile**, amino-, *N*-benzoyl derivative of (v. MEYER and LEHMANN), A., i, 910.
- 10-Diacetoxy-2-methoxybrazan** (v. KOSTANECKI and LAMPE), A., i, 907.
- diacetoxy-**. See also under the parent Substance.
- Diacetyl** (*dimethyl diketone*) monosemicarbazone and its sodium salt (BILTZ and HORMANN), A., i, 516.
- 4'-Diacetylphenylmethane** (DUVAL), A., i, 277.
- 2:2'-diamino-, 2:4:2':4'-tetraamino-, and 2:2'-dinitro-** (DUVAL), A., i, 657.
- Diacetylglyoxylic acid**, action of, on aniline and its homologues (v. OSTROMISLENSKY), A., i, 889.
- Diacetylloximesemicarbazone** and its acetate (BILTZ and HORMANN), A., i, 516.
- diacetyl-**. See also under the parent Substance.
- alkylaminodimethylethylcarbinols** and their benzoyl derivatives, preparation of the alkyl halides of (RIEDEL), A., i, 607.
- 5:5-Dialkylbarbituric acids**, preparation of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 292; (CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING), A., i, 370, 1017; (EINHORN; BOEHRINGER & SÜHNE), A., i, 464.
- p-Dialkylbenzoquinones**, dihydroxy-, synthesis of (FICHTER, JETZER, and WEISS), A., i, 659.
- Dialkylglycollic acids**, cyanamides and ureides of (CLEMMENSEN and HEITMAN), A., i, 771.
- αα-Dialkyl-β-keto-alcohols** (BLAISE and HERMAN), A., i, 596.
- αs-Dialkylmallo esters**, new synthesis of (RASSOW and BAUER), A., i, 316.
- Dialkylloxalacetic esters**, new synthesis of (RASSOW and BAUER), A., i, 316.
- 2:6-Dialkylxyphenols**, preparation of carbamates of (BASLER CHEMISCHE FABRIK), A., i, 635.
- Dialkylphthalides** (BAUER), A., i, 274.
- Dialysis**. See under Diffusion.
- Diamide**, *dicyano-*. See **Dicyanodiamide**.
- Diaminodicarboxylic acids**, synthesis of (SØRENSEN and ANDERSEN), A., i, 649.
- Diamond**, summary of information as to the artificial production of (THREFFALL), T., 1351; P., 131.
 conversion of, into coke in high vacuum by cathode rays (PARSONS and SWINTON), A., ii, 275.
- Disoamyl sulphoxide**, preparation of (GAZDAR and SMILES), T., 1834; P., 216.
- β-Diamylaminoethyl benzoate** and its hydrochloride and oxalate (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 167.
- Disoamylaminoethyl benzoate** and hydrogen oxalate (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 266.

- Dianilinoacetic acid** and its rearrangement (v. OSTROMISLENSKY), A., i, 889.
- Dianilindibenzyl** and its diacetyl and dibenzoyl derivatives (ANSELMINO), A., i, 259.
- Dianilidithiobiuret** (FROMM and BAUMHAUER), A., i, 702.
- Di-p-anisyl sulphoxide** (KNOEVENAGEL and KENNER), A., i, 971.
- p-Dianisylamine** and its nitrosoamine (WIELAND), A., i, 1016, 1026.
- α-Dianisylbutyric acid**, β-iodo-γ-hydroxy-, lactone of (BOUGAULT), A., i, 538.
- Dianisylhydrazine** and its hydrochloride (WIELAND), A., i, 1026.

- Dianisylidenedi-*p*-methoxy-*N*-amino-stilbene** (FISCHER and PRAUSE), A., i, 220.
- Dianthranol meso-ether, 1:4:1':4'- and 2:3:2':3'-tetrahydroxy-** (v. LIEBIG), A., i, 727.
- a*-Dianthraquinonyl**, preparation of anthracene derivatives from (SCHOLL), A., i, 428.
- Dianthraquinonyl derivatives**, chlorination of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 198.
- Dianthraquinonyl-*N*-aminoanthraquinones**, complex, preparation of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 807.
- Diastase** in cat's saliva, the (CARLSON and RYAN), A., ii, 606.
- in human saliva (MESTREZAT), A., ii, 606.
- scission of lactose, maltose, and their derivatives by (BIERRY and GIAJA), A., i, 1031.
- reactions of (SCHNEIDWIND, MEYER, and MÜNTER), A., ii, 879.
- preparations, proposed method for the routine valuation of (JOHNSON), A., ii, 743.
- Diastases**, investigation of (WOHLGEMUTH), A., ii, 403.
- Diazoacetamide**, action of hydrazine hydrate on (CURTIUS, DARAPSKY, and BOCKMÜHL), A., i, 144.
- Diazoacetic acid**, ethyl ester, kinetics of, and the dilution law (MUMM), A., ii, 469.
- action of alkalis on (CURTIUS, DARAPSKY, and MÜLLER), A., i, 924.
- action of hydrazine hydrate on (CURTIUS, DARAPSKY, and BOCKMÜHL), A., i, 144.
- reaction of, with *m*-xylene (BUCHNER and DELBRÜCK), A., i, 87.
- iso*-Diazoacetic acid**, ethyl ester, so-called (CURTIUS, DARAPSKY, and MÜLLER), A., i, 923.
- ψ -Diazoacetic acid** and its salts (MÜLLER), A., i, 922.
- Diazoaminotoluene** cobaltinitrite (HOFMANN and BUCHNER), A., i, 876.
- Diazobenzene**, action of, on glutaric acid and its ethyl ester (HENRICH and THOMAS), A., i, 114.
- p*-amino-, bromide, *N*-acetyl derivative of (BÉLOW and SCHMACHTENBERG), A., i, 744.
- Diazobenzene** (*benzenediazonium*)* bromide, preparation of (CHATTAWAY), T., 959.
- per*bromides**, bromination by means of (BÉLOW and SCHMACHTENBERG), A., i, 743.
- Diazobenzene chloride**, rate of decomposition of (CAIN and NICOLL), P., 292.
- iso*-Diazobenzene salts**, preparation of (STOLLÉ), A., i, 917; (THIELE), A., i, 927.
- Diazo-chlorides**, action of, on α - and γ -bromoacetoacetic esters (FAVREL), A., i, 209.
- Diazo-compounds**, Cain's theory of (HANTZSCH), A., i, 1021.
- behaviour of, with ketonic and enolic compounds (TINGLE and WILLIAMS), A., i, 126.
- iso*-Diazo-compounds** (*isonozotates*), aromatic and fatty, from hydrazines (THIELE), A., i, 927.
- Diazo-group**, position of entrance of the, in the formation of azo-dyes (SCHARWIN and KALJANOFF), A., i, 704.
- p*-Diazoinobenzene**, derivatives of (MORGAN and MICKLETHWAIT), T., 602; P., 48.
- Diazomethane**, action of, on the two modifications of isomitroscamphor (FORSTER and HOLMES), T., 242; P., 8.
- action of, on hydroxyazo-compounds (SMITH and MITCHELL), T., 542; P., 70.
- and alkyl haloids, reactions of, with tautomeric acids and salts (ACREZ, JOHNSON, BRUNEL, SHADINGER, and NIRDLINGER), A., i, 919.
- 1-Diazo-8-naphtholsulphonic acids**, salts, preparation of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 231.
- Diazonium** bromides, new general method of preparing (CHATTAWAY), T., 958; P., 93.
- per*bromides, constitution of (CHATTAWAY), P., 172.
- salts, quantitative conversion of aromatic hydrazines into (CHATTAWAY), T., 852; P., 74.
- reaction of, with mono- and dihydric phenols and with naphthols (ORTON and EVERATT), T., 1010; P., 118.
- Diazophenylarsinic acid** and its products of decomposition (BERTHEIM), A., i, 591.
- Diazo-reaction**, study of, in the diphenyl series (MORGAN and MICKLETHWAIT), T., 614; P., 51.
- Diazo-salts**, interaction of, with aromatic amides of the higher fatty acids (SULZBERGER), A., i, 483.
- reaction of, with azo-dyes (LWOFF; GRANDMOUGIN), A., i, 483.
- action of, on primary dinitrohydrocarbons (PONZIO and CHABRIER), A., i, 582.

- Diazo-salts**, action of, on ω -dinitrotoluene (PONZO), A., i, 482.
- Diazo-solutions**, decomposition of (HANTZSCH and THOMPSON), A., i, 1021.
- Diazotoluene** (*toluenediazonium*) bromides, *o*- and *p*-, preparation of (CHATTAWAY), T., 960.
- Dibenzenesulphonimide** and its salts (HAGA), A., i, 870.
- Dibenzenesulphonylhydroxamic acid**. See Diphenylsulphonylhydroxylamine.
- Dibenzospiropyran** (DECKER and FELSER), A., i, 906.
- Dibenzopyrrolinium derivatives** (DECKER and FEISER), A., i, 1003.
- Dibenzoyl**. See Benzil.
- p*-Dibenzoylbenzene**, amino-derivatives of (GUYOT and PIGNET), A., i, 569.
- Dibenzoylcarbamide**, *s-di-p*-bromo- (BILTZ and RIMPEL), A., i, 574.
- Dibenzoyldimethylcarbamide** (BILTZ and RIMPEL), A., i, 464.
- 3:6-Dibenzoyl-2:5-dimethylpyrazine** and its dioxime (SONN), A., i, 56.
- 3:4:5:6-Dibenzoylene-1-phenylbenzene-2' carboxylic acid** and its ethyl ester (ERRERA), A., i, 185.
- α -Dibenzoyl- α -methoxydibenzyl** and its reactions (IRVINE and McNICOLL), T., 956; P., 119.
- Di- β -benzoyloxy-1:4-diethylpiperazine** and its additive salts and physiological action (PYMAN), T., 1795; P., 208.
- γ -Dibenzoyloxydiethylpropylamine** and its additive salts and physiological action (PYMAN), T., 1794; P., 208.
- γ -Dibenzoyloxydimethylpropylamine** and its additive salts and physiological action (PYMAN), T., 1794; P., 208.
- $\beta\beta$ -Dibenzoyloxymethyldiethylamine** and its additive salts and physiological action (PYMAN), T., 1794; P., 208.
- γ -Dibenzoyloxy-1-propylpiperidine** and its additive salts and physiological action (PYMAN), T., 1794; P., 208.
- $\beta\beta$ -Dibenzoyloxytriethylamine** and its additive salts and physiological action (PYMAN), T., 1794; P., 208.
- Dibenzoyltartramide** (EINHORN), A., i, 611.
- Dibenzoyl**. See also under the parent Substance.
- Dibenzyl diselenide** (PRICE and JONES), P., 184.
- disulphide**, preparation of (PRICE and TWISS), T., 1399.
- sulphoxide**, preparation of (GAZDAR and SMILES), T., 1835; P., 216.
- Dibenzylacetic acid**, methyl ester (DIECKMANN and KRON), A., i, 388.
- Dibenzylaspartic acid**, optically active, synthesis of (LUTZ), A., i, 345.
- p*-Dibenzylbenzoquinone**, *dihydroxy*-, and its diacetate (FICHTER and WEISS), A., i, 659.
- Dibenzylcampholides**, isomeric, and their separation (HOUBEN and HAHN), A., i, 540.
- Dibenzyl-diethylthioninedisulphonic acid** (GNEHM and SCHÖNHOLZER), A., i, 113.
- 9:10-Dibenzyl-dihydrophenanthrene**, 9:10-*dihydroxy*-, and its oxide (ZINCKE and TROPP), A., i, 787.
- 3:6-Dibenzyl-2:5-dimethylpyrazine** and its additive salts (SONN), A., i, 56.
- Dibenzyl-dimethylthioninedisulphonic acid** and its salts (GNEHM and SCHÖNHOLZER), A., i, 113.
- 9:10-Dibenzyl-10-ethyl-dihydrophenanthrene**, 9-hydroxy- (ZINCKE and TROPP), A., i, 787.
- Dibenzylethyl-silicic acid** and **-silicic oxide** (ROBISON and KIPPING), T., 449; P., 25.
- Dibenzylhydroxycampholic acids**, isomeric (HOUBEN and HAHN), A., i, 540.
- Dibenzylidenediaminostilbene** (FISCHER and FRAUEN), A., i, 219.
- Dibenzylidenedimethoxydiaminostilbene** (FISCHER and FRAUEN), A., i, 220.
- Dibenzylidenecyclopentanone** (KAUFFMANN), A., i, 986.
- Dibenzylidene-1:3-phenylenedihydrazine** (FRANZEN and EICHLER), A., i, 831.
- Dibenzylidenepropiophenone** (WIELAND and STENZL), A., i, 86.
- Dibenzylidenethiocarbohydrazide** and **dinitro**- (STOLLE and BOWLES), A., i, 474.
- Dibenzylmalamic acid**, synthesis of, and its silver salt (LUTZ), A., i, 345.
- Dibenzylphosphinic acid**, *dihydroxy*-, ethyl ester, diphenylurethane of, and aniline salt (VALLEE), A., i, 976.
- Dibenzylrongalite** (FROMM and GAUFF), A., i, 970.
- Dibenzylsilicic acid**, α - and β - (ROBISON and KIPPING), T., 448; P., 25.
- Dibenzylsilicon dichloride** (ROBISON and KIPPING), T., 451; P., 25.
- Dibenzylsilicone** and its termolecular compound (ROBISON and KIPPING), T., 439; P., 25.
- Di-3:5-dibromobenzylmalonic acid**, ethyl ester (WHEELER and CLAPP), A., i, 898.

- Anodic polarisation**, anomalous, by nitric acid (SCHELLHAAS), A., ii, 249.
- Cathode**, Wehnelt, in high vacua (SODDY), A., ii, 81; (WEHNELT), A., ii, 147; (LILIENFELD), A., ii, 248.
- Cathode potential** fall in some compound gases (GEHLHOFF), A., ii, 11.
- Cathodic volatilisation** in attenuated gases (KOHLSCHÜTTER and GOLDSCHMIDT), A., ii, 457; (FISCHER and HÄHNEL), A., ii, 653, 800, 925; (KOHLSCHÜTTER), A., ii, 799, 800, 925; (WALTER), A., ii, 925.
- Electrodes**, electrolytic depositions on inclined (GOLDSCHMIDT), A., ii, 536.
- alkali (MULLER and ALLEMANDET), A., ii, 146.
- aluminium, gas generated from (v. HIRSCH and SODDY), A., ii, 12; (v. HIRSCH), A., ii, 925.
- binary, and electrochemical adsorption (MICHAELIS), A., ii, 655.
- bromine or chlorine, for use at high temperatures (LORENZ and FOX), A., ii, 856.
- behaviour of calcium and sodium amalgams as, in solutions of neutral salts (BYER), A., ii, 926.

ELECTROCHEMISTRY:—

- Electrodes, hydrogen, potential of, in acid and alkaline solutions (SCHMIDT and FINGER), A., ii, 802.
- anomalous behaviour of, in solutions of lead salts (DENHAM and ALLMAND), T., 424; P., 14.
- metal, electric arc between (CADDY and ARNOLD), A., ii, 10.
- nickel oxide, in the Jungner-Edison accumulator (ZEDNER), A., ii, 12.
- nickel peroxide (FORSTER), A., ii, 146, 147.
- nitric oxide (GRASSI), A., ii, 801.
- Electrode potential in liquid ammonia (JOHNSON and WILSMORE), A., ii, 455.
- Electrode potentials, measurement of (KISTIAKOWSKY), A., ii, 249.
- Electrolysis, reversed (TURRENTINE), A., ii, 804.
- of chlorides (BROCHET), A., ii, 491.
- of hot porcelain, validity of Faraday's law in the (HABER, RIEFF, and VOET), A., ii, 254.
- Electrolyte, calculation of the dissociation of an (LEWIS), A., ii, 657.
- Electrolytes, conductivity and ionisation of, in aqueous solutions, as conditioned by temperature, dilution, and hydrolysis (JONES and JACOBSEN), A., ii, 1011.
- limiting conductivity of some, in ethyl alcohol (DUTOIT and RAPPEPORT), A., ii, 924.
- variation of the degree of dissociation of, with temperature (CAMPETTI), A., ii, 1010.
- diffusion of, in aqueous solution (VANZETTI), A., ii, 88.
- diffusion of, in aqueous solutions and in gelatin (VANZETTI), A., ii, 20.
- action of, on colloidal silver solutions (WOUDSTRA), A., ii, 160; (LOTTERMOSE), A., ii, 365.
- amphoteric (HOLMBERG), A., ii, 560.
- solid, and their decomposition by a current and their electromotive properties in galvanic chains (HABER, BRUTNER, and BIRSTEIN), A., ii, 802.
- strong (CUMMING), A., ii, 253.
- anomaly of the strong univalent (KATAYAMA), A., ii, 926.
- undissociated, reactivity of (WEGSCHIEDER), A., ii, 265.
- weak, with negative heat of dissociation, effect of concentration on the temperature of maximum electrolytic conductivity of (WEGELIUS), A., ii, 801.

ELECTROCHEMISTRY:—

- Electrolytic analysis. See under Analysis.
- Electrolytic chlorination. See Chlorination.
- Electrolytic conduction, examination of the conception of hydrogen ions in (LAPWORTH), T., 2187; P., 275.
- Electrolytic conductivity of weak electrolytes with negative heat of dissociation, effect of concentration on the temperature of maximum (WEGELIUS), A., ii, 801.
- of colloidal solutions, influence of radium on the (ZBOICKI), A., ii, 451.
- Electrolytic decomposition of dicarboxylic organic acids (VANZETTI), A., i, 939.
- Electrolytic depositions on inclined electrodes (GOLDSCHMIDT), A., ii, 536.
- Electrolytic dissociation of the polyiodides of the alkali metals and ammonium radicles (DAWSON and JACKSON), P., 2063; P., 213.
- Electrolytic preparation of alkali chlorates and perchlorates (COULLERU), A., ii, 689.
- Electro-syntheses (LOSANITSCH), A., i, 846, 866; ii, 32.
- Electromotive force of iodine concentration cells in water and alcohol (LAURIE), A., ii, 1007.
- of liquid chains, variation of, by polarisation of interposed diaphragms (GIRARD), A., ii, 456.
- Electromotive forces, thermodynamic calculation of (HALLA), A., ii, 755.
- Photo-electric sensitiveness and fluorescence of organic substances (STARK and STEUBING), A., ii, 746.
- Electron, the, as an element (RAMSAY), T., 774; P., 87.
- charge of the, and size of molecules (FERRIN), A., ii, 927.
- Electrons, emission of, by heated metallic oxides (JENTZSCH), A., ii, 652.
- positive (BECQUEREL), A., ii, 751; (BESTERMAYER), A., ii, 799.
- Electron theory and optical properties (ERFLE), A., ii, 77.
- and valency (STARK), A., ii, 138; (KAUFFMANN), A., ii, 478.
- Ionisation, part played by, in certain chemical reactions (OCHSNER DE CONINCK), A., ii, 804.
- and conductivity of acids, bases, and salts in aqueous solutions at high temperatures (NOYES, MELCHER, COOPER, EASTMAN, and KATO), A., ii, 347.

ELECTROCHEMISTRY:—

- Ionisation and conductivity of electrolytes in aqueous solutions** as conditioned by temperature, dilution, and hydrolysis (JONES and JACOBSON), A., ii, 1011.
- of gases by α -rays, and the hypothesis of initial recombination of the ions (MOULIN), A., ii, 921.
- of liquid dielectric media by radium rays (JAFFÉ), A., ii, 148.
- secondary, quality of, due to β -rays (BRAGG and MADSEN), A., ii, 921.
- Ionisation constants**, secondary, of dibasic acids, determination of the (McCoy), A., ii, 486; (CHANDLER), A., ii, 467; (WEGSCHEIDER), A., ii, 1009.
- Ionisation phenomena**, influence of pressure on, produced in gases by X-rays (ROTHÉ), A., ii, 1007.
- produced by snow (COSTANZO and NEGRO), A., ii, 551.
- Ionic concentrations**, calculation of, from measurements of potential in concentration cells (LEWIS), A., ii, 657.
- Ionic experiments** on metals in liquid ammonia (KRAUS), A., ii, 835.
- Ionic mobility**, elucidation of the connexion between, and the fluidity of the solution (GREEN), T., 2049; P., 187.
- and temperature coefficient, relation between (RASCH and HINRICHSSEN), A., ii, 148.
- abnormal, of some rare earths (ROUX), A., ii, 149.
- Ionic mobilities in water**, temperature-coefficients of, as a function of the mobilities (KOHLENSCH), A., ii, 264.
- Ionic reactions**, influence of the velocity of, on the current-potential curve (EUCKEN), A., ii, 1008.
- Ionic volume and viscosity** (GETMAN), A., ii, 931.
- Ionising power** and dielectric power of solvents, relation between the (McCoy), A., ii, 657.
- Ionising solvent**, antimony trichloride as (KLEMENSIEWICZ), A., ii, 1043.
- Ions**, genesis of, by collision of positive and negative ions in a gas (GILL and PIDDECK), A., ii, 798.
- emitted by hot substances, specific charge of (RICHARDSON), A., ii, 1009.
- experiments to ascertain the molecular complexity of (CHATTOCK and TYNDALL), A., ii, 652.

ELECTROCHEMISTRY:—

- Ions**, determination of the hydration of, by transference, in presence of a non-electrolyte (WASHBURN), A., ii, 1009.
- determination of the hydration of, from measurements of electromotive forces (LEWIS), A., ii, 805.
- migration of, in heterogeneous systems (SPIRO and HENDERSON), A., ii, 804.
- gaseous, diffusion of (SALLES), A., ii, 931.
- metallic, action of, on the frog's heart (GAUTRELET), A., ii, 120.
- negative, emission of, by heated metals and by heated calcium oxide (DEININGER), A., ii, 834.
- Potential of a hydrogen electrode** in acid and alkaline solutions (SCHMIDT and FINGER), A., ii, 802.
- Potentials**, discharge, of the ions in solutions of alkali alkylloxides (CARARA and BILINGHENT), A., ii, 755.
- Potential differences** at the contact of two electrolytes; Nernst's theory (GUYOT), A., ii, 656.
- contact, determined by means of null solutions (SMITH and MOSS), A., ii, 843.
- and the stability of the alternating are between metals (GUYE and BRON), A., ii, 561.
- Potential series**, aluminium in the (VAN DEVENTER and VAN LEMMEL), A., ii, 12, 558; (VAN LAAR), A., ii, 248, 558.
- Transference numbers**, improved apparatus for the measurement of, in solutions of the halogen acids and their salts (WASHBURN), A., ii, 805.
- Voltameter**, a lecture (PITONI), A., ii, 657.
- copper, anomalous behaviour of the (MEYER), A., ii, 803.
- electrolytic gas (LEHFELDT), A., ii, 559.
- Micro-voltameter**, silver (BOSE and CONRAT), A., ii, 250.
- Element**, new conception of the (MIEL), A., ii, 478.
- supposed formation of new (JUVITSCHITSCH), A., i, 118.
- Elements**, new, in thorionite (EVANS), T., 666; P., 60; (OGAWA), A., ii, 952, 953.
- evolution and devolution of the A. C. and A. E. JESSUP, A., ii, 96.
- atomic weights of the (WILDE), A., ii, 1027.

- Elements, certain relations between the atomic weights of the (DELAUNAY), A., ii, 97.
- periodicity, weight, and valency of the (WOODRUISS), A., ii, 368.
- and compounds, wave-length tables of the spectra of the (BRITISH ASSOCIATION REPORTS), A., ii, 334.
- potential energy of the (RANKIN), A., ii, 680.
- specific heat of the, between the temperature of liquid air and room temperature (NORDMEYER), A., ii, 353.
- energy of the (BEKETOFF), A., ii, 478.
- action of iodine on some, in vacuum (GUICHARD), A., ii, 31.
- solid, specific heat of, and Dulong and Petit's law (WIGAND), A., ii, 13; (ROHLAND), A., ii, 459; (RICHAUD), A., ii, 562, 559.
- non-metallic, valency and specific gravity of (WOODRUISS), A., ii, 574.
- See also Metalloids.
- phosphorescent, and meta-elements of Sir W. Crookes, nature of the (URBAIN), A., ii, 108.
- Elemicin and *iso*Elemicin, constitution of (SEMMLER), A., i, 558, 664.
- from elemli oil (SEMMLER), A., i, 557.
- Ellagic acid, preparation and constitution of (HWEZIG, POLAK, and v. BRONNECK), A., i, 546.
- Emission spectra. See under Photochemistry.
- Emodin (trihydroxy-2-methyl-9:10-anthraquinone) from Frangula from aloes, trimethyl ethers of (OESTERLE and TISZA), A., i, 350.
- Emodins, constitution of the (OESTERLE and TISZA), A., i, 905.
- Emodinanthranol (HESSE), A., i, 439.
- Emphloin from the kinos of the Eucalyptus (SMITH), A., ii, 886.
- Emulsin, hydrolysis of amygdalin by (AULD), T., 1251, 1276; P., 97, 181; (ROSENTHALER), A., i, 197, 817; (FEIST), A., i, 437, 903.

- α -Ethoxypropylbenzene, γ -chloro- (HOUBEN and FÜHRER), A., i, 74.
- α -Ethoxystyrene (RIFFENEAU), A., i, 19.
- 9-Ethoxy- Δ^{10} -tetrahydrocarbazole (BORSCH, WITTE, and BOTH), A., i, 366.
- Ethoxytolualdehydes and their derivatives, synthesis of (GATTERMANN), A., i, 32.
- 1-Ethoxy-1,2:3-triphenylindene (KÖHLER), A., i, 777.
- o*-Ethoxytritanol-6-sulphonic anhydride (v. LIEBIG and HERD), A., i, 450.
- Ethyl alcohol, preparation of, from substances containing cellulose (KÖRNER), A., i, 955.
- absolute, preparation of, and refractive indices of mixtures of, with water (ANDREWS), A., ii, 333.
- and water, index of refraction of mixtures of (DOROSCHESKY and DVORSCHANTSCHIK), A., ii, 241; (ANDREWS), A., ii, 333.
- electrical conductivity of mixtures of, with water (DOROSCHESKY and ROSCHDESTVENSKY), A., ii, 800.
- and its mixtures with water, specific heat of (DOROSCHESKY and RAKOWSKY), A., ii, 807.
- changes of specific heat of, dissolved in liquid hydrocarbons (SHREDER), A., ii, 460.
- viscosity of (GAILLARD), A., i, 72.
- tables for converting percentages of, by volume into percentages by weight (BLONDEAU), A., ii, 738.
- oxidation of, by a contact process (ORLOFF), A., i, 306.
- and water, composition of the vapour from mixtures of (MASING), A., i, 751.
- action of, on the heat relationships of the animal organisms (HARNACK and LAIBLE), A., ii, 404.
- effect of, on digestion (ZITOWITSCH), A., ii, 404.
- tolerance to (PRINGSHEIM), A., ii, 767.
- detection and estimation of small quantities of benzene in (HOLME and WINTERFELD), A., ii, 435.
- indirect estimation of, by refraction (FRANK), A., ii, 637.
- estimation of, in concentrated ethyl nitrite (PEARSON), A., ii, 436.

- Ethyl alcohol**, estimation of, in fermented liquids (AUGERT), A., ii, 802, and extract; estimation of, in spirits by the refractometer (RACON), A., ii, 738.
- estimation of, in *vins* (DEBOUX and DUTOIT), A., ii, 136.
- Ethyl alcohol, difluoro-**, preparation of (SWARTS), A., i, 762.
- Ethyl cuprocyanide** (GUILLEMARD), A., i, 720.
- cyanide**; preparation of (ÄTGER), A., i, 81.
- ethyl ether**, measurement of the ratio of the two specific heats of, with the help of Kundt's dust figures (DÖSSING), A., ii, 153.
- action of bromine on (MAUGUIN), A., i, 941.
- contact oxidation of (ORLOFF), A., i, 753.
- anesthesia, effect of, on nitrogen excretion (HAWK), A., ii, 410.
- ethyl nitrite**, estimation of alcohol in concentrated (PEARSON), A., ii, 436.
- phosphite-platichloride, compound formed by the addition of ammonia to (HERTY and DAVIS), A., i, 598.
- orthosilicate**, action of Grignard reagents on (KHOTINSKY and SEREGENKOFF), A., i, 1032.
- sodium thiosulphate, action of alkalis on (GUTMANN), A., i, 497.
- ethylamine**, catalytic action of (BRUNER and RAPIN), A., i, 863.
- action of, on isatin (HASLINGER), A., i, 454.
- action of *n*-propyl chloride on (COMANDUCCI and ARENA), A., i, 138.
- Ethylaminoacetacetic acid**, α -cyano-, ethyl ester and its salts (BENARY), A., i, 801.
- ethylaminobenzaldehydephenylhydrazones**, liquid crystals of (ROTARSKI), A., i, 640.
- ylaniline** picrate (VIGNON and VIEUX), A., ii, 685.
- ylanilopyrines**, 2- and ψ -, and their derivatives (MICHAELIS and MIECKE), A., i, 61.
- ethylbarbituric acid**, preparation of (BOEHRINGER and SÖHNNE), A., i, 464.
- electrolytic reduction of (TAFEL and THOMPSON), A., i, 53.
- ethylbenzaldehyde**, *p*-hydroxy-, and sazine, synthesis of (GATTERMANN), A., i, 28.
- ethylbenzhydramine** and its hydrochloride and nitrate (BUSCH and REEHMEL), A., i, 153.
- Ethylcyclobutane** (ZELINSKY and GUTT), A., i, 617.
- Ethylglutaric acid**, γ -chloro- α -hydroxy-, ethyl ester and its acid anhydride (MAIRE), A., i, 248.
- Ethylbutyrolactone- γ -carboxylic acid** and its ethyl ester (MAIRE), A., i, 248.
- α -Ethylbutyryldiethylglycylmethylenediamine** (EINHORN), A., i, 610.
- Ethylcatechol**, *dichloro*-, cyclic carbonates of (BARGER), T., 2081; P., 237.
- α -Ethylcrotonamide** and its dibromide (MANNICH and ZERNIK), A., i, 399.
- Ethyl β -diethylaminoethyl ketone** and its semicarbazone and picrate and its reduction (BLAISE and MAIRE), A., i, 398.
- Ethyl-di-*n*-propylamine** and its additive salts (COMANDUCCI and ARENA), A., i, 139.
- Ethylene**, thermal decomposition of (BONE and COWARD), T., 1197; P., 167.
- condensation product from, by means of the dark electric discharge (JOVITSCHITSCH), A., i, 118.
- condensation products, absorption of oxygen by (LOSANITSCH), A., i, 346.
- derivatives, methylation in, from the point of view of volatility (HENRY), A., i, 752.
- Ethylene**, tribromo- and trichloro-, mercuric derivatives of (HOFMANN and KIRMREUTHER), A., i, 145.
- tetraiodo**-, crystal form of (JAEGER), T., 523; P., 29.
- Ethylene glycol**, colour of (SPRING), A., i, 118.
- compounds of, with metallic salts (GRÜN and BOCKISCH), A., i, 934.
- ether of, pressure and composition of the vapours of aqueous solutions of (MAKOVETZKI), A., i, 753.
- Ethylene glycol-chlorohydrin ether**. See β -Ethoxybutane, α -chloro-.
- Ethylene oxides**, action of magnesium organic compounds on (FOURNEAU and TIFFENEAU), A., i, 163.
- Ethylene-blue**. See Tetraethylthionine.
- amino-, bromo-, and nitro-, and their salts (GNEHM and SCHINDLER), A., i, 111.
- Ethylenediamine cobalt thiocyanate**, action of iodine on (PFEIFFER and TILGNER), A., i, 614.
- compounds of, with chromium salts (PFEIFFER), A., i, 79; (PFEIFFER, PRADE, and STERN), A., i, 506; (PFEIFFER, VORSTER, and STERN), A., i, 507.

- Ethylenediamine, compounds of, with osmium and cobalt salts (FRANKE, CROGAN and HIRSH), A., i, 368.
- Ethylenediaminecarboxylic acids. See Diaminecarboxylic acids.
- Ethylenediamide and its additive salts (LITTLE), A., i, 324.
- Ethylene-green. See Ethylene-blue, nitro.
- Ethylene-sulphur, tetraiodo- (AUGER), A., i, 241.
- Ethylglycollic acid, glucinum salt (GLASMAN and NOVICKY), A., i, 321.
- Ethyl groups, twin, pharmacological significance of (FRÄNKEL), A., ii, 1000.
- Ethyl- Δ^1 -cyclohexene and its nitrosochloride and nitropiperidine (WALBRACH and MENDELSSOHN-BARTHOLODY), A., i, 404.
- Ethyl- Δ^1 -cyclohexen-3-one and its oxime and semicarbazone, and 4-carboxylic acid, ethyl ester, and its semicarbazone (BLAISE and MAIRE), A., i, 391.
- Ethylhomopapaverinium derivatives (DECKER and DUNANT), A., i, 206.
- Ethylhydantoic acid (BAILEY and KANDOLPH), A., i, 741.
- Ethylhydrouracil (TAFEL and THOMPSON), A., i, 58.
- Ethyl hydroxytert.-butyl ketone and its acetyl derivative (BLAISE and HERMAN), A., i, 248.
- Ethylidenacetacetic acid, ethyl ester, semicarbazide-semicarbazone of (RUPE and HINTERLACH), A., i, 13.
- Ethylideneacetone, action of organomagnesium haloids on (GRY), A., i, 307.
- Ethylidenacetonesemicarbazide-semicarbazone (RUPE and HINTERLACH), A., i, 13.
- Ethylidene-*o*-aminobenzoic acid, trichloro-. See Chloralanthranilic acid.
- Ethylidenedi-*p*-bromoaniline, trichloro-, and its bromo- and chloro-derivatives (WHEELER and MILLER), A., i, 332.
- Ethylidenedi-*o*- and -*p*-methoxyphenylamines, trichloro-, and their bromo-compounds (WHEELER and DICKSON), A., i, 333.
- Ethylidenedi-*o*-tolylamine, trichloro-, and its bromo-derivative (WHEELER and JORDAN), A., i, 333.
- Ethylidenediurethane, tribromo- (DIELS and OCHS), A., i, 10.
- Ethylidene-cyclohexane. See cycloHexene, ethylidene.
- Ethylidenelactic acid. See Lactic acid.
- Ethylidenephosphamic acid, chlorobromo-compounds, derivatives of (SANTALUS, CHAMBERLAIN, and KIMMER), A., i, 369.
- Ethylidenephosphoric carboxylic acid, cyanide, ethyl ester, hydrochloride of (KIMMER), A., i, 368.
- Ethyliminodiacetic acid and its reactions (HASENGER), A., i, 154.
- Ethyl ketones, β -chloro-, reactions of (MAIRE), A., i, 247; (BLAISE and MAIRE), A., i, 390.
- action of nitrogen-containing reagents on the carbonyl group of (MAIRE), A., i, 290.
- Ethylmalonylureide, ethyl ester (BOERINGER & SÖHNE), A., i, 464.
- α -Ethylmeconine, amino-, and its additive salts, bromo-, and nitro- (MCMOD and SIMONIS), A., i, 343.
- Ethynaphthalenes, α - and β -, preparation of (DARZENS and ROSI), A., i, 411.
- 1-Ethylpipcotinic acid (1-ethylpiperidine-3-carboxylic acid (WOHL and LOSANITSCH), A., i, 50.
- N*-Ethylorpapaverinium derivative (DECKER and DUNANT), A., i, 205.
- 3-Ethylisoxazoline and its platinum derivative (MAIRE), A., i, 290.
- 1-Ethyl- β -pipercoline, α -amino-, (3-aminomethyl-1-ethylpiperidine) and its additive salts (WOHL and LOSANITSCH), A., i, 50.
- 1-Ethyl-2- and -3-pipercolines and their resolution (SCHOLTZ), A., i, 679.
- 1-Ethylpiperidine-3-carboxylic acid. See 1-Ethylpipcotinic acid.
- Ethyl β -piperidinoethyl ketone and its oxime, semicarbazone, picrate, and platinumchloride (BLAISE and MAIRE), A., i, 398.
- Ethylisopropylacetacetic acid, ethyl ester (CLARKE), A., i, 493.
- Ethylisopropylacetone. See γ -isopropyl- β -pentanone.
- Ethyl-*n*-propylamine and its additive salts and nitroso-derivative (COMANUCCI and ARENA), A., i, 139.
- Ethyl β -propylaminoethyl ketone and its phenylcarbamide (BLAISE and MAIRE), A., i, 398.
- Ethylpropylsuccinic acids, *s*- and *as*- (FICHTER and KAPPELER), A., i, 660.
- Ethylisopropylsuccinic acids, isomeric, and their calcium salts (FICHTER and GLASER), A., i, 660.
- 3-Ethylpyrasoline and its picrate and phenylcarbamide (MAIRE), A., i, 290.
- 4-Ethylquinoline and its additive salts (BLAISE and MAIRE), A., i, 566, 567.
- Ethyl-red. See Diethylcyanamine iodide.

- Ethylsulphene- β -phenylpropionic acid (POSSNER and BAUMGARTL), A., i, 31.
- Ethyl- Δ^3 -tetrahydro- β -carbolin-2-one and its additive salts of (WHEELER and LOSANTOFF), A., i, 30.
- Ethyl- Δ^3 -tetrahydro- β -carbolin-2-one- β -oxylie, additive salts of (WHEELER and LOSANTOFF), A., i, 30.
- Ethylcarbamate, β -hydroxy- (FARBWERKE VOEGELMEISTER, LUCIUS, & BRÜNING), A., i, 473.
- Ethylcopryline and its additive salts and bromo- (SCHWABE), A., i, 45.
- Ethylthioberbituric acid (EINHORN), A., i, 315.
- Ethylthio-carbamide, picrate and picronate of (WHEELER and JAMIESON), A., i, 253.
- Ethylthiolbenzoic acid and its ethyl ester, preparation of (FARBWERKE VOEGELMEISTER, LUCIUS, & BRÜNING), A., i, 477.
- Ethylthio-carbamie acid, metallic salts and derivatives of (ANSCHÜTZ), A., i, 326.
- Ethylthiol-4-methylpyrimidine, 6-amino- and 6-chloro- (JOHNS), A., i, 317.
- Ethylthiol-5-methylpyrimidine, 6-thio- and 6-thiocyano- (JOHNSON, STORREY, and MCCOLLUM), A., i, 337.
- Ethylthiol-4-methylpyrimidine-5-acetic acid, 6-amino-, and 6-chloro-, and its amide (JOHNSON and HEYL), A., i, 59.
- Ethylthiol-6-oxo-1-benzylpyrimidine and its 5-methyl derivative (JOHNSON and DERBY), A., i, 1018.
- Ethylthiol-6-oxo-3-benzylpyrimidine and its 5-bromo- and 5-methyl derivatives (JOHNSON and DERBY), A., i, 1018.
- Ethylthiolpyrimidine, 5-bromo-6-thiocyano-, and 6-thiocyano- (JOHNSON, STORREY, and MCCOLLUM), A., i, 337.
- Ethylthiolpyrimidine-5-carboxylamide, 6-amino-, and its dibromide (WHEELER and JOHNS), A., i, 339.
- Ethylthiolpyrimidine-5-carboxylic acid, 6-chloro-, acid chloride, and amide of (WHEELER and JOHNS), A., i, 339.
- Ethylthiol-6-pyrimidone-3-acetic acid and its ethyl ester (WHEELER and LIDDLE), A., i, 698.
- Ethylthiol-6-pyrimidone-4-acetic acid and its ethyl ester (WHEELER and LIDDLE), A., i, 698.
- Ethyl tiglyl ketone and its p -nitrophenylhydrazone and semicarbazone (BLAISE and HERMAN), A., i, 596.
- 5-Ethyltrimethylenecarbamide and its picrate (TARL and JAMIESON), A., i, 253.
- Ethyltripropylarsine, picrate (LINN and WILLIAMS), A., i, 253.
- Ethyl vinyl ketone, reactions of its β -diethylacetal (MAIRE), A., i, 222.
- Ethylxanthophanic acid, p -bromophenylhydrazone of (LIEBERMANN and LINDENBAUM), A., i, 549.
- Etna, fumaeoles of (LACROIX), A., ii, 765.
- lavas of the recent eruption of (LACROIX), A., ii, 766.
- Eucalyptol. See Cineol.
- Eucalyptus, occurrence of calcium oxalate in the barks of the (SMITH), A., ii, 885.
- absence of gum and presence of a new diglucoside in the skins of the (SMITH), A., ii, 886.
- Eucalyptus oils, estimation of cineol in (WIEGAND and LEHMANN), A., ii, 296.
- Engenol, oxidation of, by the oxidizing ferment of mushrooms (COUSIN and HÉRISSEY), A., i, 727.
- Engenol, synthesis of (BÉRAL and TIFFENEAU), A., i, 260.
- oxidation of (COUSIN and HÉRISSEY), A., i, 733.
- Eugenyl o - and m -aminobenzoates and their acetyl derivatives, and o - and m -nitrobenzoates (RIEDEL), A., i, 338.
- Eupatorium Rebaudianum, sweet substance from (RASENACK), A., i, 313.
- Euphorbia, South African, phytochemicals from the latex from (COHEN), A., i, 884.
- ψ -Euphorbic acid, α - and β -Euphorbonic acids, ψ -Euphorborosen, and ψ -Euphorbone (TSCHIRCH and LAUCHTENBERGER), A., i, 196.
- Euphorbone and its benzoyl-, p -nitrobenzoyl-, and bromo-derivatives (EMMERLING), A., i, 438.
- Europium, atomic weight of (JACOBSEN), A., ii, 282.
- Eutectics (ROSENHAIN and TUCKER), A., ii, 1038.
- Evaporation apparatus under reduced pressure (DONATH), A., ii, 1027.
- Evolution in chemistry, principle of (KURILOFF), A., ii, 477.
- Excretion of bromides by the kidney (HALE and FISHMAN), A., ii, 611.
- of cholesterol by the dog (DORR and GARDNER), A., ii, 514.
- of creatine and creatinine in health and disease (VAN HOOGENHUYZ and VERBLOUGH; SHAFER), A., ii, 971.
- of creatine and creatinine in hepatic disease (MELLANBY), A., ii, 54.

- Excretion of conjugated glyconic acid**
in the bile (BIAL), A., ii, 611.
- of hexamethylentetramine in bile and pancreatic juice** (CHOW), A., ii, 410.
- of iodine, comparative investigations on the, after administration of potassium iodide and sodium** (BASCH), A., ii, 521; (ANDERHALDEN and KAUTSCH), A., ii, 611.
- of nitrogen, effect of ether anaesthesia on the** (HAWK), A., ii, 410.
- of nitrogen in dogs, influence of potassium cyanide on the** (WELKER), A., ii, 411.
- of sugar, action of various chemical substances on the** (BAER and BLUM), A., ii, 122.
- of sugar in healthy men** (SCHÖNDORFF), A., ii, 311.
- of sulphurous acid in man after administration of sodium sulphite and sulphurous acid in combination with sodium salt** (FRANZ and SONNTAG), A., ii, 714.
- of urobilin in disease** (SURVEYOR), A., ii, 1057.
- of urochrome in man** (DOMBROWSKI), A., ii, 212.
- Expansion and electrical resistance of metals, relation between the** (BRONIEWSKI), A., ii, 147.
- Explosive, crystallisation.** See Crystallisation.
- Extraction, continuous, with a solvent of inconstant boiling point, simple arrangement for** (WÖRNER), A., ii, 681.
- Extraction apparatus** (KULKA), A., ii, 387.
- new reflux condenser for** (MERKEL), A., ii, 478.
- for liquids by means of ether** (SIRKS), A., i, 533.
- for extracting a solid and simultaneously filtering the solution so obtained** (RECORD), A., ii, 575.
- F.**
- Fatoprotein** (BOTTAZZI and SCALINCI), A., ii, 1054.
- Fat, estimation of fat in, by the Kumagawa-Suto method** (INABA), A., ii, 439.
- estimation of glycine in human** (v. ORFLE), A., ii, 439.
- estimation of indole in** (v. MORACZEWSKI), A., ii, 441; (GORTER and DE GRADT), A., ii, 783.
- estimation of nitrogenous metabolism products in** (STUTZER, MERRIS, and SEIDLER), A., ii, 443.
- Fallow** (KRÜGER and HEINZE), A., ii, 61.
- "Farnale Netto"** (CORIS and CHÉRE), A., ii, 418.
- Farmacia, see Farnale Netto.**
- Fat, production of from proteins** (EVDANOFF), A., ii, 204.
- nature of the, in normal and pathological human livers** (HARTLEY and MAVROGORDATO), A., ii, 210.
- saponification of, by means of hydramine** (MORELLI), A., i, 758.
- influence of the products of reaction on the hydrolysis of, by pancreatic juice** (KALABOUKOFF and TZEIROINE), A., ii, 1050.
- behaviour of, towards calcium carbonate** (KÜNKLE and SCHWEDHELM), A., i, 494.
- catalytic reduction of** (PAAL and ROTR), A., i, 599.
- digestion of** (LEVITES), A., ii, 960.
- absorption of, from intestinal loops in dogs** (PLANT), A., ii, 1050.
- isolation of cholesterol from** (SALKOWSKI), A., i, 980.
- percentage of iron in** (GLIKIN), A., ii, 407.
- rancid, certain volatile and non-volatile compounds formed in** (SCALA), A., i, 387.
- in milk.** See under Milk.
- the ethyl ester value of** (HANUS and STEKL), A., ii, 641.
- determination of the saponification number of** (MASTRAUM), A., ii, 439.
- estimation of** (BOGDANOFF), A., ii, 208.
- flask for the estimation of** (DEBOS), A., ii, 641.
- estimation of, in cocoa** (KREUTZ), A., ii, 641.
- estimation of, in faeces and food-stuffs by the Kumagawa-Suto method** (INABA), A., ii, 439.
- and unsaponifiable matter, estimation of, in tissues** (KUMAGAWA and SUTO), A., ii, 331; (BERTRUP), A., ii, 544.
- estimation of, in milk.** See under Milk.
- See also Ochoco fat.**
- Fehling's solution, reduction of, to metallic copper** (NEOCI), A., ii, 848.
- the keeping power of, and the estimation of reducing sugars with it** (WATTS and TEMPANT), A., ii, 437.
- Felspar, soda, existence of a monoclinic isomorphous with orthoclase** (BARBER and PROST), A., ii, 863.

- Fenchane**, amino-, constitution of (BOUVEAULT and LEVALLOIS), A., i, 194.
Fenchene, synthesis of from norbornene (WALLACH), A., i, 811.
Fenchene, and its bromide (WALLACH and VIVCK), A., i, 811.
Fenchene, constitution of, and its hydrobromide (BOUVEAULT and LEVALLOIS), A., i, 193.
Fenchene sulphuric acid and its silver salt (WALLACH and VIVCK), A., i, 811.
Fenchone, establishment of the constitutional formula of (BOUVEAULT and LEVALLOIS), A., i, 193.
comparison of, with α -methylcamphor (GLOVER), T., 1285; P., 151.
separation of, from camphor (SEMMER), A., i, 37.
Fenchone and its oxime and semicarbazone and bromo-derivative (WALLACH and VIVCK), A., i, 811.
Fenchyl phenylcarbamate (WALLACH and VIVCK), A., i, 811.
fermentation, studies in (SLATOR), T., 217; P., 11.
the phenomena of, from the catalytic point of view (SCHADE), A., i, 136.
part played by Bacteria in the formation of higher alcohols during (FRINGSHEIM), A., ii, 723.
consumption of malic acid in (MESTREZAT), A., ii, 723.
acetic, formation of aldehydes or ketones during (FARNSTEINER), A., i, 313.
alcoholic, the mechanism of (SLATOR), T., 217; P., 11.
proof, by means of the chromogram method, that hydrogenase takes an active part in (GRÜSS), A., i, 491.
constitution of aqueous solutions, and the influence of salts on (VANDEVELDE), A., ii, 216.
role of reductase in (PALLADIN), A., i, 589.
formation of acetaldehyde in (TRILLAT; KAYSER and DEMOLON), A., i, 317.
production of succinic acid during (EHELICH), A., ii, 416.
butyric acid (BUCHNER and MEISENHEIMER), A., ii, 525.
oil-free, occurrence of formaldehyde in (LEBEDEFF), A., i, 747.
acetic acid, action of small quantities of metals on (RICHEY), A., ii, 880.
mentation processes, graphic method of registering (FOA), A., i, 746.
Fermented liquids containing other fixed and volatile acids, method of determining succinic acid in (ROZILSCOOT), A., ii, 923.
ferments. See Enzymes.
Ferric, transitory presence of hydrogen cyanide in (GRESHOFF), A., ii, 723.
Ferrimalonic acid, complex salts of (MATSUI), A., i, 853.
Ferrinitrosulphides (CAMBI), A., ii, 852.
Ferripyrophosphoric acid and its salts (PASCAL), A., ii, 193.
Ferrisilicic acids and their bromo-derivative and their esters (HOPFGARTNER), A., i, 891.
Ferro-alloys, production of (GREENWOOD), T., 1496; P., 189.
estimation of carbon in, by means of an electric furnace (JOHNSON), A., ii, 630.
Ferrochrome with high carbon content, assay of (CAFFIN and DEUNCKMAYER), A., ii, 538.
Ferro-compounds, new method of attacking (NICOLARDOT), A., ii, 1074.
Ferro-magnetic substances, specific heat and molecular magnetic field of (WANG and BECK), A., ii, 659.
Ferronitrosulphides (BELLUCCI and DE CESARIS), A., ii, 499.
probable constitutional formulae of the (BELLUCCI and DE CESARIS), A., ii, 593.
See also Roussin's salts.
Ferropyrophosphates (PASCAL), A., ii, 193.
reducing power of (PASCAL), A., ii, 500.
Ferro-silicon, chemical behaviour of high percentage (HAAS), A., ii, 110.
new method of attacking (NICOLARDOT), A., ii, 1074.
Ferro-vanadium, simultaneous volumetric estimation of iron and vanadium in (WARYNSKI and MDIVANI), A., ii, 736.
Fertilisers. See Manures.
Fever, xanthine as a cause of (MANDEL), A., ii, 54.
Fibrin, influence of the reaction of blood-plasma on the formation of (PATRIN), A., ii, 605.
the swelling of (FISCHER), A., i, 929.
Fichtelite from Borkovia, Bohemia (PLZAK and ROSICKÝ), A., ii, 395.
Filter for filtering solutions of definite concentration at a temperature either above or below that of the surrounding medium (LEVITZ), A., ii, 576.
Filters, relative efficiency of (BULLOCH, CHAW, and ATKIN), A., ii, 314.

- Filters**, grain of, and growth of bacteria through them (CHAY), A., ii, 314.
See also **Ultra-filtration**.
- Filtration**, ultra-filtration (WILSON), A., ii, 314.
- Flac**, muscle, hydrolysis of (OSBORNE and HENRY), A., ii, 1055.
- Flames**, gastric digestion in (VAN HERVEN and ZWEDEN), A., ii, 372.
Tendency of silver salts to (PROGIM), A., ii, 412.
Brain of. See **Brain**.
Mahian, pancreatic diabetes in (DIAMARE), A., ii, 519.
- Flame**, Bunsen. See **Bunsen flame**.
- Flame**, reactions and colorations, simple gas burner contrivance for showing (TROTNER), A., ii, 341.
- Flames** of various kinds, spectroscopic study of (HEMSALECH and DE WATTEVILLE), A., ii, 336.
Coloured, apparatus for producing (GOLDSCHMIDT), A., ii, 787.
- Flavanthrene**, reduction products of (SCHOLL and NEOVIUS), A., i, 740.
products of reduction of, and the relation between their colour and constitution (SCHOLL and HOLDERMANN), A., i, 696.
- Flavanthrine** and its hydrate and **Flavanthrinol** (SCHOLL and HOLDERMANN), A., i, 696.
- Flavanthrinol hydrate** (SCHOLL and NEOVIUS), A., i, 740.
- Flavone** group (TAMBOUR), A., i, 350, 353.
- Flies**, insect in (ROSENBERGER), A., ii, 1055.
- Flour**, wheat, detection of rice starch in (FELTRISOT), A., ii, 236.
- Flowers**, indole in (WEEHUIZEN), A., ii, 1035.
- Fluidity** and viscosity (BINGHAM), A., ii, 1017.
- Fluazone**, quinonoid ester salts of, and **2,4-dichloro** (GREEN and KING), A., ii, 1003.
- Fluorine**, hydrogenation of (SCHMIDT and MEZGER), A., i, 16.
oxidation of (LAW and PERKIN), T., 1697; P., 195.
condensation of, with alkyl nitrites and nitrates by means of potassium ethoxide (WISLICHENUS and WALDMÜLLER), A., i, 373.
sodium derivative of (WEISSENBERR), A., i, 373.
perhydride (SCHMIDT and MEZGER), A., ii, 17; (SPITZER), A., i, 531.
- Fluorene**, 9-amino-, and its reactions (AUSTIN), T., 1786; P., 200.
- Fluorene**, 9-amino-, and its isomeric and their derivatives (SCHMIDT and MEZGER), A., ii, 17.
- Fluorene**, 3-nitro-, and 9-amino-, and their isomeric salts (WISLICHENUS and WALDMÜLLER), A., i, 373.
- Fluorene** salts (DAUBRENET), A., i, 164.
- Fluorene**-1-naphtharidine, preparation of (AUSTIN), T., 1786; P., 200.
- Fluorenone**, 3-nitro-, and its oxime (SCHMIDT and SÖLL), A., i, 397.
- Fluorenone**dicarboxylic acid, esters and ester-salts of (LUX), A., i, 373.
- Fluorenone**oxime (WISLICHENUS and WALDMÜLLER), A., i, 373.
- Fluorescein**, the chromogen of (KEHMANN and DENGLE), A., i, 1002.
- Fluorescence** and chemical constitution (KAUFFMANN), A., ii, 5.
and colour, relation of, to constitution (SILBERRAD and ROY), P., 204.
of organic substances (v. LIEBIG), A., i, 445.
luminescence, and chemical constitution (HANTZSCH), A., ii, 446.
and photo-electric sensitiveness of organic substances (STARK and STEUBING), A., ii, 746.
change of the colour of, with the solvent (LEY and v. ENGELHARDT), A., ii, 746.
ultra-violet, of cyclic compounds (LEY and v. ENGELHARDT), A., ii, 911.
of organic compounds (STARK and STEUBING), A., ii, 911.
of platinocyanides (LEVY), T., 1446; P., 178.
- Fluorescent substances**, action of, on enzymes (JAMADA and JODLAUER; ZELLER and JODLAUER), A., i, 239.
action of, in yeast and yeast press juice (v. TAPPEINER, KURZMANN, and LOCHER), A., i, 239.
- Fluorides**. See under **Fluorine**.
- Fluorine** in wines (CARLES), A., ii, 313.
compounds, detection of, in wines (VANDAM), A., ii, 63, 775.
- Fluorides**, inhibiting action of, on lipase, and test for, in food products (AMBERG and LORENHART), A., i, 235.
- Hydrofluorides** of some organic bases (WEINLAND and REISCHLE), A., i, 974.
- Hydrofluosilicic acid**, estimation of (HÖNIG), A., ii, 65.

- Fluorine, estimation of small amounts of (STEIGER), A., ii, 426.
See also HALL.
- Fluorocarbon, formation of, 364.
- See also under Fluorine Substances.
- Fluorocarbonic acids, *α*-O-Fluorophenylcarbamide, (SCHMIDT and STUTZMANN), A., ii, 416.
- Fogelstein, and its acetate, and argosterin (TANREU), A., i, 637.
- Food, preserved, corrosion of tinned containers by acids and by the contents (LEHMANN), A., ii, 389.

- Formaldehyde-lactose** (ROSENBERG), A., i, 320.
- Formaldehydphenylhydrasone**, dicyano- (STEINKOFF and BOHMANN), A., i, 327.
- Formaldehydesulphoxylic acid**, *See* Rongalitic acid.
- Formaldehydesulphorylic acid**, preparation of (BADISCHE ANTRIT & SODA-FABRIK), A., i, 605.
- sodium salt. *See* Rongalite.
- zinc basic salt, sparingly soluble, preparation of (FARBWERKE F. H. M. MEISTER, LUCIUS, & BEHNIGG), A., i, 133.
- Formaldehydyl disulphoxide** (KLEIN and GAUFF), A., i, 970.
- Formalin**. *See* Formaldehyde.
- Formylacrylic acid** and its salts and ethyl ester (HENRICH and THOMAS), A., i, 114.
- Formic acid**, quantity of, in honey (FARNSTEINER), A., ii, 539.
- preparation of concentrated (CHEMISCHE FABRIK GRUNAU, LANDHOFF, & MEYER), A., i, 593.
- and acetic acid, rates of distillation of (RICHMOND), A., i, 763.
- fermentation of, by *Proteus vulgaris* (FRANZEN and BRADY), A., ii, 215.
- detection of (FENTON and SHERON), A., i, 243.
- test for, in glacial acetic acid (GORD and KLEIN), A., ii, 940.
- detection of, in food (WERNER and BREWER), A., ii, 303.

fungi, formation of fusel oil by certain (PRINGSHEIM), A., ii, 316.
de-amidising enzymes (PRINGSHEIM), A., ii, 373.
higher, *Phoma* (ZELLEMEIER), A., ii, 218.
funnel, dust (STOLTZENBERG), A., ii, 1071.
turbine, for mixing solutions (GAWA LOWSKI), A., ii, 939.
furan, hydrogenation of (BOURGUIGNON), A., i, 280.
urfuraldehyde, diacetate from (LAW), A., i, 321.
urfuroylacetic acid (*pyromucylacetic acid*), ethyl ester, reactions of (TORREY and ZANETTI), A., i, 840.
urfurylidenopyruvic acid, iodo-lactone from (BOUGAULT), A., i, 539.
urnace gases, apparatus for the automatic analysis of (KEANE and BURROWS), A., ii, 735.
uroin, alkylation of (IRVINE and McNICOLL), T., 1608; P., 192.
uroxan, constitution of (WIELAND and SEMPER), A., i, 108.
uroxandicarboxylic acid, ethyl ester, and its reactions (WIELAND and GRELIN), A., i, 1013.
Furyl-5-pyrazolone and its picrate, acetyl, benzylidene, and phenyl-carbamide derivatives (TORREY and ZANETTI), A., i, 840.
fusel oil, formation of, by certain fungi (PRINGSHEIM), A., ii, 316.
formation, the depression of (PRINGSHEIM), A., ii, 723.
fusion surfaces. See Freezing point surfaces.

G.

abbronitic rocks from Neurode, Silesia, analyses of (TANNHÄUSER), A., ii, 1047.
adolinium fluoride (POPOVICI), A., ii, 283.
sulphide (ERDMANN and WIRTH), A., ii, 695.
alactose, behaviour of, towards dilute sodium hydroxide (MEISENHEIMER), A., i, 319.
alactose-*o*- and -*m*-nitrophenylhydratone (REICHAUTE), A., i, 1014.
denical preparations made from leaves and from other parts of plants, reaction distinguishing between (RICHARD and BIDOT), A., ii, 444.
llic acid, electrolytic oxidation of (A. G. and F. M. PERKIN), T., 1186; P., 149.
action of reducing agents on (GARDNER and HODGSON), P., 272.

Gallocarboxylic acid mono- and trimethyl ethers (FRIEST), A., i, 102.
Gallocyanine, preparation of a derivative of (FARMENTARIER), G. and F. BAYER & CO., A., i, 1001.
Gallocyanin dyes, condensation of, with amino-compounds (GRANDMOUGIN and BODMER), A., i, 572.
Gallotannic acid, constitution of (ELLOYD), A., i, 347.
p-Galloxybenzoic acid (FISCHER), A., i, 893.
Gas, modified form of Saint-Clair Deville's apparatus for the continuous production of (GRIGNARD), A., ii, 857.
generated from aluminium electrodes (v. HIRSCH and SODDY), A., ii, 12; (v. HIRSCH), A., ii, 925.
measurement of a homogeneous chemical change in a (CLARK and CHAPMAN), T., 1638; P., 190.
high pressure, simple regulator for (LE ROSSIGNOL), A., ii, 827.
illuminating, estimation of benzene in (DENNIS and MCCARTHY), A., ii, 435.
coal. See Coal gas.
Gas analysis (ANEMA and VAN DERVENTER), A., ii, 221; (WUITE), A., ii, 891.
problems of (ANEMA and VAN DERVENTER), A., ii, 221; (DE VOLDERE and DE SMET), A., ii, 426.
apparatus, new (ROSS and LEATHER), A., ii, 626.
accurate form of, for commercial and other purposes (BONE and WHEELER), A., ii, 221.
Hempel's, improvements in (DE VOLDERE), A., ii, 61.
technical, estimation of hydrogen in (HAUSER), A., ii, 425.
Gas burettes. See Burettes.
Gas burner contrivance, simple, for showing flame reactions, combustion phenomena, and flame colorations (THÖRNER), A., ii, 341.
Gas current pressure regulator (JOHNSON and BUCH), A., ii, 270.
Gas generating apparatus, Erper's (GUTMANN), A., ii, 826.
for analytical purposes (MÜLLER), A., ii, 129.
Gas laws, simple demonstrations of the (DEHN), A., ii, 355.
Gas-pipette, compound (FLEISSNER), A., ii, 891.
Gas thermometer. See under Thermochemistry.
Gas volumes, new instrument for reducing, to standard conditions (DAVIS), A., ii, 866.

- Gaseous mixtures**, influence of the silent discharge on explosive (FASBENDER), A., ii, 561.
 conductivity of, at the moment of explosion (DE MUYNCK), A., ii, 345.
 detection of ozone, nitrogen peroxide, and hydrogen peroxide in (KEISER and McMASTER), A., ii, 222.
 estimation of arsenic hydride in (RECKLEBEN and LOCKEMANN), A., ii, 224.
- Gaseous reactions** which are photochemically sensitised (WEIGERT), A., ii, 5.
- Gaseous substances**, velocity of absorption of, by solid substances (HANTZSCH and WIEGNER), A., ii, 158.
- Gases** subjected to the action of spark discharge or arc light, certain phenomena in (v. TRAUBENBERG), A., ii, 1012.
 extraction of, contained in metals (BOUDOTARD), A., ii, 109.
 dielectric constants of, at high pressures (TANGL), A., ii, 558.
 inflammation of, at the end of a metallic rod (MEUNIER), A., ii, 276.
 combustion of, by incandescence in presence of oxidisable and of non-combustible substances (MEUNIER), A., ii, 376.
 action of alkali salts of a fixed base on the combustion of (DARTIGHE), A., ii, 275.
 which are in a state of motion, reaction velocity in (BODENSTEIN and WOLGAST), A., ii, 162; (LANGMUIR), A., ii, 1020.
 arrangement for liquefying and distilling easily condensable (v. BARTAL), A., ii, 929.
 use of sodium as a desiccating agent for (MATHONEN), A., ii, 377.
 in liquids, cryoscopic investigations on solutions of (FALLOLA), A., ii, 1015.
 condensation nuclei produced by cooling, to low temperatures (OWEN and HUGHES), A., ii, 565.
 absorption of, by rubber tubing (DITMAR), A., ii, 159.
 influence of colloids on the absorption of (FINDLAY and HARRY), A., ii, 1024.
 occluded in steels (BELLOC), A., ii, 108.
 occluded in a special nickel steel (BELLOC), A., ii, 852.
 inactive, percentage of, in the atmosphere; a correction (RAMSAY), A., ii, 688.
 iodized (BLANC), A., ii, 754.
- Gases**, high percentage, analysis of (FRANZEN), A., ii, 425.
 monatomic, electric discharge in (SODDY and MACKENZIE), A., ii, 151.
 poisonous, absorption of, by the respiratory tract (LEHMANN, WIENER, WILKE, and YAMADA), A., ii, 171.
 rare, presence of, in the atmosphere at different heights (TEISSERENCLE BORT), A., ii, 763.
 of thermal waters (MAURER and BIQUARD), A., ii, 277.
 produced in the alimentary canal of goats (BOYCOTT and DAMANT), A., ii, 122.
- Gastric digestion**. See Digestion.
 juice in children, chemical composition of (SOMMERFELD), A., ii, 403.
 action of alkalis on the proferment of (TICHOMIROFF), A., ii, 404.
 the Leo process for the estimation of acidity of the monometallic phosphates in (BARBERIC), A., ii, 532.
- secretion, influence of bromine on (TOGAMI), A., ii, 872.
 action of therapeutic agents on the (FEIGL), A., ii, 311.
- Gedrite** from Canada (EVANS and BANCROFT), A., ii, 604.
- Gelatin**, physical modifications of, in presence of electrolytes and nonelectrolytes (LARGUER DES BANCHELS), A., i, 233.
 tanning of (ABEGG and v. SCHROEDER), A., i, 233.
 phenomena of the "precipitation" and "insolubilisation" of (A. and L. LUMIERE and SEYFERTZ), A., i, 710.
- Gelatins**, estimation of sulphurous acid in (PADEL), A., ii, 893.
- Gelatin jellies**, diffusion of albumin into (MÖLLHAUSEN), A., ii, 679.
- Gelatin solutions**, behaviour of, towards naphthols or mixtures of naphthols with formaldehyde (WEINSCHEID), A., i, 377.
- Gelatinisation**, the process of (LEVINE), A., ii, 161, 264, 476.
- Gelatose** as colloid producer (LIEFENGANG), A., ii, 476.
- Gelatoses** SKRAUP and HUMMELBERGER), A., i, 711.
- cycloGeranic acids** and their amides and their conversion into citrals (MERLING), A., i, 653.
- Geranic series**, mechanism of the ring formations in the (TILFENAU), A., i, 509.

- eranyl benzoate and methyl ether (BACON), A., i, 815.
- ermanium silver sulphide. See Argyrodite.
- land, digestive, of the crawfish (BRADLEY), A., ii, 405.
- lymph, spleen, and thymus, occurrence of choline in (SCHWARZ and LEDERER), A., ii, 968.
- thymus, nucleic acid of. See Nucleic acids.
- thymamine from the (NELSON), A., i, 1030.
- thyroid, relationship of the, to the physiological action of adrenaline (PICK and PINELES), A., ii, 875.
- choline, the depressor substance in the (v. FÜRTH and SCHWARZ), A., ii, 968.
- hands, physiology of the (HAAS), A., ii, 874.
- See also Suprarenal.
- Hass, violet coloration produced in, by the influence of light (MASCHHAUPT), A., ii, 1003.
- deposition of copper mirrors on (NEOGI), A., ii, 848.
- colourless, some effects of sunlight on (GORTNER), A., ii, 183.
- dark-coloured, production of a (SACKUR), A., ii, 1036.
- silicate, action of phosphoric acid on (HITTNER), A., ii, 838.
- Hass thermostats. See under Thermochemistry.
- Haucohydroellagic acid (NIERENSTEIN), A., i, 548.
- Haucophyllins (WILLSTÄTTER and PFANNENSTIEL), A., i, 198.
- hadin from rye, hydrolysis of (OSBORNE and CLAPP), A., i, 115.
- estimation of (MATHEWSON), A., ii, 448.
- polyscopic method for the estimation of (SHAW), A., ii, 240.
- Hobularia *Allypum*, rutin from (WUNDERLICH), A., i, 559.
- Hobalin from the almond, hydrolysis of the (OSBORNE and CLAPP), A., i, 115.
- from the egg-yolk of *Squalus acanthias* (ALSBERG and CLARK), A., ii, 963.
- antitoxic (BANZHAF; BANZHAF and GIBSON), A., ii, 412.
- Hobulin ions, measurement of the molecular mass of (SUTHERLAND), A., i, 930.
- How. See under Electrochemistry.
- Hucinum salts, structure of (GLASMANX and NOVIKOV), A., i, 120; (TANATAR and KUROYSKI), A., i, 166, 502, 758.
- Glucinum salts, influence of, on plants (KANOMATA), A., ii, 616.
- Glucinum basic sulphates, soluble (PARSONS, ROBINSON, and FULLER), A., ii, 105.
- d*-Gluconic acid, alkaloidal salts (NEF), A., i, 6.
- Glucosamine, behaviour of, and of the first product of its transformation in the animal body (STOLTE), A., ii, 50.
- d*-Glucose. See Dextrose.
- Glucoseanilide, preparation, alkylation, and mutarotation of (IRVINE and GILMOUR), T., 1434; P., 186.
- Glucosehydrazone, constitution of (IRVINE and GILMOUR), T., 1429; P., 186.
- Glucoseoxime, preparation and alkylation of (IRVINE and GILMOUR), T., 1435; P., 186.
- Glucosides, synthesis of (RYAN and ERRILL), A., i, 716.
- Baptisia (GORTER), A., i, 97.
- cyanogenetic, in feeding-stuffs (HENRY and AULD), A., ii, 619.
- of Linaria (KLOBE), A., i, 903.
- and sugars, application of bio-chemical methods for the detection of, in Taxee (LEFEBVRE), A., ii, 57.

- Glutaric acid**, methyl ester, action of magnesium phenyl bromide on (FUCHT), A., ii, 916.
- Gluten**, a modification of the properties of, by sulphurous acid (DUGAST), A., i, 709.
- Glycerides**, theory of the hydrolysis of the (WEGSCHEIDER), A., i, 499; ii, 165.
saponification of, during ester exchanges in homogeneous systems (KREMMANN), A., i, 120; ii, 1021; (STRITAR and FANTO), A., ii, 677, 1021.
diacyl preparation of (ULZER, BATHK, and SOMMER), A., i, 310.
- Glycerol**, $C_3H_8O_3$, from salmaglycerol (WALLACH), A., i, 132.
- Glycerol**, density, refractive index, surface tension, and viscosity of various mixtures of water and, at 18° (MARTINEZ-STROGO), A., i, 347.
and water, explanation of the viscosity curve for mixtures of (CARICANTO), A., ii, 758.
colour of (SPRING), A., i, 118.
esterification of phosphoric acid by (PRUNTEE), A., i, 2.
compounds of, with metallic salts (GRÜN and BOCKISCH), A., i, 931.
ethers with phenols, new method of formation of (SCHNYKOVICH), A., i, 978.
- Glyceryl monomethyl ether α -methylol** (GRÜN and BOCKISCH), A., i, 935.
diphenyl ether (BOYD and MARLE, T., 849; P., 92.
disterophosphate and its di-*amino*-derivative (ULZER and BATHK, A., i, 589.
di-*p*-tolyl ether (BOYD and MARLE, T., 839; P., 92.
esters of saturated monobasic fatty acids, action of concentrated sulphuric acid on (THIEME), A., i, 498.
 α - and β -naphthyl, phenyl, and *o*, *m*, and *p*-tolyl ethers (SCHNYKOVICH), A., i, 978.
nitrates and their acetates and benzoates (WILL, HAANES, and STÖHRER), A., i, 384.
- Glycide**, nitro- (WILL, HAANES, and STÖHRER), A., i, 384.
- Glycidic acids**, $\beta\beta$ -disubstituted, preparation of (DARZENS), A., i, 81.
- Glycine (aminoacetic acid)**, condensation of, with aminopropiondicarboxylic acid (GODDARD, T., 1172; P., 116.
relation of, to uric acid (SARLEY, A., i, 226.
as a product of uricolysis (STOKES), A., i, 373.
albumoses, and peptones, isolation of, from dilute aqueous solutions (SIMPSON-FRIED), A., i, 234.
in normal blood (BINGEL), A., ii, 1048.
of normal urine (EMERSON and MAX, A., ii, 518.
derivatives (HINSBERG), A., i, 433.
synthesis of (ANDERHAUSEN and HIRSZOWSKI), A., i, 387.
copper sulphates, complex, physico-chemical study of the (BARKER), A., i, 323.
and benzoic acid, detection of, in urine (SEO), A., ii, 518.
estimation of, in human feces (v. ORFFLE), A., ii, 439.
- Glycine**, ethyl ester, reduction of (FISCHER), A., i, 323.
- Glycines**, aromatic, preparation of (IMBERT & CONSORTIUM FER ELECTROCHEMISCHE INDUSTRIE), A., i, 875.
- Glycine anhydride** and its methyl homologues, nitration and acetylation of (FRANCHIMONT and FRIEDMANN), A., i, 509.
Glycine hispida. See Soja bean.
- Glycine-N-thiocarboxylic acid**. See Carbaminoacetic acid, dithio.
- Glycocholic acid** (PILLET), A., i, 959.
sodium salt, preparation of (LEWIS), A., i, 326.
- Glycochryson** (HESSE), A., ii, 419.
- Glycogen**, formation of, by yeast (PAY and BYWATERS), A., ii, 56.
can the liver form, from optically active amino-acids? (GRUBB), A., ii, 516.
the smallest molecule from which the liver can make (GRUBB), A., ii, 307.
transformation of, by enzyme action in embryonic tissues (MEXEL and SAKI), A., ii, 297.
general mechanism of the transformation of, into dextrose in the muscles and tissues (MAISONNE), A., ii, 53.
in frogs during inanition (PELFOER), A., ii, 52.

- Glycogen**, of frog's spawn (HAENSEL), A., ii, 769.
 in mouse tumours (HAALAND); A., ii, 612.
 precipitation of (PELÜGER), A., ii, 329.
 constitution of, by inversion with acids (GREEK), A., ii, 829.
- Glycol**. See Ethylene glycol.
- Glycol-chlorohydrin ethers**, alkylene, and their changes (HOUBEN and FÖHRER), A., i, 73; (HOERING), A., i, 119, 497; (HOUBEN), A., i, 307, 993.
- Glycollic acid**, preparation of, by the electrolytic reduction of oxalic acid (DEUTSCHE GOLD- & SILBER-SCHMID-ANSTALT), A., i, 600.
 esterification of (HOLMBERG), A., i, 387.
 phenylhydrazine salt (NEF), A., i, 5.
- Glycollic acid**, glucinum salt (GLAS-MANN and NOVICKY), A., i, 121.
- Glycollic acid**, thio-, antimony salt (ROSENHEIM), A., i, 246.
 ditlio-, preparation of (KALLE & Co.), A., i, 605.
- Glycollic acids**, thio-, antimony and tin compounds of (HOLMBERG), A., i, 130.
- Glycols**, aromatic, mechanism of the transposition of phenyl in (TIFFENEAU), A., i, 166.
- α-Glycols**, compounds of, with metallic salts (GRÜN and BOCKISCH), A., i, 934.
- Glycolysis** (McGEEGAN), A., ii, 496.
- Glycosuria**. See Diabetes.
- Glycuronic acid**, the asymmetric conjugation of (MAYER), A., i, 393.
 conjugated, elimination of, in the bile (BIAL), A., ii, 611.
 and its derivatives, detection of, in presence of pentoses and in urine (B. TOLLENS), A., ii, 639; (K. TOLLENS), A., ii, 740.
 detection of, by B. Tollens' method, in human urine (TOLLENS), A., ii, 710.
 estimation and colour reactions of (LEFÈVRE and TOLLENS), A., ii, 74.
- Glycyl-*D*-alanine**, methyl ester, and its hydrochloride (FISCHER), A., i, 887.
- Glycyl-*D*-alanylglycyl-*L*-tyrosine** (FISCHER), A., i, 325.
- Glycyl-*D*-alanyl-*L*-tyrosine** (ABDER-HALDEN and HIRSZOWSKI), A., i, 888.
- Glyclaminoacetal** and its derivatives (FISCHER), A., i, 544.
- Glycyl- α -aminostearic acid** and its sodium salt and anhydride (FISCHER and KNOFF), A., i, 773.
- Glycyltyrosylglycine** (FISCHER), A., i, 544.
- Glycyltyrosylglycyl-*D*-alanine** (FISCHER), A., i, 887.
- Glycyl-*D*-valine** and its derivatives (FISCHER and SCHEIBLER), A., i, 957.
- Glycyrrhetic acid** and **Glycyrrhizic acid** (TSCHIRCH and GAUCHMANN), A., i, 898.
- Glyoxal** (*oxalic aldehyde*) sodium hydrogen sulphite, reaction of, with aromatic amines (HINSBERG), A., i, 453.
- Glyoxalones** (*iminacolones*) (BILTZ and HORMANN), A., i, 56.
- Glyoxime peroxides**, constitution of (WIELAND and SEMPER), A., i, 108.
- Glyoxylase** (GRANSTRÖM), A., i, 235.
- Glyoxylic acid**, action of, on aniline and its homologues (v. OSTROMISSENSKY), A., i, 889.
 fermentative change of, in organs (GRANSTRÖM), A., i, 235.
 occurrence and detection of, in human urine (GRANSTRÖM), A., ii, 122.
- Glyoxylic acid**, ethyl ester, alcoholate of (TRAUBE), A., i, 76.
- Glyoxyl-nitrophenylacetic acid** (KUNCKELL and FLOS), A., i, 890.
- Goats**, alimentary canal of. See Alimentary canal.
- Gold**, fulminating, preparation of (JACOBSEN), A., ii, 601.
 direct action of radium on (PERMAN), T., 1775; P., 214.
 action of barium and sodium peroxides on (MEYER), A., ii, 47.
 metallic, solution of, in hydrochloric acid in presence of various organic substances (AVERKIEFF), A., ii, 559.
 solutions, colloidal, optical properties of (STREIBING), A., ii, 600.
- Gold chloride**, reduction of, by charcoal (AVERY), A., ii, 391.
 solutions, action of sugars on (VANINO), A., ii, 504.
 and phosphorus chloride, complex, derivatives of (LEVI-MALVANO), A., i, 774.
 chromates (ORLOFF), A., ii, 48.
- Chlorauric acid**, action of silver nitrate on (JACOBSEN), A., ii, 601.
- Gold sulphites**, complex (ROSENHEIM, HERTZMANN, and PRITZE), A., ii, 860.
- Gold organic compounds** with phosphorus (LEVI-MALVANO), A., i, 775.
- Gold**, detection of, by the metaphosphate bead (DONAU), A., ii, 434.

- Gold**, estimation of, by means of sucrose or dextrose (LEIDLER), A., ii, 827.
- Gold assaying**, apparatus for the prevention of acid fumes in (DARD), A., ii, 72.
- Gold ions**, equilibrium in (BOSSE), A., ii, 264.
- Gout** (KIONKA), A., ii, 972.
- Gramineæ**, hydrolytic enzyme in the resting seeds of some (TANAKA), A., i, 489.
- Grapes**, transformations of the chromogenic matter of, during maturation (LABORDE), A., ii, 1064.
- red**, origin of the colouring matter of (LABORDE), A., ii, 774; (MALVEZIN), A., ii, 887.
- Graphite**, density of (LE CHATELIER and WOLOGBINE), A., ii, 177.
- solubility of**, in iron (CHAPPE), A., ii, 110; (BENEDICKS), A., ii, 275.
- estimation of** (BROWNE), A., ii, 896.
- estimation of ash in** (SADLER), A., ii, 225.
- colloidal** (ACHESON), A., ii, 375.
- Green manure**. See under Manure.
- Grignard's reaction**, applications of (BRITISH ASSOCIATION REPORTS), A., i, 305.
- See also Magnesium organic compounds.
- Grindelia**, examination of (POWER and TUTIN), A., ii, 526.
- Growth**, contributions to the chemistry of (LOCHHEAD and CRAMER), A., ii, 710.
- chemical studies on** (MENDEL and SAIKI; MENDEL and LEAVEN-WORTH), A., ii, 207.
- Guaiacol**, preparation of vanillin from (ROESLER), A., i, 248.
- azo-derivatives of** (COLOMBANO and LEONARDI), A., i, 65.
- ethylene and trimethylene ethers** (GATTIERMANN), A., i, 35.
- Guaiacol**, *o*- and *p*-bromo-, 6-bromo-4-nitro-, and its potassium salts, and 4-bromo-6-nitro-, potassium salts of (ROBERTSON), T., 791; P., 73.
- 5-cyano-** (*isovanillic acid*) (MAMELI), A., i, 18.
- iodo-**, constitution of (TASSILLY and LEROIDE), A., i, 161.
- p*-iodo-** (MAMELI and PINNA), A., i, 263.
- 1- and 5-iodo-** (MAMELI), A., i, 13.
- Guaicol-sulphonic acids**, *o*- and *p*-, separation of (CHEMISCHE FABRIK VON HEYDEN), A., i, 161.
- Guaicum reaction**, the mechanism of the (CARLSON), A., ii, 644.
- Guaicum resin oil** (HARNACK), A., i, 686.
- Guaicylphosphoric acid** and its salts and chloride (AUGER and DUPUIS), A., i, 529.
- Guanazole**, 4-amino- (*guanazole*), and its additive salts and triazole derivative, and compound with benzaldehyde (PELLIZZARI and REPETTO), A., i, 65.
- Guanidine**, salts of, with acid dyes (RADLBERGER), A., i, 1601.
- aluminium sulphate**, double (FERRE-BOSCHI), A., i, 720.
- 4-nitroacetylthranilate** (BOWEN and KLABER), A., i, 467.
- Guanidine**, cyano-. See Dicyanamide.
- Guanidines**, picrolonates of (WHEELER and JAMIESON), A., i, 259.
- α Guanidinehexoic acid**, ω -amino-, synthesis of, and its nitrates (HENSEL), A., i, 862.
- Guanine**, formation of purp. from nucleic acids (LEVENE and MANDEL), A., i, 586.
- Guanylie acid** (HANG), A., i, 70; (LEVENE and MANDEL), A., i, 587.
- from the pancreas** (STUDLEY), A., i, 70; (V. FÜRTH and JERUSALEM), A., ii, 119.
- of the spleen** (JONES and ROOSTREE), A., i, 487.
- Guignet's green**, colour and composition of (WOHLER and BECKER), A., ii, 765.
- Guldberg-Avogadro law** (KURATOFF), A., ii, 812.
- L* Glucose**, preparation of (BLANKSMA and ALBERA VAN EKENSTEIN), A., i, 951.
- iron transformation of**, into *D*-sucrose (ALBERA VAN EKENSTEIN and BLANKSMA), A., i, 136.
- Gum** of the almond tree (HUEBEE), A., i, 606.
- Gypsum**, solubility of, in copper sulphate solutions (BELL and TIERE), A., ii, 107.
- as a mudure** (TAKEUCHI), A., ii, 624.
- See also Calcium sulphate.

H.

- Hæm-agglutination and lacerolysis** (LIEBERMANN), A., ii, 865.
- and its physical basis** (HIRSCHFELD), A., ii, 402.
- Hæmatein** and its derivatives (ESCHS-PERKIN, and ROBINSON), T., 1115; P., 148.

- Hæmatein**, methylation of (ENGELS, PERKIN, and ROBINSON), T., 1140.
- Hæmatic acids**, salts, esters, and aniline derivatives of, and condensation products of the esters (KÜSTER, LACOUR, and NICOLE), A., i, 303.
- Hæmatin** (KÜSTER, LACOUR, and NICOLE), A., i, 303; (KÜSTER and FUCHS), A., i, 585.
- Hæmatite crystals**, artificial (MUNROE), A., ii, 116.
- Hæmatoxylin** and brazilin and their derivatives (ENGELS, PERKIN, and ROBINSON), T., 1115; P., 148.
- constitution of (PERKIN and ROBINSON), T., 489; P., 54.
- as an indicator in the titration of phosphoric acid (LYONS), A., ii, 532.
- Hæmin** (v. SIEWERT), A., i, 486.
- and bromo- and iodo- (MERUHOWICZ and ZALESKI), A., i, 231.
- iodo-, Dennstedt's method for the analysis of (ZALESKI), A., ii, 132.
- Hæmoglobin** and the leuco-base of malachite-green, reaction between (BUCKMASTER), A., ii, 643.
- influence of, on phagocytosis (HAMBURGER and HEKMA), A., ii, 511.
- alleged formation of bile acids and bile pigments by the action of trypsin on (HOLLIS), A., ii, 408.
- the aloin test for (DOLLAND), A., ii, 240.
- action of reducing agents on compounds of (BEINKER), A., i, 709.
- derivatives, Dennstedt's method for the analysis of (ZALESKI), A., ii, 132.
- See also Carboxyhæmoglobin, Carboxymethæmoglobin, Oxyhæmoglobin, and Photomethæmoglobin.
- Hæmolysins**, distribution of the salts in (WOELFEL), A., ii, 402.
- the chemical (VANDEVELDE), A., ii, 49, 512.
- complex (TSURASAKI), A., ii, 708.
- Hæmolysis** (ARRHENIUS), A., ii, 708; (v. LIEBERMANN), A., ii, 959.
- and hæm-agglutination (v. LIEBERMANN), A., ii, 865.
- lipolysis, and agglutination (NEUBERG), A., ii, 708.
- the mechanism of, by saponin (MEYER), A., ii, 709.
- time relations of, on exposure to light of sensitised red blood corpuscles (HARZBECKER and JODLBAUER), A., ii, 866.
- influence of certain proteins and other colloids on (MEYER), A., ii, 513.
- and cobra poisoning (BANG), A., ii, 721.
- Hæmolysis** by snake poison (v. DUNCERN and COCA), A., ii, 866.
- by soaps (FRIEDEMANN and SACHS; SACHS), A., ii, 866.
- Hæmolytic action** of mercury salts (DUNN-BORKOWSKI), A., ii, 1049.
- Hæmolytic poisons**, especially bile salts and soaps (NEUFELD and HANDEL), A., ii, 959.
- Hæmopyrrole** (MARCHLEWSKI and RETTINGER), A., i, 710.
- action of diazobenzene chloride on (MARCHLEWSKI), A., i, 843.
- Hair**, chemical composition of (RUTHERFORD and HAWK), A., ii, 53.
- Hallerite** from Mesvres (BARBIER), A., ii, 604.
- Halloysite**, ratio of alumina and silica in (STREMMER), A., ii, 1041.
- Halochromism** of quinones (MEYER), A., i, 731; (KEHRMANN), A., i, 993.
- Halogen carriers**, new theory of (BANCROFT), A., ii, 788.
- use of pyridine bases as (CROSS and COHEN), P., 15.
- Halogen compounds**, organic, interaction of, with aluminium, indium, and thallium (SPENCER and WALLACE), T., 1827; P., 194.
- the chemical dynamics of the reactions between sodium thiosulphate and (SLATOR and TWISS), P., 286.
- Halogen salts**. See Perhalogen salts.
- Halogens**, activity of, in relation to mercury (SCHUYTEN), A., ii, 31.*
- activity of, in relation to the metals in general (SCHUYTEN), A., ii, 31, 683.
- Pringsheim's method for estimating, in organic compounds (VIRGIN), A., ii, 1070.
- estimation of, in organic chloro-bromo-compounds (BAUBIGNY), A., ii, 530.
- See also Bromine, Chlorine, Fluorine, and Iodine.
- Hardness**, chemical composition, crystalline form, and density, relation between (PÖSCHL), A., ii, 673.
- of solid solutions of metals and of definite chemical compounds (KERNAKOFF and SCHEMITSCHUSCHUY), A., ii, 932.
- Haricots**, Hungarian, supposed toxicity of (GUIGNARD), A., ii, 53.
- Hauerite**, action of potassium chlorate on (SPEZIA), A., ii, 861.
- Hay**, digestibility of, from water meadows as compared with ordinary hay (FRIEDLAENDER), A., ii, 1066.
- nutritive value of non-proteins in (KELLNER), A., ii, 220; (MÜLLER), A., ii, 726.

- Heart**, apparatus for the perfusion of the isolated mammalian (BRODIE and COLLIS), A., ii, 865.
 vagus inhibition and the output of potassium from the (HOWELL and DUKE), A., ii, 209.
 action of barium chloride and sodium sulphate on the (SCAFFIDI), A., ii, 520.
 action of cesium on the normal and fatty (SCAFFIDI), A., ii, 411.
 action of digitalin on the (HÜLSCHINSKY), A., ii, 520.
 action of digitalis and strophanthus on the (TIGERSTEDT), A., ii, 612.
 action of digitalis on the vagus (LHOTÁK v. LHOŤA), A., ii, 521.
 influence of certain poisons in the fibrillary contraction of the (WINTERBERG), A., ii, 521.
 influence of salts and non-electrolytes on the (BENEDICT), A., ii, 608.
 action of strychnine on the nerve fibres of the vagus of the (FORLT), A., ii, 721.
 and vessels, the sensory nerves of the, as a factor in determining the action of drugs (JACKSON and MATTHEWS), A., ii, 813.
 frog's, action of certain metallic ions on the (GAUTRELET), A., ii, 120.
 of *Limulus*. See *Limulus*.
 of mammals, action of lactic acid on the isolated and surviving (BACKMAN), A., ii, 612.
 See also Circulation.
- Heart rate**, carbon dioxide in the regulation of the (HENDERSON), A., ii, 219.
- Heat**. See under Thermochemistry.
- Heat stroke** and high temperature (SCUTTON), A., ii, 972.
- Heerabolene** and its dihydrochloride, α - and β -Heerabolene and their diacetyl derivatives, α -Heerabolene and its salts, and Heerabolene (v. FRIEDRICH), A., i, 37.
- Hefner lamp**, radiation of the (LEDER), A., ii, 5.
- Helianthin**, action of dilute nitric acid on (FOX), A., i, 581; (HEWITT), A., i, 582.
 isomerism of (HANTZSCH and HILSCHER), A., i, 169.
- Helical structures** (GAUBERT), A., ii, 175.
- Helium**, accumulation of, in geological time (STRUTT), A., ii, 922.
 xenon, krypton and neon, percentage of, in the atmosphere (RAMSAY), A., ii, 988.
 and radioactivity in rare and common minerals (STRUTT), A., ii, 649.
- Helium** in saline minerals, and its probable connexion with potassium (STRUTT), A., ii, 923.
 and thorium, association of, in minerals (STRUTT), A., ii, 144.
 in minerals containing uranium (DODDAS), A., ii, 505.
 rate of production of, from radium (DEWAR), A., ii, 921.
 rate of production of, from thorium and uranium (SODDY), A., ii, 921.
 refractive power of (SCHEEL and SCHMIDT), A., ii, 333.
 refraction and dispersion of (HELMANN), A., ii, 333, 785.
 dispersion of (CUTTERLISON and NATHALFE), A., ii, 545.
 refractive index and dispersion of light in (BURTON), A., ii, 545.
 lines, Zeeman effect for the (LOHMANN), A., ii, 152, 243.
 argon, and air, magnetic behaviour of, in relation to oxygen (TASZLER), A., ii, 152.
 determination of the dielectric constant of (HOCHHEIM), A., ii, 654.
 and argon, thermal conductivity of mixtures of (WACHSMUTH), A., ii, 351.
 condensation of, by expansion (ONNES), A., ii, 490.
 a new determination of c_p/c_v for (BEHN and GERBER), A., ii, 59.
 liquefaction of (ONNES), A., ii, 544.
 genesis of ions by collision of positive and negative ions in (JULL and PIDDUCK), A., ii, 798.
 detection of small quantities of, in minerals (BORDAS), A., ii, 150.
- Helium atom**, number of quasi-classical bound electrons in the (EUFLE), A., ii, 557.
- Hemichlorogenic acid** and its pentacetyl derivative and their aniline salts (GOTTER), A., i, 346.
- Hemipinic acid**, nitro-, esterification of (WESSCHER v. KUSOV and v. DUREVA), A., i, 763.
 methyl esters, isomerism of (WESSCHER and STRAUCH), A., i, 794.
- Hemp**, effect of new nitrogenous fertilizers on (STOHR), A., ii, 421.
 Canadian. See *Apocynum androsaemifolium*.
- Hempel's apparatus**, modification of (HAUSER), A., ii, 125.
- Δ^8 Heptadiene** (KEIF), A., i, 547.
- Heptaldoxime** (*centaheptaldoxime*), alkylation of (IRVINE and MOORE), T. 192.

- 4:5:6:2:3:4'-Heptamethoxydiphenyl-2:6'-dicarboxylic acid and its methyl ester (HERZIG, TSCHERNE, and V. BRUNNECK), A., i, 548.
- heptane. See $\beta\beta$ -Dimethylpentane- $\alpha\gamma$ -diol.
- α' -Heptane and its reduction (WILLSTÄTTER and KAMETAKA), A., i, 531.

- cyclo***Hexene** ozonides, α - and β -, decomposition of (HARRIES and V. STAUDENMANN), A., i, 968.
- Δ^1 -*cyclo*Hexeneacetic acid** and its nitrile (HARDING, HAWORTH, and PERKIN, T., 1959).
- Δ^1 -*cyclo*Hexeneacetic acid**, α -cyano-, and its ethyl ester (HARDING, HAWORTH, and PERKIN, T., 1959).
- cyclo***Hexene- α -butyric acid** and its ethyl ester and silver salt (WALLACH, CHURCHILL, and REINSCHLEER), A., i, 404.
- cyclo***Hexene- β -butyric acid** (WALLACH and MALLISON), A., i, 406.
- cyclo***Hexene-ethane** and its nitroschloride, nitrolpiperidide, and methoxyloxime (WALLACH and EVANS), A., i, 403.
- cyclo***Hexene- α -propionic acid** and its ethyl ester (WALLACH and EVANS), A., i, 403.
- and its silver salt and nitrile, and α -cyano-, methyl ester of (HARDING, HAWORTH, and PERKIN, T., 1961).
- Hexene series**, studies in the (ZELINSKY and PRISCHWALSKY), A., i, 845.
- Δ^4 -Hexen- δ -ol** and its acetate and chloride (REIF), A., i, 847; BIEHL, A., ii, 1092.
- Δ^1 -*cyclo*Hexen-1-ol**, esters of (MANNICH and HANCO), A., i, 276.
- Δ^2 -*cyclo*Hexenone** and its semicarbazone (KÖTZ and GÖTZ), A., i, 174.
- Hexenyl alcohols**. See Dimethylallylcarbinol, Δ^2 -Hexen- δ -ol, and γ -Methyl $\Delta\gamma$ penten- δ -ol.
- cyclo***Hexenyl methyl ketone** and its oxime and semicarbazone (WALLACH and EVANS), A., i, 403.

- o*-**Hexenyl methyl ketone** and its semicarbazones (WALLACH, CHURCHILL, and RENTSCHLER), A., i, 405.
- o*-**Hexenylsalicylic acid** (MEERWEIN), A., i, 90.
- Hexinoic acid.** See Sorbic acid.
- Hexoic acid, α -amino.** See Leucine.
- β -hydro- γ -hydroxy,** lactone of (BOUGAULT), A., i, 537.
- Hexic acids, *l*- and *d*-** (NEUBERG and REWALD), A., i, 310.
- See also **α -Dimethylbutyric acid, α -Ethylbutyric acid, and α -Methylvaleric acid.**
- Hexophenone, ϵ -amino,** and its additive salts (GABRIEL and COLMAN), A., i, 619.
- Hexoylamino.** See under the parent substance.
- Hexoyl-*l*-histidine,** α -bromo-, and its methyl ester (FISCHER and CONE), A., i, 1005.
- Hexoyl- α -methylisoserines,** α -bromo-, *l*- and *D*-compounds of (KAY), A., i, 774.
- Hexoyl-*l*-proline,** α -bromo-, and α -hydroxy-, amide and lactone of (FISCHER and REIF), A., i, 1008.
- Hexoyl-*l*-tyrosine,** α -bromo- (ABERHALDEN and HIRSZOWSKI), A., i, 888.
- Hexoyl-*d*-valine, d - α -bromo-** (FISCHER and SCHEIBLER), A., i, 953.
- Hexyl alcohol,** active, rotatory power of (CHARDIN), A., ii, 913.
- Hexyl bromide,** active, rotatory power of (CHARDIN), A., ii, 913.
- Hexyl ether** (PATIEFF and PHILIPPOFF), A., i, 342.
- Hexylacetic acid, β -bromo-** (HARDING, HAWORTH, and PERKIN), T., 1960.
- Hexyl-2-acetic acid, 2-bromo-1-hydroxy,** lactone of (HARDING, HAWORTH, and PERKIN), T., 1963.
- Hexylene,** active (α -phenyl- γ -methylpentone), rotatory power of (CHARDIN), A., ii, 913.
- Hexylcarbinol** and its acetate and iodide (FAWORSKY and BERGMANN), A., i, 15.
- Hexyl-*p*-dimethylaminophenylcarbinol** (SCHMIDLIN and v. ESCHER), A., i, 164.
- Hexyldiphenylcarbinol** (SCHMIDLIN and v. ESCHER), A., i, 163.
- Hexylene** (ZELINSKY and PRISCHEVALSKY), A., i, 845.
- xylene.** See also **β -Methyl- $\Delta^{\alpha\beta}$ -xylene.**
- xylene ozonide** (HARRIES and HAEFFNER), A., i, 846.
- B*-cycloHexylethylamine,** preparation of, and behaviour of, towards nitrous acid (WALLACH), A., i, 426.
- cycloHexylglycollic acid** (ZELINSKY and SCHWEDOFF), A., i, 864.
- cycloHexyldienacetic acid** (HARDING, HAWORTH, and PERKIN), T., 1961.
- cycloHexyl methyl ketone** and its *p*-nitrophenylhydrazones (WALLACH and EVANS), A., i, 404.
- 3-cycloHexylisooxazalone** (WAHL and MEYER), A., i, 891.
- cycloHexylpropionic acid** and its amide (ZELINSKY), A., i, 864.
- Hippocoprosterol** (DORÉ and GARDNER), A., ii, 514.
- Hippomelanin** (RONA and RIESSER), A., i, 1023.
- Hippuric acid,** limits of the formation of, in man (LEWINSKI), A., ii, 518.
- produced in animals, parent substance of the (VASILIU), A., ii, 211.
- scission of, by bacteria (SEO), A., ii, 518.
- test for, in urine (DEHN), A., ii, 907.
- separation of, from urine (ROAF), A., i, 534.
- Hippuric acid, *p*-hydroxy-** (FISCHER), A., i, 892.
- Hippuronitrile, 4-nitro-2-amino, 2-N-acetyl derivative of** (BOGERT and KLABER), A., i, 463.
- Hirudin,** effect of, on blood-gases (BARCROFT and MINES), A., ii, 117.
- Histidine,** arginine, and lysine, amount of, in the hydrolytic products of various animal tissues (WAKEMAN), A., ii, 209.
- colour reaction of (KNOOP), A., ii, 642.
- derivatives (FISCHER and CONE), A., i, 1004.
- Hofmann's reaction** with amides and hydrazine derivatives of carbonic acid (DARAFSKY), A., i, 106.
- Holmium** and erbium, separation of (HOFMANN and BURGER), A., ii, 189.
- α -Homobetaine.** See Trimethyl- α -propionobetaine.
- Homo-olestranol** (POWER and TUTIN), T., 896; P., 117.
- Homophthalic acid, esters** (DIECKMANN and MEISER), A., i, 894.
- Homopiperonal** and its oxime, semicarbazone, nitrile, and amine (SEMMLER and BARTELT), A., i, 901.
- Homopiperonyl alcohol** (SEMMLER and BARTELT), A., i, 902.
- Homopiperonylic acid** and its methyl ester (SEMMLER and BARTELT), A., i, 901.
- Homotanacetonedicarboxylic acids** (SEMMLER), A., i, 92.

- Homothujyl alcohol** (WALLACH), A., i, 431.
- Honey**, quantity of formic acid in (FARNSTEINER), A., ii, 639.
detection of formic acid in (MERL), A., ii, 991.
- Hopeltes**, α - and β -, from Rhodesia (SPENCER), A., ii, 397.
- Hordein**, hydrolysis of (KLEINSCHMITT), A., i, 69.
- Hordenine**, reactions of, based on its constitution (DENIGES), A., i, 735.
- Horse**, liver of the. See Liver.
- Horse-serum**, proteins of (MELLANBY), A., ii, 117.
- Hortonolite** from Iron Mine Hill, Rhode Island (JOHNSON and WARREN), A., ii, 203.
- Huantajayite**, synthesis of (CORNU), A., ii, 396.
- Kulsite** from the Seward Peninsula (KNOFF and SCHALLER), A., ii, 507.
- Humic acid** (SÜCHTING), A., ii, 231; (VAN SCHEERBECK), A., ii, 743, 994; (TACKE and SÜCHTING), A., ii, 994.
- Humus**, separation of clay in the estimation of (MOOERS and HAMPTON), A., ii, 744.
formation (SUZUKI), A., ii, 127, 421.
substances soluble in water from Scandinavian fresh waters (ASCHAN), A., i, 250.
- Humusoles** (ASCHAN), A., i, 250.
- Hydantoic acid** (*carbamidoacetic acid*) and its salts (LITICH), A., i, 861.
- Hydantoin** (HARRIES), A., i, 573.
- Hydantoin**, cyclic, $C_5H_7O_2N_2$, from the phenylcarbamido-derivative of 4-amino-1-methylcyclohexane-4-carboxylic acid (SKITA and LEVI), A., i, 885.
- Hydantoin-1-acetamide**, 4-imino- (JONGKEES), A., i, 960.
- Hydantoin-1-acetic acid** and its esters and amide (JONGKEES), A., i, 960.
- Hydantoins**, thio-, and bases from them (BAILEY and RANDOLPH), A., i, 742.
desulphurisation of (BAILEY and RANDOLPH), A., i, 741.
- Hydantointetrazones** (BAILEY and BROOKS), A., i, 812.
- Hydra fusca**, nucleoli of (WALKER and EMBLETON), A., ii, 868.
- Hydramides**, action of magnesium organic compounds on (BUSCH and LEEFHEIM), A., i, 151.
- Hydrate theory** (JONES and PEARCE), A., ii, 19; (JONES and STINE), A., ii, 474.
- Hydrate theory**, the effect of one salt on the hydrating power of another salt present in the same solution (JONES and STINE), A., ii, 474.
- Hydrates**, formed by a number of electrolytes, approximate composition of the (JONES and PEARCE), A., ii, 19.
of fatty acids, according to measurements of the viscosity of their solutions (TSAKALOTOS), A., i, 488, 598.
- Hydration values**, determination of (ARMSWONG and CROTHERS), A., i, 816.
- Hydratopyltropeine**, bromo-, hydrobromide of, and chloro-, and its hydrochloride, picrate and platinumchloride (WOLFENSTEIN and MANLOCK), A., i, 281.
- Hydrazine**, preparation of (RASMUSSEN), A., ii, 1029.
action of cyanogen bromide on (PERCZAKI and KEPETTO), A., i, 65.
oxidation of (BROWNE and SHETZLEY), A., ii, 373.
action of nitrous esters on, in alkaline solution (STOLLE), A., i, 947, 948, 949.
(THIELE), A., i, 927; ii, 919.
influence of, on the intermediary metabolism of the dog (ENDERBILTZ and KLEINER), A., ii, 214.
and nitroso-, colloidal nitrites of (H. MANN and BOCHNER), A., i, 576.
hydrate, action of, on diazoacetamide and on ethyl diazoacetate (CRATIUS, DARVINSKY, and BOCKMANN), A., i, 144.
action of, on nitro-compounds (CRATIUS and MAYER), A., i, 53.
- Hydrazines**, secondary, action of, on carbamide (MILKATH), A., i, 52, 1014.
- arosec.* **Hydrazines**, reactions of (FRANZ and SCHEUEMANN), A., i, 293.
- Hydrazines**, aromatic, oxidation of by metallic oxides, permanganate- and chlorates (CHATTAWAY), T., 279; P., 10.
conversion of, into diazomethane (CHATTAWAY), T., 852; P., 74.
- Hydrazino-groups**, replacement of hydrazyl groups by (FRANZ and EICKLER), A., i, 831.
- 2-Hydrazino-1:3:4-triazole**, 1-amino-3-thio- (STOLLE and BOWLES), A., i, 475.
- Hydrazo-compounds**, electrolytic preparation of (DAEMSTADTER), A., i, 301.
- 5-Hydrazodiethylphthalide** (BATES), A., i, 274.
- Hydrazoic acid**. See Azide.

- ydrazotartaric acid, methyl ester, preparation of (CURTISS and TARNOWSKI), A., i, 760.
 ydrazotoluene, transformation of, into tolidine (VAN LOON), A., i, 831.
 ydrazo-. See also Hydrazino-
 ydrindene derivatives, formation of, from *o*-phenylenediacetonitrile (MOORE and THORPE), T., 165; P., 12.
 ydrindene, β -imino- α -cyano-, and its phenylhydrazine derivative (MOORE and THORPE), T., 176; P., 12.
 ydrindone, preparation of (MOORE and THORPE), T., 186; P., 13.
 action of bromine on (CREETH and THORPE), T., 1507; P., 192.
 ydrindone, α -cyano-, and its phenylhydrazone, metallic salts, and *o*-benzoyl derivative (MOORE and THORPE), T., 178; P., 13.
 formation of (CREETH and THORPE), T., 1509.
 ydriodic acid. See under Iodine.
 ydroanthracenes and their derivatives (GUCHOT), A., i, 16.
 ydroaromatic acids, conversion of, into their aldehydes (MERLING), A., i, 653.
 ydroaromatic aldehydes, formation of, from their acids (MERLING), A., i, 653.
 ydroaromatic compounds, study of (BRITISH ASSOCIATION REPORTS), A., i, 328.
 transitions of, to aromatic compounds (KÖTZ and GÖTZ), A., i, 173.
 ydrobilirubin, extra-intestinal origin of (AUSTIN and ORDWAY), A., ii, 408.
 ydrobromic acid. See under Bromine.
 ydrocarbon, C_8H_{10} , and its derivatives, from cyclobutylidimethylcarbinol (KJNER), A., i, 530, 865.
 $C_{10}H_{16}$, from Philippine terpenes (BACON), A., i, 815.
 $C_{13}H_{24}$ (two), from caryophyllene (DEUSSEN and LEWINSOHN), A., i, 354.
 $C_{16}H_{30}$, from the action of sodium alkyl on ethylbenzene (SCHORIGIN), A., i, 886.
 $C_{17}H_{30}$, from the action of magnesium methyl iodide on ethyl 1-methyl- Δ^2 -cyclopentene-2-carboxylate (HAWORTH and PERKIN), T., 597.
 $C_{17}H_{30}$, from methyl α -phenylcinnamylideneacetate and magnesium methyl iodide (REIMER and REYNOLDS), A., i, 989.
 $C_{25}H_{50}$, from magnesium *p*-tritoly-methyl chloride and benzaldehyde (SCHMIDLIN and HODGSON), A., i, 240.
 Hydrocarbon equilibria, calculation of (V. WARTENBERG), A., ii, 26, 676.
 Hydrocarbons, formation of, by the interaction of metals of the aluminium group with organic haloids (SPENCER and WALLACE), T., 1827; P., 194.
 formation of, by the interaction of alkyl haloids with magnesium (SPENCER and CREWDSON), T., 1821; P., 194.
 lecture experiments on the preparation of (SPENCER), A., i, 620.
 two, in the unsaponifiable portion of chrysalidene oil (MENOZZI and MORESCHI), A., i, 241.
 thermal behaviour of (REDCROVE), A., ii, 758.
 thermal decomposition of (BONE and COWARD), T., 1197; P., 167.
 dissociation of several, in the eudiometer for measuring fire-damp (GREHANT), A., i, 493.
 equilibrium of the hydrogenation of (PADOA and FABRIS), A., i, 255, 776.
 oxidation of, by air in presence of phosphorus (COLSON), A., i, 435.
 contact oxidation of (ORLOFF), A., i, 520.
 action of sulphur on (CAPELLE), A., i, 201; (OEHSNER DE CONINCK), A., i, 750.
 aromatic, relation between the absorption spectra and chemical constitution of (BALY and TUCK), T., 1902; P., 223.
 of the benzene series, oxidation of (LAW and PERKIN), T., 1633; P., 195.
 cyclic, with semicyclic linkings, preparation of (WALLACH, CHURCHILL, EVANS, MALLISON, MENDELSSOHN-BARTHOBY, and RENTSCHLER), A., i, 402.
 ethylenic, preparation of (BOUVEAULT), A., i, 117.
 with conjugate ethylene linkings, spectroscopic behaviour of (BRÜHL), A., ii, 1002.
 hexacyclic, isomeric (WALLACH), A., i, 425.
 open-chain, halogen derivatives, crystal form of, with reference to the Barlow-Pope theory of structure (JAEGER), T., 517; P., 29.
 quinonoid, preparation of (STAUDINGER), A., i, 410, 411; (TSCHITSCHIBABIN), A., i, 872.
 of the quinodimethane series, preparation of (TSCHITSCHIBABIN), A., i, 872.
 saturated, action of nitric acid on (NAMETKIN), A., i, 329.

- Hydrocarbons**, saturated, containing two isopropyl groups, nitration of (KONVALOFF), A., i, 241.
 doubly unsaturated, addition of the higher oxides to (WIELAND and STENZL), A., i, 517.
- Hydrocarbons**, dinitro-, halogen derivatives of (PONZIO and CHARRIER), A., i, 521.
 primary dinitro-, action of diazo-salts on (PONZIO), A., i, 482; (PONZIO and CHARRIER), A., i, 582.
 See also Olefines, Paraffins, Terpenes, and Sesquiterpenes.
- Hydrocellulose**, cellulose, and oxycellulose, highly nitrated (BERL and KLAFF), A., i, 504.
- Hydrocelluloses** (SCHWALBE), A., i, 9.
- Hydrochalcone**, 2':4'-dihydroxy-. See Phenyl phenylethyl ketone, *o*-dihydroxy-.
- Hydrochloric acid**. See under Chlorine.
- Hydrocinamic acid**. See β -Phenyl-propionic acid.
- Hydrocoumarone** and coumarone derivatives from 1:7-dimethylcoumarin (FRIES and FICKENWIRTH), A., i, 824.
- Hydrocyanic acid**. See under Cyanogen.
- Hydrodi- β -naphthaphenazine**, *tetra*nitrato- (LEEMANN and GRANDMOUGIN), A., i, 480.
- Hydrodiphenazine**, *tri*chloro- and *tetra*nitrato- (LEEMANN and GRANDMOUGIN), A., i, 479.
- Hydroditolphenazines**, *tri*-, *di*-, and *p*-*tetra*nitrato- (LEEMANN and GRANDMOUGIN), A., i, 479.
- Hydroergotinine**. See Ergotoxine.
- Hydrofluorides**. See under Fluorine.
- Hydrofluosilicic acid**. See under Fluorine.
- Hydrogel** and hydrosol, process of formation of (LOTTERMOSER and ROTHER), A., ii, 364.
- Hydrogen**, atomic weight of (NOYES), A., ii, 100, 367.
 and chlorine, relative atomic weights of (GRAY and BERT), P., 215.
 new method of preparing pure (MAVRICHEAU-BEAUFREY), A., ii, 829.
 purification of, from arsenic (RECKLEBEN and LOCKEMANN), A., ii, 271.
 change in the spectrum of, under the prolonged action of strong electric discharges (ROGOVSKY), A., ii, 335.
 distribution of intensity in the spectra of the canal rays in (STARK and STEUBING), A., ii, 516.
 electrochemical equivalent of (LEHFELDT), A., ii, 559.
- Hydrogen**, ionic conductivity of (GORE), A., ii, 150.
 passage of, through a partition septum, and the pressure it produces (TSAKALOTOS), P., 208.
 direct union of, with carbon (BAY and COWARD), T., 1975; P., 222.
 slow combination of chlorine with, under the influence of heat (SIX), A., ii, 172.
 and nitrogen, chemical action of radium emanation on (CAMERON and RAMSAY), T., 984; P., 132.
 and oxygen, chemical action of radium emanation on (CAMERON and RAMSAY), T., 971; P., 132.
- Hydrogen antimonide**. See Antimony trihydride.
- arsenide. See Arsenic trihydride.
 bromide. See under Bromine.
 chloride. See under Chlorine.
 cyanide. See under Cyanogen.
 iodide. See under Iodine.
 nitride. See Azonitride.
- per*-oxide, preparation of (DARVES and SHERRER), A., ii, 845, 829; (FISCHER and RINGE), A., ii, 550; (KAHLBAUM), A., ii, 829.
 formation of, by the silent electric discharge (LOB), A., ii, 489.
 production of, from persulphuric acid (CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE), A., ii, 1028.
- ozone, and nitrogen peroxide, formation of, in reactions in which develop high temperatures (KELSER and McMASTER), A., ii, 223.
- photographic action of (SALLAND), A., ii, 789.
- photographic capacity and supposed radioactivity of (O. and A. DOST HENAU), A., ii, 617.
- catalysis of, by iodine and telluric (ABEL), A., ii, 939.
- kinetics and catalysis of the reaction between a thiosulphate and H_2 (A.), ii, 26.
- pulsating catalysis of, by mercaptan (V. ANTONOFF), A., ii, 172.
- catalytic decomposition of, by means of an electric current (BREDIG and WILKE), A., ii, 679.
- catalytic decomposition of, under high pressures of oxygen (SHEAR), A., ii, 370.
- action of alternating currents of high frequency on the decomposition of, by colloidal platinum (LEBEDEFF), A., ii, 166.

- hydrogen peroxide, decomposition of, by means of platinum foil compared with catalysis by colloidal platinum (TELETOFF), A., ii, 95.
- decomposition of, in presence of various substances (FILIPPI), A., ii, 271.
- interaction of, with sulphides (GAZDAR and SMILES), T., 1833; P., 216.
- double compounds of, with organic compounds (TANATAR), A., i, 399.
- mercury salts of (V. ANTROPOFF), A., ii, 383.
- test for, in presence of aldehydes (MOLINARI and FENAROLI), A., i, 849.
- ozone, and nitrogen peroxide, detection of, in gaseous mixtures (KEISER and McMASTER), A., ii, 222.
- detection of, in milk (FEDER), A., ii, 318; (WILKINSON and PETERS), A., ii, 907, 1069.
- phosphide, action of, on mercuric bromide or chloride (LEMOULT), A., ii, 35.
- sulphide, heat of vaporisation of (ELLIOTT and McINTOSH), A., ii, 351.
- absolute density of (BAUME and PERRON), A., ii, 910.
- action of, on alkaline solutions of zinc salts (McCAY), A., ii, 431.
- replacement of, in chemical analysis (DONATH), A., ii, 730.
- lowest oxides of (FROMM, ROESICKE, and GAUFF), A., i, 969.
- disulphide (BLOCH and HÖHN), A., ii, 579.
- constitution of (BLOCH), A., ii, 580.
- trisulphide (BLOCH and HÖHN), A., ii, 579; (SCHENCK and FALCKE), A., ii, 762.
- constitution of (BLOCH), A., ii, 580.
- persulphide, action of, on organic compounds (BRUNNER and VUILLEUMIER), A., i, 900.
- persulphides (STRECKER), A., i, 386; (BRUNI and BORGIO), A., ii, 102; (BLOCH and HÖHN), A., ii, 579; (BLOCH), A., ii, 580.
- Hydrogen**, estimation of, in technical gas analysis (HAUSER), A., ii, 425.
- active, estimation of, in organic compounds (ZEREWITNOFF), A., i, 593.
- and carbon, the Carrasco-Plancher method of estimating, in organic substances (LENZ), A., ii, 65.
- Hydrogenase**, proof, by means of the chromogram method, that, takes an active part in alcoholic fermentation (GRÜSS), A., i, 491.
- Hydrogenation**, equilibrium of (PADOA and FARRIS), A., i, 255, 776.
- Hydrogen electrode**. See Electrode under Electrochemistry.
- Hydrogen ion** derived from transference experiments with nitric acid, equivalent conductivity of the (NOYES and KATO), A., ii, 346.
- Hydrogen ions**, examination of the conception of, in catalysis, salt formation, and electrolytic conduction (LAPWORTH), T., 2187; P., 275.
- estimation of the concentration of, by indicators (MICHAELIS and RONX), A., ii, 571.
- "**Hydrogen number**," the, as a means of determining unsaturated organic compounds in a manner similar to the iodine numbers of Hübl and Wys (FOKIN), A., ii, 637.
- Hydrolation**, hydration, and hydrolysis as determinants of the properties of aqueous solutions (ARMSTRONG), A., ii, 814.
- Hydrology**, isolation of traces of mineral substances from saline mixtures in (MEILLERE), A., ii, 62.
- Hydrolysis**. See under Affinity, chemical.
- Hydratation**, hydrolation, and hydrolysis as determinants of the properties of aqueous solutions (ARMSTRONG), A., ii, 814.
- Hydropinenealdehyde** and its oxime and semicarbazone (HOUBEN and DOESCHER), A., i, 27.
- Hydropiperic acid**, estimation of, volumetrically (BOUGAULT), A., i, 983.
- Hydropiperoïn** and *iso*Hydropiperoïn, action of thionyl chloride on (BARGER and EWINS), T., 735; P., 60.
- Hydrosol** and hydrogel, process of formation of (LOTTERMOSER and ROTHE), A., ii, 364.
- Hydrosols**, freezing of (BOBERTAG, FEIST, and FISCHER), A., ii, 1024.
- See also Colloidal solutions.
- Hydrothymine**, 5-nitro-4-hydroxy-, α - and β - forms (JOHNSON), A., i, 692, 739.
- Hydouracil**, 5-chloro-5-bromo-4-hydroxy-, 5,5-dichloro-4-hydroxy-, and 5-chloro-5-nitro-4-hydroxy- (JOHNSON), A., i, 739.
- Hydouracil-4-acetic acid**, 5-dibromo-4-hydroxy- (WHEELER and LIDDLE), A., i, 694.
- Hydroxides**. See Metallic hydroxides and Peroxide bases.

- Hydroxy-acid.** $C_{15}H_{16}O_3$, and its salts, from pinene (HENDERSON and HEILBRON), T., 289; P., 81.
 $C_{15}H_{16}O_3$, from turmeric oil (RUFF), A., i, 95.
- Hydroxy-acids**, aromatic, and their esters, rule in benzoylation of (LASSAR-COHN and LÖWENSTEIN), A., i, 984.
 organic, formation of salts and complex salts of (LEY and ERLER), A., i, 177; (OBERMILLER), A., i, 634; (THIEL), A., i, 791.
- a-Hydroxy-acids**, transformation of, into aldehydes (GUERREI), A., i, 123.
- Hydroxyaldehydes**, aromatic, preparation of (DREYFUS), A., i, 654.
- a-Hydroxyaldehydes**, aromatic, preparation of (WEIL), A., i, 800.
- a-Hydroxycarboxylic acids**, action of heat on (LE SCHER), T., 716; P., 70.
- Hydroxy-compounds**, aromatic, action of sulphites on (BECHERER and SETDE), A., i, 455.
 See also under the parent Substance.
- β -Hydroxy- α -dialkyl ketones** (BLAISE and HERMAN), A., i, 318.
- Hydroxy-fatty acids**, ammonium salts, oxidation of, by hydrogen peroxide (DARIN), A., i, 75.
- Hydroxy-ketones**, aromatic, hydrazones of (TERRY and KUTCH), A., i, 460.
- Hydroxylamine** and its salts (EBLER and SCHOTT), A., ii, 1029.
- and its hydrochloride, reaction of with carbonyl compounds (ACREE), A., ii, 169.
 electrolytic reduction of, at copper cathodes (TAFEL and HABIL), A., ii, 174; (TAFEL), A., ii, 582; (ROTHMUND and FLASCHNER), A., ii, 583.
 action of, on ketones of the type, $CH_3CH=CHCOH$ (CHEN and TSEH), A., i, 762.
 action of free, on santonin (FRANCESCONI and CUSMANO), A., i, 272.
 behaviour of, in the organism (CHUSA and LAZZATO), A., ii, 876.
 action of, on fats (MORELLI), A., i, 758.
- Hydroxyl groups**, replacement of, by hydrazido-groups (FRANZEN and EICHLER), A., i, 831.
 phenolic, estimation of (HERZOG and HÄSCHEL), A., ii, 327.
- Hygic acids**, hydroxy-, some of (*hydroxy-N-methylprolactins*) (LEUCHS and FELSEK), A., i, 519.
- Hygroscopy**, importance of, in general analysis (REICHARDT), A., ii, 391.
- Hypenephromas**, malignant, fats and lipids of (WELLS), A., ii, 411.
- Hypnotic action** of the valeric acid group (VAN DER ECKHOFF), A., ii, 52.
- Hypiodous acid**. See under Iodine.
- Hypnitrous acid**. See under Nitrogen.
- Hypophosphoric acid**. See under Phosphorus.
- Hypophosphorous acid**. See under Phosphorus.
- Hyposulphites**. See under Sulphur.
- Hypothermolysin** (OLIVÉ), A., ii, 49.
- Hypovanadic acid**. See under Vanadium.
- Hypoxanthine** and its amide (HAISER and WENZEL), A., i, 562.
- Hyssop oil** (SCHIMMEL & Co.), A., i, 837.

I.

- Ice**, density and latent heat of fusion of, and the molecular depression of the freezing point in aqueous solutions (ROTH), A., ii, 757.
- Idocrase** from Sardinia (PELLOU; RIMATORI), A., ii, 862.
- I-dose**, isolation of (BLANKSMA and ALGERDA VAN EKENSTEIN), A., i, 952.
 transformation of, into Isodose (ALGERDA VAN EKENSTEIN and BLANKSMA), A., i, 136.
- Ignition temperature**. See under Thermochemistry.
- Illicyl alcohol** and α -angitin, identity of (JUNGLEISCH and LEROY), A., i, 1000.
- Illuminating gas**. See under Gas.
- Ilmenorutile** and its relation to staurolite (PRIOR and ZAMBONINI), A., ii, 308.
- Ilvaite** from Shasta Co., California (PRESCOTT), A., ii, 705.
- Imide chlorides**, action of potassium thiocyanate on (JOHNSON and STOREY), A., i, 837.
- Imides** of the aromatic sulphonic acids, preparation of (HAGAN), A., i, 571; (SUZUKI), A., i, 871.
- Iminazole** ring, resolution of, in amarine and aniline (FISHER and PRATSE), A., i, 219.
 series, tautomerism in the (GARNIEL), A., i, 573.
- Iminazoles**, formation of (MELDOLA and HAY), T., 1659; P., 197.
- Iminazolones**. See Glyoxalones.
- β -Iminazolypropionic acid** and α -chloro (WINDAUS and VOCH), A., i, 654.
- Imino-acids**, synthesis of (STADNICKOFF), A., i, 251.
- Imino-compounds**, formation and reactions of (MOORE and THORP), T., 165; P., 12; (BEST and THORP), P., 283.

- Iminodiacetic acid** and its derivatives (JONCKEES), A., i, 959.
- β -naphthalenesulphonyl derivative** and its barium salt (BERGELL and FEIGL), A., i, 396.
- Iminodiacetimidic.** See 2:6-Diketopiperazine.
- Imino-esters**, catalysis of (DERBY), A., i, 419; (STIEGLITZ), A., ii, 167, 168; (McCRACKEN), A., ii, 572; (SCHLESINGER), A., ii, 680.
- Imino-esters**, chloro-, *syn*- and *anti*-stereoisomerism of (STIEGLITZ), A., i, 726.
- \downarrow Iminopyrine** and 4-nitroso- (MICHAELIS, MIELECKE, and LUTZE), A., i, 62.
- Lagerflora Ostruthium***, constituents of the rhizome of (HERZOG), A., ii, 978.
- Inanition**, metabolism of calcium, magnesium, and phosphorus during (WELLMANN), A., ii, 306.
- Indazole** and its silver and mercuric derivatives (JACOBSON and HUBER), A., i, 299.
- derivatives, formation of, from *o*-methylated anilines (JACOBSON and HUBER), A., i, 298.
- Indene**, preparation of pure (BOES), A., i, 410.
- Indene-3-carboxylic acid**, 2-amino-, and its ethyl ester and amide, and their hydrochlorides (MOORE and THORPE), T., 183; P., 13.
- 3-Indenobenzopyranol(1:4)** and 7-hydroxy-, and their salts (PERKIN and ROBINSON), T., 1099.
- Indiarubber.** See Caoutchouc.
- Indican**, detection of, in urine (SALKOWSKI), A., ii, 999.
- Indicator**, metanil yellow as a selective (LINDER), A., ii, 627.
- Indicators**, theory of (ACREE), A., i, 423, 652; (STIEGLITZ), A., i, 652; (ACREE and SLAGLE), A., i, 653.
- establishment of the isomerism theory of, in the case of methyl-orange and helianthin (HANTZSCH and HILSCHER), A., i, 469.
- constitution of, used in acidimetry (HEWITT), A., ii, 269.
- for the titration of cinchona bases (RUFF and SEEGERS), A., ii, 239.
- addition of indigo in titrations with methyl- or ethyl-orange (LUTHER), A., ii, 62.
- Indigofera arrecta* and *I. sumatrana***, analysis of the leaves of (GAUNT, THOMAS, and BLOXAM), A., ii, 76.
- Indigo**, analysis of (GAUNT, THOMAS, and BLOXAM), A., ii, 76.
- Indigoid dyes** (FRIEDLÄNDER), A., i, 371, 673; (BEZDAL and FRIEDLÄNDER), A., i, 673; (FRIEDLÄNDER and SCHULOFF), A., i, 674.
- behaviour of, towards alkalis (FRIEDLÄNDER), A., i, 372.
- Indigo-red series**, thio-, preparation of colouring matters of the (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 987.
- Indigotin**, preparation of (LILIENFELD), A., i, 797.
- stereochemistry of (FALK and NELSON), A., i, 107.
- electrolytic reduction of (CHAUMAT), A., i, 107.
- and *o*-, *m*-, and *p*-dichloro-, colours of, in various solutions (SCHWALBE and JOCHHEIM), A., i, 1019.
- behaviour of, towards alkalis (FRIEDLÄNDER), A., i, 372.
- reaction of, with potassium permanganate (MILLER and SMIRNOFF), A., i, 468.
- some unsymmetrical analogues of (GROF), A., i, 1011.
- estimation of, in indigo-yielding plants (BEROTHEIL and BRIGGS), A., ii, 75.
- Indigotin**, *tri*- and *tetra*-bromo-, preparation of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 468.
- chloro-, and its leuco-compound, preparation of stable (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 695.
- o*-, *m*-, and *p*-chloro-, colours of, in various solutions (SCHWALBE and JOCHHEIM), A., i, 1019.
- chlorobromo-, preparation of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 1019.
- tri*-, *tetra*-, and *hexa*-halogenated derivatives, preparation of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 798.
- Indigotin group** (WIELAND and GEMELIN), A., i, 1013.
- Indigotinsulphonic acids**, halogen (SCHWALBE and JOCHHEIM), A., i, 1019.
- Indium**, interaction of, with organic halogen compounds (SPENCER and WALLACE), T., 1832; P., 194.
- Indium perchlorate**, iodate, selenate, and cesium selenate (MATHERS and SCHLUEDERBERG), A., ii, 386.
- silicetungstates (WYROUBOFF), A., ii, 386.
- Indium**, separation of iron from (MATHERS), A., ii, 434.

- Indole** in flowers (WEEHUIZEN), A., ii, 1065.
 regular occurrence of, in urine (JAFFÉ), A., ii, 1057.
 urinary pigments derived from (BENEDICENTI), A., ii, 1057.
 derivatives (HINSBERG), A., i, 453.
 detection of, in pus (PORCHER), A., ii, 769.
 estimation of, in feces (v. MORACZEWSKI), A., ii, 441; (GORTER and DE GRAAFF), A., ii, 788.
- Indoles** (ANGELI and MORELLI), A., i, 828.
 electrolytic reduction of the (CARRASCÓ), A., i, 912.
 reactions of (ANGELI and MARCHETTI), A., i, 207.
- Indoles, nitroso-**, structure of (ANGELI and MORELLI), A., i, 828.
- Indole-acetic acid** as the chromogen of morosin (HERTER), A., ii, 410.
- Indolinones**, formation of (LIEBER), A., i, 681.
- Indolylacrylic acid**, α -amino-, *N*-benzoyl derivative of, and its reduction (ELLINGER and FLAMAND), A., i, 378.
- Indophenol**, $C_{12}H_9O_2N_2S$, from *p*-toluenesulphonyl- α -naphthylamine and *p*-aminophenol (CHEMISCH-FABRIK GRIENHEIM-ELEKTRO), A., i, 209.
- Indophenol**, sodium salt (CASSELLA & Co.), A., i, 416.
- Indoxazen** (COSDORF), A., i, 151.
- Indoxyl** and its derivatives, preparation of (LILLENFELD), A., i, 797.
 and its homologues and derivatives, preparation of (BADISCHE ANILIN- & SODA-FABRIK: LILLENFELD), A., i, 371.
 urinary, symptomatic significance of (PORCHER), A., ii, 769.
- 1-Indoxylbenzene**, 3- and 4-hydroxy- and 3:4-dihydroxy-, and their sulphonic acids (FRIEDLANDER and SCHULOFF), A., i, 671.
- Indoxylcarboxylic acid**, thio-. See (1)-Thionaphthen-2-carboxylic acid, 3-hydroxy-.
- Indoxylthionaphthenone** (2-thionaphthen-2-indol-indigotin) (FRIEDLANDER), A., i, 372.
- Indoxyl 2- and -3-thionaphthen 3- and -2-ones**, 3- and 2- (BEZDIK and FRIEDLANDER), A., i, 673.
- Inuline**, explanation of the formation of (OSTROGOWICH and SILBERMANN), A., i, 373.
- Inulines from aniline** (BACOVESCU), A., i, 825.
- Infant's urine**. See Urine.
- Inks**, gall-iron (HINRICHS and KEDESZY), A., ii, 544; (KEESY, A., ii, 642.
- Inlet-tube**, steam (SRÖLTZENBERG), A., ii, 825.
- Inorganic chemistry**. See Chemistry.
 colloids. See Colloids.
 hydroxides. See Metallic hydroxides.
 salts. See Salts, inorganic.
- Inosic acid** and carnine (HAUSER and WENZEL), A., i, 561.
 and its hydrolysis (NEUBERG and BRAHN), A., i, 1029.
 hydrolysis of (LEVENE and JACOB), A., i, 931.
- Inosine** and its acetate and silver salt, and its hydrolysis (HAUSER and WENZEL), A., i, 561.
- Inositogen** (ROSENBERGER), A., ii, 873.
- Inositol** (*inosite*), production of, from phytin, by phytase (SAZUKI, YOSHIMURA, and TAKASHI), A., i, 236.
 in animal fluids and tissues (ROSENBERGER), A., ii, 873.
 in flesh (ROSENBERGER), A., ii, 1055.
 condensation product of, with phosphoric acid. See Phytin.
 physiological behaviour of (MAYER), A., ii, 521.
- D-Inositol** and its hepta-acetyl derivative (DE JONG), A., i, 952.
- Inositol**, cyclic, relation of, to the aliphatic sugars (NEUBERG), A., i, 394.
- Inositols** (*inosites*) of mistle-toe (TANNEY), A., ii, 58.
- Insoluble substances**, action of soluble substances on (OECHSNER DE CONING and ARZALLER), A., ii, 843.
- Intestinal juice**, nature of the alkalinity of (POLLACK), A., ii, 50.
 loops in dogs, absorption of fat from (PLANT), A., ii, 1050.
 muscle, the work of the (CONNING), A., ii, 299.
- Intestine**, relationship of concentration to absorption in the (LODGE and POLDOWSKA), A., ii, 1050.
 the relationship between the hourly excretion of nitrogen and respiration from the, and its dependence on work, and diuresis (HAAS), A., ii, 874.
 digestion and absorption of meat in the (LODGE and SELMAN), A., ii, 870.
 occurrence of scatole in the human (HERTER), A., ii, 211.
- Intramolecular** change, new method for studying (PATTERSON and McILLARY), A., ii, 266.

- Intramolecular, rearrangement in** active substances, polarimetric study of (PATTERSON and McMILLAN), T., 1041; P., 135.
 effected by fusion with potassium hydroxide (BLANKSMA; TYMSTRA), A., i, 262.
- Invertase of the date** (VINSON), A., ii, 418, 724.
 from yeast, adsorption affinity of (MICHAELIS), A., i, 235.
- Invert sugar.** See Sugar, invert.
- Iodic acid and Iodates.** See under Iodine.
- Iodide of starch, nature of** (KATAYAMA), A., i, 9; (PADOA), A., i, 249.
- Iodides.** See under Iodine and Polyiodides.
- Iodination, studies in** (KÖRNER and BELASIO), A., i, 778.
- Iodine, new polymorphous form of** (KURATOFF), A., ii, 31.
 electrolytic conductivity of, in nitrobenzene solution (BRUNER), A., ii, 149.
 relation between current and potential difference in solutions of, in potassium iodide (BRUNER), A., ii, 754.
 solubility of, in water (HARTLEY and CAMPBELL), T., 741; P., 58.
 action of, on some elements in vacuum (GUICHARD), A., ii, 31.
 reaction of, with phosphorous acid (STEELE), T., 2203; P., 193.
 liberation of, from hydriodic acid by certain halogenated malonyl derivatives (WHITELEY), P., 288.
 comparative investigations on the elimination of, after administration of potassium iodide and sodium (BASCH), A., ii, 521; (ABDERHALDEN and KAUTZSCH), A., ii, 611.
 and selenium (PELLINI and PEDRINA), A., ii, 833.
 and sulphur, existence of compounds of (SMITH and CARSON), A., ii, 32; (EPHRAIM), A., ii, 581.
- Hydriodic acid (hydrogen iodide),** photochemical oxidation of, by oxygen (PLOTHOFF), A., ii, 790.
 decomposition of, in light (BODENSTEIN), A., ii, 172.
 influence of radium on the decomposition of (CRIGHTON and MACKENZIE), A., ii, 450.
 influence of iron compounds and of peroxydases on the catalysis of, by hydrogen peroxide (WOLFF and DE STOEKLIN), A., i, 746.
- Iodine:—**
Hydriodic acid, liquid, heat of vaporisation of (ELLIOTT and MCINTOSH), A., ii, 354.
Iodides, new type of combination of, with sulphur (AUGER), A., i, 241.
Iodic acid, study of the oxidation phenomena produced by (BAUBIGNY), A., ii, 577.
 and bromic acid, estimation of, by means of thiosulphuric acid (CASOLARI), A., ii, 222.
 periodates, bromates, and chlorates, estimation of, by means of formaldehyde, silver nitrate, and potassium persulphate (BRUNNER and MELLET), A., ii, 222.
Hypiodous acid, action of nascent, on unsaturated acids (BOUGAULT), A., i, 179, 269, 537, 791, 983.
Iodine and chlorine, estimation of, in "erythrosine" (JEAN), A., ii, 129.
 bromine, and chlorine, separation of, by means of hydrogen peroxide in acid solution (JANNASCH), A., ii, 730.
 See also Halogens.
- Iodo-** See also under the parent Substance.
- "Iodoargyrum"** (NARDELLI), A., ii, 715.
- Iodo-fatty acids, higher, preparation of esters of** (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 310.
- Iodoform-sulphur** (AUGER), A., i, 241.
- Iodogorgonic acid.** See Tyrosine, 2:5-diiodo.
- Iodohydrins, aromatic, mechanism of the transposition of phenyl in** (TIFFENEAU), A., i, 165, 166; (TIFFENEAU and DAUDEL), A., i, 972.
- Iodolactones** (BOUGAULT), A., i, 537.
- Ionic concentrations, experiments, and mobility, Ionisation, and Ions.** See under Electrochemistry.
- Ionised gases.** See under Gases.
- Ionium** (MARCKWALD and KRETMAN), A., ii, 144; (BOLTWOOD), A., ii, 455.
- ψ-Ionone hydrate, preparation of** (COULIN), A., i, 1000.
- Ipomea purpurea, chemical examination of** (POWER and ROGERSON), A., ii, 725.
- Ipuranol and its diacetyl derivative from olive bark** (POWER and TUTIN), T., 907; P., 118.
- Ipuranol and its acetyl derivative and Ipurolic acid and its esters and salts** (POWER and ROGERSON), A., ii, 725.
- Iridium, wave-length tables of the arc and spark spectra of** (BRITISH ASSOCIATION REPORTS), A., ii, 334.
- Iridium salts, complex** (GIALDINI), A., i, 3.

- Iridium chlorides**, compounds of, with alkalis (DELEPINE), A., ii, 702; (VÉZES), A., ii, 703.
- oxides** (WÖHLER and WITZMANN), A., ii, 300.
- solid solutions in the dissociation of (WÖHLER and WITZMANN), A., ii, 301.
- Iridium crucibles**, use of, in chemical operations (CROOKES), A., ii, 702.
- Irido-oxalates** (GIALDINI), A., i, 3.
- Iron**, crystallised, from a foundry at Teschen, Austria (CORNT), A., ii, 949.
- electrolytic, preparation of (AMBRÉG), A., ii, 593.
- metallic, constitution of (TILDEN), T., 1362.
- flame spectra of (HEMSALECH and DE WATTEVILLE), A., ii, 336, 445.
- spectrum of, in a hydrogen flame (HEMSALECH and DE WATTEVILLE), A., ii, 547.
- spectrum of, observed in the oxyhydrogen blowpipe flame (HEMSALECH and DE WATTEVILLE), A., ii, 547.
- decarburisation of (WÜST), A., ii, 286.
- passivity of (FREDENHAGEN), A., ii, 679.
- cobalt, and nickel, experiments on the passivity of (BYERS), A., ii, 1026.
- rusting of (TILDEN), T., 1356; P., 169; (FRIEND), A., ii, 698.
- corrosion of, by water and water solutions (HEYNS and BAUER), A., ii, 849.
- rust, composition of (TILDEN), T., 1362; P., 169.
- solubility of graphite in (CHARBY), A., ii, 110; (BENEDICKS), A., ii, 275.
- as oxygen carrier (CERVELLO), A., i, 1027.
- of the liver (SCAFFIDG), A., ii, 210.
- percentage of, in fats, lipoids, and waxes (GLIKIN), A., ii, 407.
- Iron alloys** with aluminium (GWYER), A., ii, 285.
- with carbon (CHARBY), A., ii, 697.
- specific heat of (OBERHOFER and MECHEN), A., ii, 386.
- influence of phosphorus on (WÜST), A., ii, 287.
- with carbon and phosphorus (GOERENS and DOBBELSTEIN), A., ii, 1042.
- with carbon and silicon (GONTERMANN), A., ii, 851.
- with copper (SAHMEN), A., ii, 186.
- with phosphorus (GERCKE), A., ii, 1941.
- Iron alloys** with vanadium (VÖGL and TAMMANN), A., ii, 502.
- See also Ferro-alloys, Ferromanganese, Ferro-silicon, and Ferro-vanadium.
- Iron compounds**, hysteresis of certain (BERNDT), A., ii, 1013.
- colloidal, as peroxydiastases (WOLFF, A., i, 137, 490; ii, 573, 1022; (WOLFF and DE STOFKUS), A., i, 746.
- Iron salts**, reducing and oxidising power of (MÜLLER and KAPPELLE), A., ii, 192.
- complex, in which the iron is masked (PASCAL), A., ii, 103.
- and copper salts in presence of acids and alkalis (FRISCHER), A., ii, 947.
- Iron antimonides** (KURNAKOFF and KOSTANTINOFF), A., ii, 390.
- carbide, formation of (FRING), T., 2105; P., 241.
- carbides (UPTON), A., ii, 1042.
- hydroxide, heterogeneous colloidal (SZILARD), A., ii, 197.
- oxide, spent, estimation of naphthalene in (GAIR), A., ii, 135.
- aluminium phosphates, utilisation of native (SCHROEDER), A., ii, 500.
- barium silicate. See Taramellite.
- sulphates, anhydrous, thermal dissociation of the (KEPPELER and D'AN), A., ii, 289; (L. WÖHLER, PRUDOMANN, and P. WÖHLER), A., 290, 581.
- sulphide (MALFATTI), A., ii, 192.
- and aluminium sulphide, probable existence of a compound of (DITZ), A., ii, 111.
- sulphides, decomposition of, by aluminium (DITZ), A., ii, 111.
- Ferric salts**, complex, relation between magnetic and chemical properties of (PASCAL), A., ii, 756, 927.
- oxidations effected by (BONGIOVANNI), A., i, 770.
- ammonio-salts, new series of, in which the iron is masked (PASCAL), A., ii, 193.
- chloride, structure of (JUREFF), A., ii, 698.
- and ferrous chloride, conductivity of solutions of (JUREFF), A., ii, 698.
- hydrolysis of (MALFATTI and MICHEL), A., ii, 111.
- hydrolysis of, effect of the valency of the negative ions on the (MALFATTI and MICHEL), A., ii, 288.
- influence of neutral salts on the hydrolysis of (MALFATTI and MICHEL), A., ii, 1042.

Iron:—

- Ferric chloride**, conditions of equilibrium in the systems, potassium ferrocyanide, water, and (VOLSCHIN), A., ii, 468.
 reaction between potassium thiocyanate and (BONGIOVANNI), A., i, 770, 859.
 compounds of, with alkaloidal salts (SCHOLTZ), A., i, 202.
 chlorides (CAMERON and ROBINSON), A., ii, 112.
 hydroxide, nature of the pseudo-solutions of (GIOLITTI), A., ii, 950.
 hydroxylamite (EELER and SCHOTT), A., ii, 1031.
 oxide, preparation of pure (BRANDT), A., ii, 899.
 electrolytic inactivity of (PETERS), A., ii, 387.
 dissociation pressures of (WALDEN), A., ii, 852.
 different colours of, an effect of the size of the grains (WÖHLER and CONDREA), A., ii, 287.
 sulphates (CAMERON and ROBINSON), A., ii, 112.
Ferrous salts, effect of ferric salts on the rate of oxidation of, and on the catalytic action of (GREEN), A., ii, 824.
 oxide, estimation of, in rock analyses (MAUZELIUS), A., ii, 538.
 oxide hydrate, natural (HART), A., ii, 861.

Iron organic compounds:—

- Iron organic salts** (ROSENTHALER and SIEBECK), A., i, 246.
Ferrous ferrocyanide, colloidal, oxydasic phenomena produced by (WOLFF), A., i, 490; ii, 1022.
Iron and manganese minerals from the crystalline schists of Brosteni, Roumania (BUTUREANU), A., ii, 955.
Iron ore from Bohemia, a remarkable (BECK and DORING), A., ii, 397.
Iron ores, estimation of arsenic in (GUEDRAS), A., ii, 984.
 separation of alumina and silica in (TIMBY), A., ii, 533.
Cast iron, identity of graphite and "temper" graphitic carbon in (CHARPY), A., ii, 37.
 estimation of phosphorus in (CHESNEAU), A., ii, 427.
Cast-irons containing manganese, constitution of (GUILLET), A., ii, 192.
Pig-iron, estimation of carbon in (ORTHEY), A., ii, 131.
Steel process, Thomas basic (WÜST and LAVAL), A., ii, 851.

Iron:—

- Steel**, loss of carbon during solution of, in potassium cupric chloride (MOORE and BAIN), A., ii, 899.
 direct combustion of, for carbon and sulphur (ISHAM and AUMER), A., ii, 898.
 apparatus for the estimation of carbide in (MARS), A., ii, 429.
 estimation of carbon in (ORTHEY), A., ii, 131.
 estimation of carbon in, by means of an electric furnace (JOHNSON), A., ii, 630.
 estimation of chromium and nickel in (CAMPBELL and ARTHUR), A., ii, 779.
 estimation of chromium, molybdenum, nickel, and vanadium in (BLAIR), A., ii, 900.
 estimation of chromium and tungsten in (HINRICHSSEN and WOLTER), A., ii, 900.
 volumetric estimation of manganese in (SACERDOTI), A., ii, 228; (RAYMOND), A., ii, 325.
 estimation of phosphorus in (CHESNEAU), A., ii, 427; (MISSON), A., ii, 732.
 estimation of sulphur in (JABOULAY), A., ii, 223; (ORTHEY), A., ii, 731.
 apparatus for the estimation of sulphur in (RAYMOND), A., ii, 628.
 estimation of tungsten in, containing chromium (V. KNORRE), A., ii, 779.
 estimation of vanadium in (CAMPBELL and WOODHAMS), A., ii, 901.
Steels, gases occluded in (BELLOC), A., ii, 108.
 containing phosphorus (DE KRYLOFF), A., ii, 698.
 See also Nickel steel.
Iron (in general) detection, estimation, and separation:—
 precipitation of, by ammonia in presence of tartaric acid (STRECKER), A., ii, 71.
 and copper, detection of (DELEPINE), A., ii, 633.
 estimation of, by permanganate after reduction with titanous sulphate (NEWTON), A., ii, 533.
 estimation of ferrous (KNIGHT), A., ii, 323.
 estimation of ferric (BOLLENBACH), A., ii, 229.
 alumina, and phosphoric acid, estimation of, in presence of each other (COCKSEY), A., ii, 987.

Iron (in general) detection, estimation, and separation:—

- and chromium, volumetric estimation of, by means of titanous chloride (JATAK), A., ii, 778.
 and vanadium, estimation of, in presence of each other (EDGAR), A., ii, 736.
 apparatus for the estimation of carbide in (MAERS), A., ii, 429.
 estimation of carbon in (DE KONINCK and v. WINIWKARTER), A., ii, 320.
 apparatus for the estimation of carbon in (WIDEMANN), A., ii, 984;
 (GRZESCHUK), A., ii, 1071.
 volumetric estimation of manganese in (RAYMOND), A., ii, 323.
 estimation of phosphorus in (CHESNEAU), A., ii, 427.
 estimation of sulphur in (JABOULAY), A., ii, 223; (ORTHEY), A., ii, 731.
 apparatus for the estimation of sulphur in (RAYMOND), A., ii, 628.
 estimation of vanadium in (CAMPELL and WOODHAMS), A., ii, 301.
 colorimetric method for the estimation of small percentages of, in copper alloys (GREGORY), T., 93.
 and vanadium, simultaneous volumetric estimation of, in ferro-vanadium (WARYNSKI and MDIVANI), A., ii, 736.
 pure ferric oxide as a standard substance for the estimation of, in hydrochloric acid solution (BRANDT), A., ii, 899.
 volumetric estimation of, in ferric compounds (MUIR), A., ii, 228.
 estimation of, in reduced iron (FREICHS), A., ii, 538.
 separation of, from cobalt and nickel (LARY), A., ii, 988.
 separation of, from indium (MATHERS), A., ii, 434.
 separation of, from manganese (MOORE and MILLER), A., ii, 154.
 separation of thorium, titanium, and zirconium from (DITTRICH and FREUND), A., ii, 135.
Iron group, determination of the melting points of elements of the, by a new radiation method (BRIGGS), A., ii, 41.
Iron and aluminium groups, qualitative analysis of the (NOYLS, BEAV, and SPEAR), A., ii, 538.
Iron oxide contact process (KEFFELER, D'ANS, SUNDELL, and KANSEL), A., ii, 482.
Isatin and its methyl derivative, preparation of (BAUER), A., i, 695.
Isatin, action of ethylamine on (HASLINGER), A., i, 454.

Isatinethylamine, 5:7-dibromo- (HASLINGER), A., i, 454.

α -Isatoxime (WIELAND and GUELLA), A., i, 1013.

Isomeric change, action of carbonyl chloride as an agent for arresting (LOWRY and MAGSON), T., 118.
 rearrangement (FAWORSKY and BOWMANN), A., i, 15.

Isomerides, reciprocal transformation of under the influence of chemical induction (TANATAR), A., i, 759.
 structural, formal types of (LAAR), A., i, 749.

Isomerism, dynamic. See under Affinity, chemical.
 structural (MARINO), A., ii, 833.

Isomorphism (GOSSEN), A., ii, 366.

Isomorphous substances and their mixtures, specific heats and heats of fusion of (BOGOTAVLENSKY and WINGGENDOFF), A., ii, 806.

J.

Jateorrhizine and its derivatives from calumba root (FEIST), A., i, 101.

Jecorin and other levinthim-like substances from the liver of the horse (BASKOFF), A., i, 1029.

Jeffropinic acids, α - and β -, and α - and β -Jeffropinolic acids (TSCHURCH and LEUCHTENBERGER), A., i, 197.

Jet, origin of (SPIELMANN), A., ii, 505.

K.

Kaersutite from Linosa and Greenland (WASHINGTON and WRIGHT), A., ii, 863.

"**Kalkstickstoff**." See Mammal experiments.

Kaolin, formation of (HÄRSEL), A., ii, 956.

Katabolism, protein, action of hydrocyanic acid on (LOWRY, WOLF, and OSERBERG), A., ii, 312.

Kayana abura. See *Trypt. aciflor*, oil of.

Keratin, state of combination of sulphur in the molecule of (BARDISCH), A., i, 710.

Keratins, various, glutamic acid in (ABDERHALDEN and FREICH), A., i, 1029.

Ketchup, detection and estimation of benzoic acid in (REED), A., ii, 74.
 estimation of benzoic acid in (LA WALL and BRADSHAW), A., ii, 135.

Keten (STAUDINGER and KLEVER), A., i, 246, 334; (WILSMORE and STEWART), A., i, 818.

- Keten, some reactions of (CHICK and WILSMORE), P., 77.
polymeride of (CHICK and WILSMORE), T., 946; P., 100.
- Ketens (STAUDINGER and KLEVER), A., i, 246, 318; (STAUDINGER), A., i, 410, 411; (STAUDINGER and OTT), A., i, 602.
- Keto-alcohol, $C_{27}H_{44}O_2$, and its acetate and phenylhydrazone, from the oxidation of the substance, $C_{27}H_{48}O_2$, from cholesterol (PICKARD and YATES), T., 1683; P., 121.
- Keto-alcohols, synthesis of (BLAISE and HERMAN), A., i, 248.
- 2-Keto-1-alkyldihydroquinoxalines, preparation of (LANGE), A., i, 839.
- 7-Ketobehenic acid (SHUKOFF and SHESTAKOFF), A., i, 755.
- 1-Keto-1:2-dihydrobenzoxazole and the action of aniline on (YOUNG and DUNSTAN), T., 1956.
- 4-Keto-1:4-dihydroquinoline-2-carboxylic acid (HELLER and SOURLIS), A., i, 913.
- 2-Ketodihydrothionaphthen, 1:1-di-bromo- (BEZDZIK, FRIEDLÄNDER, and KOENIGER), A., i, 200.
- 5-Keto-4-dimethylamino-1:2:2:4-tetramethylpyrrolidine and its additive derivatives (KOHN), A., i, 829.
- 5-Keto-4-dimethylamino-2:2:4-trimethyltetrahydrofuran and its additive salts (KOHN), A., i, 819.
- 5-Keto-3:3'-diphenyl- Δ^{10} -biscyclopentenylidene and its hydrochloride (BORSCHKE and MENZ), A., i, 148.
- 2-Keto-4:5-diphenyltetrahydroglyoxaline, bromo-derivatives (BILTZ and RIMPEL), A., i, 574.
- α -Keto- β -ethylheptolactone- γ -carboxylic acid and its hydrolysis (FICHTER and KAPPELER), A., i, 660.
- α -Ketoglutaric acid (BLAISE and GAULT), A., i, 713.
- 2-Ketohydrindene. See β -Hydrindone.
- Ketohydropyridines, α -amino- and α -hydroxy- (PICCINI), A., i, 908.
- Keto-ketens and their reactions (STAUDINGER and KLEVER), A., i, 318; (STAUDINGER), A., i, 410, 411.
- 5-Keto-4-methylamino-1:4-di- and -1:2:2:4-tetra-methylpyrrolidines and their phenylthiocarbamides (KOHN), A., i, 829.
- 5-Keto-4-methylamino-2:2:4-trimethyltetrahydrofuran and its phenylthiocarbamide (KOHN), A., i, 819.
- 2-Keto-1-methyldihydronaphthalene, chloro-derivatives (FRIES and HEMFELMANN), A., i, 730.
- 2-Keto-1-methyldihydro-1:2'-naphtha-quinoxaline (LANGE), A., i, 839.
- 4-Keto-2-methyl-1:4-dihydroquinoline and its additive salts (HELLER and SOURLIS), A., i, 913.
- 2-Keto-1-methyltetrahydronaphthalene, chloro-derivatives (FRIES and HEMFELMANN), A., i, 730.
- Ketone, $C_6H_8O_2N_2$, and its semicarbazone, from the trioxime from 3-nitroso-2:5-dimethylpyrrole (MORELLI and MARCHETTI), A., i, 363.
- $C_7H_{10}O$, and its oxime, benzoyloxime, and semicarbazone, from Δ^1 -cyclohexeneacetic acid (WALLACH), A., i, 426.
- $C_8H_{14}O$, from the action of calcium carbide on butanone (BODROUX and TABOURY), A., i, 854.
- $C_9H_{12}O$, and its semicarbazone, and hydroxymethylene compound, from the diketone, $C_9H_{14}O_2$, from santene (SEMMLER and BARTELT), A., i, 38.
- $C_9H_{14}O$, and its oxime and semicarbazone, from 1-methyldicyclo-2:2:2-octan-7-ol (SEMMLER and BARTELT), A., i, 38.
- $C_9H_{14}O$, from pinene (ENDERSON and HELLERON), T., 292; P., 31.
- $C_9H_{14}O$ and $C_{11}H_{18}O_2$, from santene glycol (SEMMLER and BARTELT), A., i, 355.
- $C_{12}H_{18}O$, and its oxime and semicarbazone, from turmeric oil (RUPPE), A., i, 95.
- $C_{14}H_{22}O$, and its oxime, from 1-methyl- Δ^2 -cyclohexen-4-ol (MANICH and HÄNDEL), A., i, 276.
- $C_{15}H_{22}O_2N_2$, and its oxime, from dibenzoylnitrobenziminazopiperidine (SPIEGEL and KAUFMANN), A., i, 293.
- $C_{20}H_{30}O$, from methyl glutarate and magnesium phenyl bromide (FECHT), A., ii, 916.
- Ketone *ortho*-ethers, preparation of (HESS), A., i, 762.
- Ketones, formation of, during acetic fermentation (FARNSTEINER), A., i, 318.
- formation of, from amides of α -bromofatty acids (MOSSLER), A., i, 133.
- interaction of, with β -benzylhydroxylamine (SCHEIBER), A., i, 763; (SCHEIBER and BRANDT), A., i, 764.
- action of calcium carbide on (BODROUX and TABOURY), A., i, 854.
- condensation of, with citral hydrate (COULIN), A., i, 1000.

- Ketones**, reaction of, with diphenylmethanedimethylhydrazine (v. BRAUN), A., i, 700.
- action of mercuric iodide on, in alkaline solution (MARSH and STRUTHERS), P., 266.
- action of a mixture of mercury diethyl and sodium on (SCHORIGIN), A., i, 881.
- condensation of, with *p*-phenylenediamine, β -naphthylamine, and β -naphthylhydrazine (ROTHENFUSSER), A., i, 52.
- condensation of, with ethyl phenylpropionate (RUHEMANN), T., 431; P., 52.
- action of alcoholic potassium hydroxide on (MONTAGNE), A., i, 988.
- action of sodamide on (HALLER and BAUER), A., i, 987.
- action of sodium and alkyl haloids on (SCHORIGIN), A., i, 866.
- containing the group, $\text{CH}_2\text{CO}\cdot\text{CH}_2$; condensation of, with esters in presence of sodium ethoxide (CLARKE, LAPWORTH, and WECHSLER), T., 50.
- of the type, $\text{CHR}\cdot\text{CH}\cdot\text{CH}\cdot\text{CH}\cdot\text{CO}\cdot\text{R}$, action of hydroxylamine on (CUSA and TERNI), A., i, 762.
- naturally occurring aliphatic, synthesis of certain, and their possible mode of formation in the organism (DAKIN), A., i, 134.
- aromatic unsaturated, coloured hydrohalides of (FRANCISCONTI and CUSMANO), A., i, 801.
- cyclic, new (BLANC), A., i, 654.
- synthesis by means of the carboxylic esters of (KOLZ, BIEBER, HESSE, and SCHWARZ), A., i, 24.
- tautomerism of (MANNICH and HANCO), A., i, 275.
- condensation of, with aromatic aldehydes (WALLACH, MALLISON, and MARCUS), A., i, 124.
- reaction of, with diphenylmethanedimethylhydrazine (v. BRAUN), A., i, 737.
- fatty, melting points of the *p*-nitrophenylhydrazones of, and their identification (DAKIN), A., i, 234.
- hydroaromatic (CROSSLEY and GILLING), P., 130, 281.
- $\alpha\beta$ -unsaturated, reduction of (SKITA, ARDAN, and KRAUSS), A., i, 555.
- See also β -Acetoxy-ketones, Amino-ketones, β -Hydroxy- $\alpha\alpha$ -dialkyl ketones, Hydroxy-ketones, and Triketone
- Ketones**, thio-derivatives of (FLORE, LAMBRECHT, and MCKEE), A., i, 785.
- Ketonic acid**, $\text{C}_8\text{H}_{12}\text{O}_8$, and its semicarbazone, from 1-methylcyclo-1:2:3- Δ^1 -octen-3-one (SEMMLER and BARTELT), A., i, 355.
- $\text{C}_8\text{H}_{12}\text{O}_8$, and its semicarbazone from the diketone from saccharose (SEMMLER), A., i, 38.
- $\text{C}_8\text{H}_{16}\text{O}_8$, and its semicarbazone, from the oxidation of apofenchone (BOUVEAULT and LEVALLOIS), A., i, 193, 195.
- $\text{C}_{12}\text{H}_{20}\text{O}_8$ and $\text{C}_{12}\text{H}_{22}\text{O}_8$, and their phenylhydrazones, from santolin (ANGELI and MARINO), A., i, 543.
- $\text{C}_{20}\text{H}_{32}\text{O}_8$, and its oxime, from the reduction of the acid, $\text{C}_{20}\text{H}_{32}\text{O}_2\text{N}$ (WINDAUS), A., i, 728.
- $\text{C}_{26}\text{H}_{42}\text{O}_8$, and its oxime and potassium salt, from cholestenone (BOEKE and GARDNER), T., 1330; P., 173.
- Ketonic acids**, dibasic (BLAISE and GAULT), A., i, 713.
- naphtharesorcinol as a reagent for (MANDEL and NEUBERG), A., ii, 993.
- α -Ketonic acids, determination of the constitution of isomeric derivatives of (MEYER), A., i, 26.
- Ketonic and enolic compounds**, behaviour of, with diazo-compounds (FISKE and WILLIAMS), A., i, 126.
- the ammonia reaction for distinguishing between (MICHAEL and HIBBERT), A., i, 78.
- tertiary amines as reagents for distinguishing between (MICHAEL and SMITH), A., i, 913.
- acetyl chloride and acetic anhydride as reagents for distinguishing between (MICHAEL and MURPHY), A., i, 919.
- β Ketonic esters, new synthesis of (ZELINER), A., i, 243, 759; (STOLLER), A., i, 319.
- Keto-2 phenylbenzotriazine**, α -cyano-amino (PIERRO), A., i, 925.
- Keto-2 phenylidihydrobenzotriazine**, α -cyanoamino (PIERRO), A., i, 926.
- 4-Keto-2 phenyliminotetrahydrothiophen-3 dicarboxylic acid**, ethyl ester, and its isomeric (RUHEMANN), T., 627; P., 53.
- Keto-2 phenylnaphthatriazine** (PIERRO), A., i, 926.
- 3-Keto-1:2:2:4-tetramethylpyrrolidine-4-amino**, and its phenylthiocarbamate (KOHN), A., i, 829.
- 2-Keto-1:4:6:6-tetramethyl- Δ^2 -tetrahydropyridine**. See 1:1:6:6-Tetramethyl- Δ^2 -tetrahydropyridine.

Keto-2-thio-5-methylthiazolidine-3-acetic acid (KÖRNER), A., i, 510.
Keto-2-thiothiazolidine-3-acetic acid. See Rhodaninacetic acid.
Keto-2:3:6-trimethyl-2:6-diethylpiperidine and its nitrate (TRAUBE), A., i, 362.
Keto-2:2:4-trimethyltetrahydrofuran, 4-amino-, and its phenylthiocarbamide (KÖHN), A., 819.
Keto-4:6:6-trimethyl- Δ^3 -tetrahydropyridine. See 4:6:6-Trimethyl- Δ^3 -tetrahydro-2-pyridone.
kidney, frog's, colloid nature of pigments in relation to their behaviour in the (HÖBER and KEMPNER), A., ii, 716; (HÖBER and CHASSIN), A., ii, 875.
kidney, action of the digitalis group on the (JONESCU and LOEWI), A., ii, 720.
 exercised, effect of poisons on the perfusion of (SOLLMANN and HATCHER), A., ii, 210.
 perfused, tissue respiration in (VERNON), A., ii, 53.
kidney secretion of indigo-carmin, methylene-blue, and sodium carminate (SHAFER), A., ii, 769.
lactic theory, application of the, to the metals (REBOUL), A., ii, 934.
metics. See under Affinity, chemical.
ri-abura. See Wood oil, Japanese.
Jeldahl's method (SALKOWSKI), A., ii, 1070.
shankite from Chile (PALACHE and WARREN), A., ii, 1047.
rypton, xenon, helium, and neon, percentage of, in the atmosphere (RAMSAY), A., ii, 688.
 density of (MOORE), T., 2181; P., 272.

L.

laccase, oxidations with, in presence of salts (v. EYLER and BOLIN), A., ii, 1021.
lacquer, Japanese (MIYAMA), A., i, 437.
lactaldehyde, synthesis of, and its derivatives (WOHL and LANGE), A., i, 932, 943.
lactaldehydeacetal, preparation and reactions of (WOHL and LANGE), A., i, 942, 943.
actam, $C_{11}H_{12}ON_2$, from α -benzoyl-aminoisobutyramide (MOHR and GEIS), A., i, 339.
 $C_{12}H_{13}O_2N$, from the menthylurethane of ethyl lactate (VALLER), A., i, 976.

XCIv. ii.

Lactic acid (*i-ethylidenelactic acid, α -hydroxypropionic acid*), formation and decomposition of, by micro-organisms (MEISSNER), A., ii, 414.
 in eclampsia (TEN DOESSCHATE), A., ii, 122; (DONATH), A., ii, 213.
 formation of, in muscle (LATHAM), A., ii, 609.
 action of, on the isolated and surviving heart of mammals (BACKMAN), A., ii, 612.
 in wine (PARIS), A., ii, 543.
 comparison of methods of estimating (TRUMMER), A., ii, 905.
 estimation of, in animal fluids and organs (JERUSALEM), A., ii, 905.
 estimation of, in lactates (PÄRSSLER), A., ii, 438.
 estimation of, in musts and saccharine liquids (LEGLER), A., ii, 438.
Lactic acid, bismuth salts (TELLE), A., i, 851.
 glucinum salt (GLASMANN and NOVICKY), A., i, 121; (TANATAR and KUROVSKI), A., i, 759.
d-Lactic acid (*paralactic acid, sarcolactic acid*), formation of, in the autolysis of muscle (INOUE and KONDO), A., ii, 209.
Lactic acids, thio-, optically active (LOVEN), A., i, 714.
Lactic acid fermentation. See under Fermentation.
Lactone, $C_8H_9O_2N$, and its acetyl and bromo-derivatives, from 3-methylpyrazolone and ethyl acetoacetate (WOLFF and SCHREINER), A., i, 291; (BÜLOW and SCHAUB), A., i, 579.
 $C_8H_{10}O_2N_2$, from 3-methylpyrazolone and ethylmethylacetoacetate (WOLFF and SCHREINER), A., i, 291.
 $C_{16}H_{13}O_2N_3$, from 1:3-dimethylpyrazolone and ethyl methylacetoacetate (WOLFF and SCHREINER), A., i, 291.
 β -Lactone, $C_{20}H_{11}O_3$, from diphenylketen and quinone (STAUDINGER), A., i, 410.
Lactone dyes (HERZIG and EINSTEIN), A., i, 899.
Lactones and the corresponding hydroxyacids, pharmacological action of certain (MARSHALL), A., ii, 1060.
 of the pyrazole series (WOLFF and SCHREINER), A., i, 291.
 β -Lactones, formation of (STAUDINGER), A., i, 410, 411.
 γ -Lactones, formation of (SHUKOFF and SCHENAKOFF), A., i, 755.
Lactones. See also Iodolactones.

- Lactose** (*milk sugar*) and its derivatives, scission of, by diastase (BIERRY and GIAJA), A., i, 1031.
forms of (HUDSON), A., i, 952.
heats of solution of the three forms of (HUDSON and BROWN), A., ii, 665.
action of calcium hydroxide on (KILIANI), A., i, 128, 715.
condensation of, with formaldehyde (ROSENBERG), A., i, 320.
estimation of (SHIMIDZU), A., ii, 991.
estimation of, in milk (CARREZ), A., ii, 236; (GUÉRIN), A., ii, 329.
- Lævulosazine** (*fructosazine*, 2,5-ditetrahydroxybutylpyrazine) and its octa-acetyl derivative (STOLTE), A., ii, 51.
degradation of, in the animal body (STOLTE), A., i, 833.
- Lævulose** (*d-fructose*), fermentation of, by yeast juice (HARDEN and YOUNG), P., 115.
oxidation of (NEF), A., i, 7.
behaviour of, towards dilute sodium hydroxide (MEISENHEIMER), A., i, 319.
in diabetic urine (BORCHARDT), A., ii, 518.
tetra- and penta-acetates, crystallised (BRAYNS), A., i, 329.
precipitation of, by basic lead acetate (GEERLINGS), A., ii, 991.
detection of, in presence of other natural sugars (PIERARRETS), A., ii, 542.
- Lævulose-*o*-nitrophenylhydrazone** (RECLAIR), A., i, 1044.
- Lamp**, Belfier. See Belfier lamp.
- Langbeinite** and vanthodite (NACKEN), A., ii, 692.
- Lanthanum** ammonium molybdate (BARBIERI), A., ii, 595.
sulphate, formation of, from lanthanum oxalate by sulphuric acid (WIRTH), A., ii, 579.
disulphide (BLIZY), A., ii, 1038.
- Lanthanum**, cerium, and didymium, quantitative spectra and separation of (POLLOCK and LEONARD), A., ii, 615.
- Lassallite**. See Pilolite.
- Latent heat of fusion**. See under Thermochemistry.
- Laterite**, origin of (CHAFFARD and LÉMOINE), A., ii, 203.
- Laurane**, $C_{24}H_{48}$, from lauril oil (MATTHEWS and SANDER), A., i, 418.
- Laurel-leaf oil** (HAENSEL), A., i, 665.
- Laurel oil**, "unsaponifiable matter" of (MATTHEWS and SANDER), A., i, 417.
- Lauric acid**, α -hydroxy- (POWER and ROBERTSON), A., ii, 725.
- Lavas** of the recent eruption of Etna (LACROIX), A., ii, 766.
- Lavender oils**, observations on the analysis of (JEANGARD and SATIE), A., ii, 232.
- Lead**, atomic weight of (BAXTER and WILSON), A., ii, 281.
electrochemistry of (CUMMING), A., ii, 248.
heating effects produced by Roentgen rays in (BUMSTEAD), A., ii, 542.
and selenium, freezing-point diagram of (FRIEDRICH and LEROUX), A., ii, 696.
poisoning. See under Poisoning.
- Lead alloys** with aluminium (GWYER), A., ii, 286.
with antimony, estimation of arsenic in (HOWARD), A., ii, 429.
with calcium (DONSKOI), A., ii, 272.
with cobalt (DUCCELMEZ), A., ii, 594; (LEWKONJA), A., ii, 853.
with nickel (VOSS), A., ii, 195.
with palladium, nature of (PESCHINAEV PASHSKY), A., ii, 869.
with tin (ROSENHAIN and TUCKER), A., ii, 1038.
hardness of (SAPOSHNIKOFF), A., ii, 294.
estimation of lead in (HOLZMANS), A., ii, 633.
- Lead compounds**, solubility of, in water (PLEISSNER), A., ii, 40.
- Lead chloride**, analysis of (BAXTER and WILSON), A., ii, 281.
ammonium chromate (GREGG), A., ii, 691.
hydroxide, heterogeneous colloid (SZILARD), A., ii, 197.
potassium periodide, Wells' composition and formula of (MELPER), P., 97.
nitrate and sodium nitrate, temperatures of spontaneous crystallisation of mixtures of (ISAAC), T., 39; P., 39.
nitrites (CHIESOTTI), A., ii, 845.98.
potassium nitrites, complex Miedrum, P., 97.
oxides, velocity of reduction of, by carbon monoxide and the existence of a suboxide (BRISLEE), T., 154.
peroxide, formula of, and the absorption of selenious acid on (MARINO), A., ii, 106, 833.
- Triplumbic tetroxide** (*red lead*), a combination of (PARTHELL), A., ii, 69, 227.
assay of (SACHER; PIESCZKE), A., ii, 228; (BECK), A., ii, 777.
comparison of two tests for (DEVILAP), A., ii, 597.

- lead sulphate, compound of, with arsenic sulphate (KÜHL), A., ii, 36.
- sulphide and its oxidation products, equilibrium in the reaction between (SCHENCK and RASSBACH), A., ii, 247.
- analysis of (JACOBSON), A., ii, 989.
- cad and silver assays in ores, dry (LOEUVY), A., ii, 323.
- colorimetric estimation of (WOUDSTRA), A., ii, 633.
- estimation of, volumetrically (BOLLENBACH), A., ii, 68; (KOCH), A., ii, 227.
- estimation of, in alloys (ELBORNE and WARREN), A., ii, 735.
- estimation of, in lead-tin alloys (HOLZMANN), A., ii, 633.
- estimation of, in ores (LOW), A., ii, 536.
- copper, and silver, estimation of, in complicated organic salts (RINDL and SIMONIS), A., ii, 432.
- See also Radio-lead.
- rad ions, univalent, existence of, in aqueous solutions (DENHAM and ALLMAYD), T., 424; P., 14.
- raf, causes of the displacement of absorption bands in the (IWANOWSKI), A., ii, 57.
- saves, yellow autumn, pigment of (TSVETI), A., i, 279.
- scithid formation (KYES), A., ii, 215.
- scithin, chemistry of (MAYER), A., i, 243.
- methods for the preparation of, from plant seeds (SCHULZE), A., i, 385.
- physico-chemical researches on (FORGES and NEUBAUER), A., ii, 90.
- stability of (LONG), A., i, 385.
- behaviour of, with bile salts, and its occurrence in bile (LONG and GEPHART), A., ii, 872.
- behaviour of emulsions of, with metallic salts and certain non-electrolytes (LONG and GEPHART), A., i, 385.
- preparation of choline from (RICKEL), A., i, 395.
- quantitative recovery of choline from (MOREZZI), A., i, 395; (MACLEAN), A., i, 396.
- the biological importance of (GLIKIN), A., ii, 120.
- of the heart muscle, amount of choline in (MACLEAN), A., ii, 907.
- partition of, in the organism (NERKING), A., ii, 608.
- molybdenum compounds of (EHRNFELD), A., i, 598.
- estimation of, in milk (NERKING and HAENSEL), A., ii, 999.
- Leesbergite, the so-called (BRUHNS), A., ii, 703.
- Legumelin from the pea, hydrolysis of (OSBORNE and HEYL), A., i, 928.
- Legumin from the vetch, hydrolysis of (OSBORNE and HEYL), A., i, 843.
- Lemon, estimation of citral in essence of (BRUVIANTS), A., ii, 330.
- Lemon grass oil, estimation of citral in (BLOCH), A., ii, 782.
- Lemon oil, detection of small quantities of turpentine in (CHACE), A., ii, 908.
- Lens, crystalline, chemico-physical investigation of the (BOTTAZZI and SCALINCI), A., ii, 966, 1054.
- Lepidolite, manufacture of lithia from (SCHIEFFELIN and CAPPON), A., ii, 690.
- Leucine (α -amino-n-hexonic acid) and its salts and methyl derivative and its aurichloride (KUDIELKA), A., i, 511.
- from casein (HECKEL), A., i, 231.
- from the *Ligamentum nuchae* of oxen (SAMEC), A., i, 231.
- fraction from protein hydrolysis (EHRlich and WENDEL), A., i, 302.
- resolution of, into its optical components, and its formyl derivatives (MARKO), A., i, 772.
- oxidation of, with hydrogen peroxide (DAKIN), A., i, 80.
- L-Leucine derivatives, synthesis of (ABDERHALDEN and HIRSZOWSKI), A., i, 887.
- isoLeucine (α -amino- β -methylvaleric acid), preparation of, from the hydrolytic products of proteins (LEVENE and JACOBS), A., i, 375.
- synthesis of (EHRlich), A., i, 396; (BRASCH and FRIEDMANN), A., i, 607.
- Leucines, isomeric, behaviour of, in the liver (EMEDEN), A., ii, 515.
- Leucite, utilisation of (MANUELLI), A., ii, 386.
- influence of micro-organisms on the utilisation of the potassium in, by plants (DE GHAZIA and CAMIOLA), A., ii, 415.
- as manure (ALVIST and VENDITORI), A., ii, 61; (MONACO), A., ii, 424.
- Leucocalizarin (1:2-dihydroxyanthracenol) (GRANDMOUGIN), A., i, 786.
- Leuco-base, $C_{20}H_{23}N_3$, from naphthoblu (NOELTING and PHILIPP), A., i, 296.
- Leuco-2-benzoyloxanthen (HELLER and V. KOSTANECKI), A., i, 445.
- Leucocytes, the death of (ROSS), A., ii, 868.
- the vacuolation of (ROSS), A., ii, 868.

- Leucomaines** of cod liver oil (HAWK), A., ii, 308.
- Leuco-2-methylisorosindone** diacetate (KEHRMANN and STERN), A., i, 221.
- Leucoprotease** and anti-leucoprotease of mammals and birds (ORIE and BARKER), A., ii, 117.
- Leucoquinizarin** (GRANDMOUGIN), A., i, 808.
- Leucorosindone** diacetate (KEHRMANN and STERN), A., i, 221.
- Leucoisorosindone** diacetate (KEHRMANN and STERN), A., i, 220.
- Leucotannin** and its acetyl derivatives (NIERENSTEIN), A., i, 91.
- Leucothioindigotin** and its diacetyl derivative (FRIEDLÄNDER), A., i, 673.
- Leucyl- β -aminobutyric acid** and its copper salt and anhydride (KAY), A., i, 773.
- Leucyl-L-histidine** and its copper salt (FISCHER and CONE), A., i, 1003.
- Leucyl- α -methylserines**, *A*- and *B*-, and their phenylcarbimides (KAY), A., i, 774.
- Leucyl-L-tyrosine** (ABDERHALDEN and HIBSZOWSKI), A., i, 888.
- Leucyl-L-valine** and its methyl ester and anhydride (FISCHER and SCHEIBLER), A., i, 958.
- Light**. See under Photochemistry.
- Lignin**, composition and reactions of (KLASON; KLASON and FÄGERLIND), A., i, 717.
- cellulose, and curin, separation of (KÖNIG; MATTHEWS), A., ii, 236.
- Lignosulphonic acid**, barium salt (KLASON), A., i, 717.
- Lime**. See Calcium oxide.
- Limulus heart**, muscle and nerve of, relative resistance of, to drugs (MEEK), A., ii, 508.
- Linaloe seeds**, oil from (ROUPE BERGERAND FIET), A., i, 358.
- Linalool**, hydrogenation of, by means of nickel and hydrogen (ENKLAAR), A., i, 924.
- dithionide (ERDMANN), A., ii, 831.
- Linalyl acetate**, thioanide of (ERDMANN), A., ii, 831.
- methyl ether (BACOS), A., i, 815.
- Linaria**, glucosides of (KLOBB), A., i, 903.
- Linaria phenol** and its acetate (KLOBB), A., i, 901.
- Linking**, carbon-nitrogen, which substances contain a readily resolvable single (FENDEL), A., i, 83.
- Linkings**, conjugated, addition of the higher oxides to (WIELAND and STENZ), A., i, 517.
- Linkings**, double and triple, action of ozone on (HARRIES), A., i, 75, 367; (MOLINARI), A., i, 244, 849.
- resolution of, by addition of water, terpene compounds (WIELAND), A., i, 429.
- Linseed oil**, alcoholysis of (HALLER), A., i, 123.
- Lipase** in embryonic tissues (MENDEL and LEAVENWORTH), A., ii, 297.
- inhibiting action of fluorides of (AMBERG and LOEWENHAFT), A., i, 235.
- Lipoid liquefaction** and cytolysis, relation between (v. KNAFFEL-LENZ), A., ii, 610.
- Lipoids** (FRÄNKEL; BOLAFFIO), A., i, 377.
- percentage of iron in (GURIN), A., ii, 407.
- Lipolysis**, agglutination, and hemolysis (NEUBERG), A., ii, 708.
- Lippianol** from *Lippia salicaria* (POWER and TUTIN), A., ii, 59.
- Lippia scaberrima* (Eichl. ex Benth), constituents of (POWER and TUTIN), A., ii, 59.
- Ligneurs**, identification of thujone in (DUPARC and MOXNER), A., ii, 905.
- Liquid**, polarimetric measurements with small quantities of (DIXON), A., ii, 647.
- Liquid mixtures**, electro-optical properties of (CHAUDIER), A., ii, 788.
- Liquids**, new method for determining the specific heats of (RICHARDS and ROWE), A., ii, 806.
- torsional elasticity of (LAUER and TAMMANN), A., ii, 667.
- surface tension of, investigated by the method of jet vibration (FERRESEN), A., ii, 158.
- relation between compressibility, surface tension, and other properties of (RICHARDS and MATTHEWS), A., ii, 158.
- which boil above 160°, apparatus for estimating the expansion of (TODD), A., ii, 907.
- time-law of the capillary rise of, and the relation ship of velocity to the chemical constitution (OSWALD and GÖPPEL-SCHÖDER), A., ii, 263.
- density of, below zero (TIMMERMAN), A., ii, 85.
- determination of the molecular weights and critical temperatures of, by the aid of drop weights (MORAN and STEVENSON), A., ii, 326; (MORAN and HIGGINS), A., ii, 668.
- polymorphism of (VORLÄNDER), A., ii, 22.

- liquids**, fermented, detection of methyl alcohol in (WOLFF), A., ii, 72.
 fermenting, simple form of apparatus for observing the rate of absorption of oxygen by (ADENBY), A., ii, 781.
 homologous, orthobaric densities of (TER-GAZARIAN), A., ii, 666.
 inflammable, of low boiling point, relation between the ignition temperature and the vapour pressure of (CHARITSCHKOFF), A., ii, 255.
 low-boiling, arrangement for distilling (V. BARTAL), A., ii, 929.
 organic, detection of free acids in (REITON), A., ii, 781.
liquorice, sweet substance from (RASENACK), A., i, 818.
lithia. See Lithium oxide.
lithium in radioactive minerals (GLADITCH), A., ii, 9, 246; (RAMSAY and CAMERON), A., ii, 247.
 thermo-electric power of (BERNINI), A., ii, 255.
 solutions of, in liquid ammonia (RUFF and ZFNER), A., ii, 585.
lithium chloride, conductivity and viscosity of solutions of (GREEN), T., 2023; P., 187.
 and sucrose, conductivity and viscosity of mixtures of solutions of (GREEN), T., 2049; P., 187.
 effect of water on the decomposition curves of, in acetone and in pyridine (PATEN and MOTT), A., ii, 253.
 separation of, from the other alkali chlorides and barium chloride (KAHLEBERG and KRAUSKOPF), A., ii, 777.
 hydroxides, action of heat on (DE FORCRAND), A., ii, 493.
 nitrite and its decomposition by heat (RAY), P., 75.
 molecular volume of (RAY), T., 998; P., 75.
 oxide (*lithia*), manufacture of, from lepidolite (SCHIEFFELIN and CARPSON), A., ii, 690.
 thioantimonates (DONK), A., ii, 763, 859.
ver, capacity of the, to reverse the optical action of sugars (PFLÜGER), A., ii, 307.
 can the, form glycogen from optically active amino-acids? (GROBE), A., ii, 616.
 the smallest molecule from which the, can make glycogen (GROBE), A., ii, 307.
 changes in the nitrogenous constituents of the, when the kidneys are placed out of action (OLIVI), A., ii, 407.
Liver, higher fatty acids in the, after removal (LEATHES), A., ii, 1054.
 behaviour of isomeric leucines in the (EMBDEN), A., ii, 515.
 formation of acetoacetic acid in the (EMBDEN and ENGEL), A., ii, 515.
 formation of acetone in the (EMBDEN and MARX), A., ii, 515.
 nature of the fat in normal and pathological human (HARTLEY and MAVROCORDATO), A., ii, 210.
 the iron of the (SCAFFIDI), A., ii, 210.
 the nucleo-protein of the (LEVENE and MANDEL), A., i, 587.
 in chloroform necrosis (WELLS), A., ii, 974.
 of birds, formation of uric acid in the (FRIEDMANN and MANDEL), A., ii, 1054.
 of diabetic dogs, formation of acetoacetic acid in the (EMBDEN and LATTES), A., ii, 515.
 of the horse, jecurin and other lecithin-like substances from the (BASKOFF), A., i, 1029.
 of reptiles. See Reptiles.
Liver antolysis. See under Antolysis.
Liver disease, excretion of creatine and creatinine in (MELLANBY), A., ii, 54.
Livetin from egg yolk (PLIMMER), T., 1501; P., 190.
Lolium tenuidentum, fixation of free atmospheric nitrogen by, infested with a fungus (HANNIG), A., ii, 523.
Long leaf pine oil (TEMPLE), A., i, 355.
Lonicera xylosteum, pectus from the fruit of (BRIDEL), A., ii, 125.
Lubricating oils. See under Oils.
Luminescence, fluorescence, and chemical constitution (HANTZSCH), A., ii, 446.
Lung-tissue, decomposition of fat by (SIEBER), A., ii, 406.
Lupeol (VAN ROMBURGH), A., i, 39; (COHEN), A., i, 882.
 and its butyrate (COHEN), A., i, 884.
Lutecium (URBAIN), A., ii, 283, 849.
Lutidinamide (V. MEYER and HENNING), A., i, 911.
Lutidines. See Dimethylpyridines.
Lycopersicon esculentum. See Tomatoes.
Lymph, lymphagogue action of (CARLSON, GREER, and BECHT), A., ii, 611.
 excess of chlorides in (CARLSON, GREER, and LUCKHARDT), A., ii, 610.
Lymph formation, relative haemolytic power of lymph and serum under various conditions of (HUGHES and CARLSON), A., ii, 304.
Lymph glands. See Glands.

- Lysine, arginine, and histidine, amount of, in the hydrolytic products of various animal tissues (WAKEMAN), A., ii, 209.**
additive salts of (ACKERMANN), A., i, 774.
Lysinogen of the blood-disks (TAKAKI), A., ii, 512.

M.

- Magnesia. See Magnesium oxide.**
Magnesium-acetylene bromide and its reactions (ODDO), A., i, 748.
Magnesian stone, artificial, composition of (CORNU), A., ii, 590.
Magnesites, estimation of magnesium oxide in (MAYERHOFFER), A., ii, 431.
Magnesium and its hydride, spectrum of, as obtained by spark discharges under reduced pressure (BROOKS), A., ii, 242.
action of, metallic, on certain fatty acids (FENTON and Sisson), A., i, 243.
action of, on esters of brominated fatty acids (ZEITNER), A., i, 213; (STOLLÉ), A., i, 310.
direct interaction of, with alkyl haloids (SPENCER and CREWSON), T., 1821; P., 194.
interaction of, with aryl haloids (SPENCER and STOKES), T., 68.
and calcium, antagonistic action of (MELTZER and AUCH), A., ii, 312, 519.
Magnesium alloys with copper (URAZOFF), A., ii, 186; (SAHMEN), A., ii, 187.
with nickel (VOSS), A., ii, 195.
Magnesium compounds, colloidal and gelatinous (NEUBERG and REWARD), A., ii, 39.
Magnesium salts, abnormal behaviour of, on hydrolysis (DENHAM), A., ii, 380.
Magnesium bromide and iodide, molecular compounds of, with organic substances, reciprocal displacement of the constituents of, and their relative stability (MENSHUTKIN), A., ii, 170.
Tarbid, formation of (PRING), T., 2106; P., 241.
carbonate, reaction of, with potassium hydrogen carbonate and water (BÜCHNER), A., ii, 184.
artificial, agronomical equivalent of (KANAMORI), A., ii, 625.
ammonium chromate (GROFF), A., ii, 634.
oxide (Magnesia), reducibility of, by carbon (SLADE), T., 327; P., 22.

- Magnesium oxide and lime, bark of, the mulberry tree (NAKAGAWA), A., ii, 126.**
estimation of, in magnesites (MAYERHOFFER), A., ii, 431.
oxychloride formed by electrolysis of the residual solutions from the manufacture of potassium chloride and its importance for the preparation of bromine (HOFF), A., ii, 495.
phosphate, compound of, with methylamine (FRANCOIS), A., i, 153.
silicide (LEBEAU and BOSSNET), A., ii, 184.
sulphate and potassium sulphate system and sodium sulphate system (NACKEN), A., ii, 69.
influence of, on metalloidism (STILLÉ), A., ii, 767.
manuring with (DAIKYHARA), A., ii, 129.
top-dressing with (ZIEKER), A., ii, 625.
Magnesium organic compounds, isomeric (SCHMIDLIN and HOBSON), A., i, 239.
action of, on arsenious oxide (SAG and KANTOROWICZ), A., i, 191.
action of, on ethyl orthoform (KHOTINSKY and SEECHENOFF), A., i, 1032.
reducing properties of (LETELLIER), A., i, 242.
Magnesium ammonium and magnesium oxonium compounds, reciprocal transformations of (SCHMIDLIN and HOBSON), A., i, 254.
benzyl, cumyl, and tolyl dihalides (HENSE), A., i, 592.
methiodide, compound of, with anisyl ether (ZERAWITINOFF), A., i, 62.
phenyl bromide, action of, on dimethyl ether on (RECHLER), A., i, 159.
See also Grignard's reaction.
Magnesium, estimation of, volumetrically (ROSENTHALER), A., ii, 67; (RECHLER), A., ii, 632.
separation of, from the alkalis by alcoholic ammonium carbonate (GOOD and EDDY), A., ii, 632.
Magnesium pectolite from the dike of Burg, Hesse-Nassau (REINIG), A., ii, 291.
Magnetic behaviour of air, argon, and helium in relation to oxygen (TANZLER), A., ii, 152.
double refraction. See under Polar chemistry.
field, chemical reactions in a (BENNETT), A., ii, 756.

- agnetic field, decomposition of complex chemical compounds in a variable (ROSENTHAL), A., ii, 152.
See also Molecular magnetic field.
rotation. See under Photochemistry.
susceptibilities of complex ferric salts (PASCAL), A., ii, 756.
of certain iron compounds (BERNDR), A., ii, 1013.
of the oxygenated metallic radicles (PASCAL), A., ii, 1013.
of solutions (PASCAL), A., ii, 756, 927.
- Magneto-optical phenomena**, use of very low temperatures for the study of (BECQUEREL), A., ii, 3.
- Magnolia Kobus**, essential oil of (CHARABOT and LALOUE), A., i, 196; (ROURE-BERTRAND FILS), A., i, 558; (SCHIMMEL & Co.), A., i, 666.
- Maize**, effects of feeding with (BAGLIONI), A., ii, 619.
- manganese compounds as fertilisers for (SUTHERST), A., ii, 528.
- proteins of. See under Proteins.
- Malachite-green**, leuco-base of, reaction of, with haemoglobin (BUCKMASTER), A., ii, 613.
- Malacene**, a silicate of zirconium (CUMMING), T., 350; P., 28.
composition of (TSCHERNIK), A., ii, 862.
- Maleic acid**, alkaloidal salts, and their optical activity (HILDITCH), T., 704; P., 61.
- Maleic acid**, basic ferric salt (SCHOLZ), A., i, 604.
- Maleic acid**, dihydroxy-, titanium derivative. See Titan-di-hydroxymaleic acid under Titanium.
- Maleic acid** in the production of wine (MESTREZAT), A., ii, 723.
fermentation of, in the production of wine (ROSENSTIEHL), A., ii, 772.
estimation of (POZZI-ESCOT), A., ii, 1078.
estimation of, in food products (COWLES), A., ii, 904.
- Maleic acid**, bismuth salt (TELLE), A., i, 851.
ferric, ferrous, and basic ferric salts (ROSENTHALER and SIEBECK), A., i, 246.
- Malonaldehyde**, nitro-, condensation of, with acetylacetone (HALE and ROBERTSON), A., i, 634.
- Malonic acid** and its ester, preparation of, from chloroacetic acid (PHELPS and TILLOTSON), A., i, 757.
esterification of (PHELPS and TILLOTSON), A., i, 756.
- Malonic acid**, condensation of, with aldol and crotonaldehyde (RIEDEL), A., i, 501.
influence of substituting groups on the reactions of derivatives of (EINHORN, V. DIESBACH, FEIBELMANN, and LADISCH), A., i, 312.
complex iron compounds of (MATSUI), A., i, 853.
thioanilide of (RUHEMANN), T., 624.
- Malonic acid**, ferrous and ferric alkali salts (SCHOLZ), A., i, 603.
- rare earth salts (ERDMANN and WIRTH), A., ii, 694.
- Malonic acid**, ethyl ester, action of phenylthiocarbimide on (RUHEMANN), T., 621; P., 53.
sodium derivative, action of althylthiocarbimide on (RUHEMANN), T., 625.
action of monochloromethyl ether on (SIMONSEN), T., 1777; P., 212.
methyl ester, condensation of, with $\alpha\beta$ -unsaturated aldehydes (MEERWEIN), A., i, 90.
- Malonic acid**, cyano-, ethyl ester, thioanilide of, and its salts (RUHEMANN), T., 625.
action of ethyl chloroacetate on (RUHEMANN), T., 627; P., 53.
nitro-, ethyl ester, ammonium derivative, action of formaldehyde on, diethylamine salt, and nitrosamine (BATTAGLIA), A., i, 396.
- Malonic semichloride** (STAUDINGER and OTT), A., i, 602.
- Malonyl bromide**, dibromo- (STAUDINGER and KLEVER), A., i, 318.
derivatives, halogenated, liberation of iodine from hydriodic acid by certain (WHITELEY), P., 288.
- Malonylanilideoxime**, isonitroso-, and its aniline salt (WIELAND and GMEIN), A., i, 1018.
- Malonylbishydrazoneacetoacetic acid**, ethyl ester, a substance with three reactive methylene groups (BULOW), A., i, 253.
- Malonyldiurethane**, bromo-, preparation of, and the estimation of bromine in (WHITELEY), P., 288.
- Malonylureide**, ethyl ester (BOEHRINGER & SOHNE), A., i, 464.
- Malt**, the soluble and non-coagulable nitrogen compounds in (BROWN), A., ii, 883.
water-soluble polysaccharides of (BROWN), A., ii, 978.
- Maltase**, physico-chemical investigation of (PHILOCHE), A., i, 712; ii, 470.

- Maltose** and its derivatives, scission of, by diastase (DERRY and GLAJA), A., i, 1031.
- Mammalian uterus.** See Uterus.
- Mammals, heart of.** See Heart.
- leucoprotease and anti-leucoprotease of (ORR and BARKER), A., ii, 117.
- p*-**Mandelic acid**, velocity of esterification of, by means of alcoholic hydrogen chloride (KAILAN), A., ii, 28.
- Mandelonitrile glucoside.** Fischer's, formation of (AULD), T., 1281; P., 182.
- Manganese** and the periodic law (REY-SOLDS), A., ii, 41.
and its alloys with carbon (STADELER), A., ii, 592.
- Manganese alloys** with chromium (HINDERICH), A., ii, 856.
with copper (SADMEYER), A., ii, 187.
- Manganese compounds**, preparation of (DIEFFENBACH), A., ii, 697.
action of, on potatoes and sugar beet (GRÉGOIRE, HENDRICK, and CARPIATX), A., ii, 529.
as fertilisers for maize (SUTHERST), A., ii, 528.
with aluminium (HINDERICH), A., ii, 857.
- Manganese salts**, is the manurial action of, observable in the field? (V. FEILITZEN), A., ii, 61.
influence of, on vegetation (RHODIN), A., ii, 980.
- Manganese carbide** (STADELER), A., ii, 592.
nitride, Mn_3N_2 (HENDERSON and GATLEFF), A., ii, 485.
nitrides and their magnetic properties (SHUKOFF), A., ii, 484; (WEDEKIND and VEIT), A., ii, 1041.
dioxide and dimanganese trioxide, dissociation temperatures of, in air and oxygen (MEYER and ROTGERS), A., ii, 191.
action of hydrochloric acid on (HOLMES and MANTEL), A., ii, 765.
- Permanganate solutions**, optical investigation of the solution of (HANTSCH and ULABK), A., ii, 616.
- Manganese silicate** and calcium silicate, isomorphism of (GINSBERG), A., ii, 842.
sulphate and sodium fluoride, action of, on onions (NAMBA), A., ii, 618.
sulphide, spontaneous combustion of (HINDER), A., ii, 192.
- Manganous chloride**, transition temperature of (RICHARDS and WILSON), A., ii, 16.
- Manganese:**—
Manganous oxide, reduction of, by carbon (GREENWOOD, T.), ii, P., 188.
ammonium sulphates (LANGE), A., ii, 850.
- Manganese**, detection and estimation of, small quantities of (DUBO), A., ii, 70.
and chromium, detection of, in presence of each other (KARLSBERG), A., ii, 635.
modification of Volhard's method of estimating (MAYER), A., ii, 71.
estimation of, by means of potassium ferrieyanide (BOLLENEAR and LUCHMANN), A., ii, 1971.
estimation of, volumetrically, in iron and steel (RAYMOND), A., ii, 235.
estimation of, in iron and manganous ores (ORTHEY), A., ii, 898.
estimation of, volumetrically, in steel (SACREDOTT), A., ii, 228.
estimation of, in potable water (ERNYEN), A., ii, 135.
use of ammonium persulphate in the separation of, from copper in acid solutions (GOTSCHALK), A., ii, 43.
separation of, from iron (MOORE and MILLER), A., ii, 431.
- Manganese and iron minerals** from the crystalline schists of Brosten, Romania (BITTENCANT), A., ii, 555.
- Manganese ore deposits** of the Quêbe District, Brazil (DERRY), A., ii, 594.
- Manganous compounds.** See under Manganese.
- Mangolds**, experiments with different varieties and on the storage of (SOLLEMA and VAN DAALEN), A., ii, 618.
manurial experiments on, with calcium cyanamide and sodium nitrate (KLOPFEL), A., ii, 619.
- Mannitol hydrogen *p*-oxide** (TANABE), A., i, 409.
- Mannose**, fermentation of, by yeast juice (HARDEN and YOUSSEF), P., 115.
- d*-**Mannose**, oxidation of (NEF), A., i, 1.
- Mannose-*o*** and ***o*-nitrophenylhydrazones** and ***o*-nitrophenylosazones** (DECLAIRE), A., i, 1014.
- Manometer**, simple, for vacuum distillation (CEBILARD), P., 51.
- Mantles**, incandescence, application of combustion without flame to lighting with (MEINSTER), A., ii, 463.
- Manures**, influence of, on the competition of wheat (SAYDER), A., ii, 55.
green, persistence of the nitrogen of, in a high sandy soil (V. SEILHANS), A., ii, 727.

- Manures**, phosphatic, relation between the increased yield due to, and the amount of phosphoric acid in the soil (PILZ), A., ii, 423.
- estimation of alkaline earths in (FOERSTER), A., ii, 1072.
- estimation of potassium in (SCHENKE), A., ii, 321.
- Manurial experiments**, pot culture experiments in 1906-7 (VOELCKER), A., ii, 622.
- on barley (DAIKUHARA), A., ii, 128.
- on cereals (WAGNER), A., ii, 1066.
- on crops (UCHIYAMA), A., ii, 126.
- on oats (SEIDLER and STUTZER), A., ii, 1065.
- on pasture land (SOLBERG), A., ii, 422.
- on sugar beet (ANDRIK and URBAN), A., ii, 219, 1066; (GRÉGOIRE, HENDRICK, and CARPiaux), A., ii, 529.
- with ammonium salts, calcium cyanamide, and sodium nitrate (WAGNER, HAMANN, and MÜNZINGER), A., ii, 622.
- with ammonium nitrate (PFEIFFER, HEFNER, and FRANK), A., ii, 980.
- with ammonium sulphate (BACHMANN), A., ii, 980; (NAZARI), A., ii, 1068.
- with ammonium sulphate, calcium cyanamide, calcium nitrate, and sodium nitrate (NAZARI), A., ii, 1068.
- with ammonium sulphate and sodium nitrate (BAESSLER), A., ii, 127; (CLAUSEN), A., ii, 981.
- with basic slag-ammonia (BACHMANN), A., ii, 624.
- with calcium cyanamide (REMY; ASCHMAN and AREND; LÖHNIS and SABASCHNIKOFF), A., ii, 220; (STUTZER; NAMBA and KANOMATA; SJOLLEMA and DE WILDT), A., ii, 623; (HASELHOFF; KAPPEN), A., ii, 728.
- under different conditions (UCHIYAMA), A., ii, 128.
- with calcium cyanamide and Swedish calcium nitrate (v. FEILITZEN), A., ii, 890.
- with calcium cyanamide and sodium nitrate for mangolds (KLÖPFEL), A., ii, 619.
- with calcium cyanamide for potatoes (STUTZER), A., ii, 726.
- with calcium nitrate and calcium cyanamide (v. FEILITZEN), A., ii, 890.
- with lime (KANOMATA), A., ii, 624; (GUTHRIE and COHEN), A., ii, 889.
- Manurial experiments**, with lime and magnesia for the mulberry tree (NAKAMURA), A., ii, 126.
- with precipitated calcium phosphate (SÖDERBAUM), A., ii, 423.
- with dicyanodiamide (LOEW), A., ii, 775.
- with gypsum (TAKEUCHI), A., ii, 624.
- with "Kalkstickstoff," "Stickstoffkalk," and calcium nitrate (SJOLLEMA and DE WILDT), A., ii, 623.
- with leucite (ALVISI and VENDITORE), A., ii, 61; (MONACO), A., ii, 424.
- with artificial magnesium carbonate (KANAMORI), A., ii, 625.
- with magnesium sulphate (DAIKUHARA), A., ii, 129; (ZIRKER), A., ii, 625.
- with manganese compounds (SUTHERST), A., ii, 528; (GRÉGOIRE, HENDRICK, and CARPiaux), A., ii, 529.
- with manganese salts (v. FEILITZEN), A., ii, 61; (RHODIN), A., ii, 981.
- with different kinds of nitrates (SEBELIEN), A., ii, 61.
- with nitrogen in 1907 (SÖDERBAUM), A., ii, 980.
- with organic nitrogen, as compared with sodium nitrate (POPP), A., ii, 727.
- with old and new nitrogenous manures (NAZARI), A., ii, 1068.
- with new nitrogenous manures (v. FEILITZEN), A., ii, 981.
- for hemp (STÖHR), A., ii, 421.
- with sodium nitrate and ammonium sulphate (BAESSLER), A., ii, 127; (CLAUSEN), A., ii, 981.
- See also Plants and Soils.
- Manurial trials**, Swedish (BOLIN), A., ii, 422.
- Manurial value** of bone dust (UCHIYAMA), A., ii, 128.
- of bone and mineral phosphates (MONTANARI), A., ii, 128.
- Marcitine** and its aurichloride (ACKERMANN), A., i, 10.
- Mariotte-Boyle law**, application of a deduction from the (FEBENSTORFF), A., ii, 565.
- Mariotte's law**, apparent deviations from, and their influence on the measurement of small pressures (SCHEEL and HEUSE), A., ii, 1016.
- Marmot**, comparison of the hemolytic and toxic action of eel's serum on the (CAMES and GLEY), A., ii, 215.
- Marrubic acid** and its salts and ethyl ester, and **Marrubiin** (GORDIN), A., i, 344.
- Marsh gas**, exact analysis of (GRÉHAN), A., i, 493.

- Mass** of suitable precipitates, possibility of determining the, by observation of their rates of settling (KOHNS), A., ii, 92.
- Mass action** and **Mass law**. See under Affinity, chemical.
- Matter**, constitution of (PISSARJEWSKY), A., ii, 478.
- indestructibility of, and the absence of exact relations among the atomic weights (COMSTOCK), A., ii, 477.
- liquid-crystalline state as a general property of (v. WEIMARN), A., ii, 90, 263, 1023.
- Measuring vessel** and **pipette**, rapid (SCHUBERT), A., ii, 424.
- Meat**, creatine and creatinine in (EMMETT and GRINDLEY), A., ii, 53.
- digestion and absorption of, in the intestine (LONDON and SULIMA), A., ii, 870.
- cured, nitrates in (RICHARDSON), A., ii, 208.
- Meat extracts**, composition of (MICKO), A., ii, 644.
- monochloro-acids in (MICKO), A., ii, 713.
- creatine and creatinine in (EMMETT and GRINDLEY), A., ii, 53.
- Meconines** (MERMOD and SIMONIS), A., i, 342.
- 2-m-Meconyl-5-methoxyphenol** (PERKIN and ROBINSON), T., 513.
- Medical chemistry**. See under Chemistry.
- Medusæ**, action of the salts of sea-water on the rhythmic movements of (BEYER), A., ii, 969.
- Melabœai** from Sumatra, presence of *i*-dimethylinosite from the latex of (DE JONG), A., i, 952.
- Melamine**, salts of, with acid dyes (RADLBERGER), A., i, 1901.
- Melanins**, artificial, and the melanin of the cockchafer (ISHIZAKA), A., i, 280.
- Mellitic acid** *benzothexocarbonylacid*, constitution of the phthalates of (SILBERRAD, P., 209.
- rhodamines of (SILBERRAD and ROY), P., 204.
- Melting point**, relation of, to the surface of the granules of a solid substance (PAWLOFF), A., ii, 927.
- of the anilides, *p*-toluidides, and *a*-naphthalides of the normal fatty acids (ROBERTSON), T., 1033; P., 129.
- of the elements of the iron group, determination of, by a new radiation method (BERGESS), A., ii, 41.
- of metals, new method of determining the (SHILOFF and KERNATOFF), A., ii, 152.
- Melting point** of certain osazones (FISHER), A., i, 105.
- and boiling points of aromatic sulphides, selenides, and tellurides, and their halogen additive compounds (LYONS and BUSH), A., i, 417.
- Melting point curves** of binary mixtures of *o*-, *m*-, and *p*-nitroanilines (TIGLE and ROLKER), A., i, 408.
- of mixtures of *o*- and *p*-nitroanilines (TIGLE and ROLKER), A., i, 404.
- and freezing point curves of binary systems when the solid phase is a mixture (amorphous solid solution or mixed crystals) of the two components (VAN LAAR), A., ii, 808.
- ideal, of binary alloys, correction of the (MAZZOTTO), A., ii, 660.
- Melting points**, inverse (BRONSTED), A., ii, 809.
- Membranes**, permeabilities of colloidal, gold-beaters' skin, parchment paper, and porcelain (BIGELOW), A., ii, 85.
- Men**, healthy, excretion of sugar in (SCHÖNDORFF), A., ii, 311.
- Δ^{12} -**Menthadiene**. See Carvadiene.
- $\Delta^{12,p}$ -**Menthadiene**. See Origanene.
- $\Delta^{6,8,p-m}$ -**Menthadiene**. See *ac*-Carvostrene.
- Menthane**, 2,4-diamino-, and its derivatives (HARRIES and MAXIMA), A., i, 734.
- Menthazine** (KUNER), A., i, 91.
- Menthene**, thio- (FROMM and McKIL), A., i, 991.
- Δ^2 -**Menthene**, 2-amino-. See Carvylamine.
- Menthenes**, *o*-, *m*-, *i*- Δ^2 -, and Δ^{12} -, and their derivatives (WALLACH and CHURCHILL), A., i, 497.
- Δ^1 -**Menthen-4-ol**. See Terpinen-4-ol.
- Δ^1,p -**Menthen-1-ol**. See Terpinen-1-ol.
- Δ^2,m -**Menthen-8-ol**. See Dihydrocarvestrenol.
- Menthenone** (WALLACH and CHURCHILL), A., i, 497.
- Δ^1 -**Menthenone** and its semicarbazone (WALLACH and MEISTER), A., i, 812.
- Δ^1 -**Menthenone** and its semicarbazone and dibromide (WALLACH and MEISTER), A., i, 813.
- i*-**Menthoethylheptanonolide** (SCHMIDT & CO.), A., i, 667.
- Menthols**, *m*- and *p*- (WALLACH and CHURCHILL), A., i, 497.
- Menthols**, isomeric, and their acid esters (PICKARD and LITTLEBURY), P., 217.
- Menthone**, action of amyl nitrite on, in presence of sodium ethoxide (CLARKE, LIPWORTH, and WEINSTEIN), T., 36.
- p*-**Menthone**, syntheses of optically active Koltz and SCHWALZ, A., i, 97.

- Menthoneacetal** (ARBUSOFF), A., i, 555.
Menthonephenylhydrazone (BORSCHÉ, WITTE, and BOCHE), A., i, 366.
Menthyl methoxyacetate (FARBEN-FABRIKEN FORM. F. BAYER & Co.), A., i, 429.
Menthylcarbimide, reactions of (VALLÉE), A., i, 976.
Mercaptans, addition of, to unsaturated acids (POSNER and BAUMGAUTH), A., i, 21.
Mercuriammonium chlorides. See under Mercury.
Mercurous and Mercuric salts. See under Mercury.
Mercury, purification of (BETTEL), A., ii, 382.
 gradual modification of the first linear spectrum of emission of (CASTELLI), A., ii, 3.
 gaseous, dispersion of (CUTHBERTSON and METCALFE), A., ii, 545.
 specific heat of (KURBATOFF), A., ii, 807.
 recalculation of the vapour pressure of (LABY), A., ii, 1039.
 apparatus for the rapid distillation of (FLOMO), A., ii, 829.
 diffusion of metals in (SMITH), A., ii, 159.
 non-electrolytic solution of, in water and other liquids (CHRISTOFF), A., ii, 696.
 interaction of, with alloys of other metals (MALLER), A., ii, 187.
 physico-chemical considerations as to pharmacological and toxicological actions of (SABBATINI), A., ii, 718.
Mercuriammonium chlorides, ammoniacal (GAUDECHON), A., ii, 383.
Dimercuriammonium chloride and ammonium chloride, double, dissociation of, by water (GAUDECHON), A., ii, 188.
Mercury alloys (*amalgams*) (SMITH), A., ii, 88.
 conduction of electricity by (KINSKY), A., ii, 754.
 with ammonium (SMITH), A., ii, 38.
 demonstration of the formation of, by electrolysis of ammonium chloride (SCHROEDER), A., ii, 270.
 with calcium and sodium, behaviour of, as electrodes in solutions of neutral salts (BYERS), A., ii, 926.
 with zinc (VAN DEVENTER), A., ii, 591.
Mercury salts, hemolytic action of (DUNIN-BORKOWSKI), A., ii, 1049.
Mercury perchlorate, bromo- and iodo- (BORELLI), A., ii, 1039.
 thiocyano- (BORELLI), A., ii, 1040.
Mercury ammonium chromates (GRÖGER), A., ii, 691.
 iodide, condensation of, with camphor (MARSH and STRUTHERS), P., 267.
 peroxydates (v. ANTROPOFF), A., ii, 383.
Mercurous nitrite, molecular volume of (RÄY), T., 999; P., 75.
Mercuric salts with complex cations, constitution of (BORELLI), A., i, 515; ii, 1039.
 rapid estimation of, in aqueous solution (LIVERSEDGE), A., ii, 634.
Mercuric bromide or chloride, action of hydrogen phosphide on (LEMOULT), A., ii, 35.
 bromide and chloride, estimation of the halogen in (KOHN), A., ii, 892.
 chloride, ammonium chloride, and water at 30°, in equilibrium (MEERBURG), A., ii, 676.
 solutions, effect of glass and traces of organic substances on (VAN RYN), A., ii, 591.
 reactions of, with organic acids (OECHSNER DE CONINCK and DAUTHY), A., i, 392.
 additive compounds of, with aromatic nitro-compounds (MASCARELLI), A., ii, 162.
 pastilles, rapid valuation of (FIORA), A., ii, 735.
 detection of very small quantities of (KOF and HAEHN), A., ii, 69.
 estimation of, in pastilles (SAFORETTI), A., ii, 133; (RIMINI), A., ii, 433.
 ammonium chloride (*white precipitate*), reactions of, with methyl iodide (SCHMIDT and KRAUSS), A., i, 139.
 acidimetric assay of (RUPP and LEHMANN), A., ii, 70.
 iodide, two observations relating to the decomposition of (KOHN), A., ii, 696.
 action of, on ketones in alkaline solution (MARSH and STRUTHERS), P., 266.
 double salt of, with potassium iodide in organic solvents (MARSH and STRUTHERS), P., 266.
 nitrate, action of, on inorganic hydroxides (BILTZ and ZIMMERMANN), A., ii, 104.
 nitrate solution, solubility of silver chloride in (BUTTLE and HEWITT), T., 1405; P., 173.

Mercury:—

Mercuric oxide, estimation of, volumetrically (RUFF and SCHIMMER), A., ii, 1073.
 sulphide, solubility of (KNOX), A., ii, 830.

Mercuri-iodides of aluminium and thorium (DUBOIS), A., ii, 598.

Mercury organic compound, new (NARBELLI), A., ii, 715.

Mercury cyanides, complete analysis of (RUFF and LEHMANN), A., ii, 70.
 oxycyanide, acidimetric estimation of both mercury components in (RUFF), A., ii, 634.

Mercuric cyanide, preparation of (RUFF and GOY), A., i, 863.
 reactivity of (HOFFMANN and WAGNER), A., i, 113, 514.
 compounds of, with alkalis and nitric acid (HOFFMANN and WAGNER), A., i, 514.
 alkaline, action of, on halogen derivatives of acetylene and ethylene (HOFFMANN and KIRMSEUTHER), A., i, 115.
 compound of, with pyridine (SCHROEDER), A., i, 252.
 zinc cyanide, formula of (DUNSTAN), P., 135.
 oxycyanide (RUFF and GOY), A., i, 770.

Mercury dialkyls and sodium, action of a mixture of, on aldehydes, ketones, esters, and carbon dioxide (SCHROEDER), A., i, 881.

diethyl, action of, on mercury fulminate (GRIGOROWITSCH), A., i, 251.

phenyl, reaction of, with zirconium tetrachloride (PETERS), A., i, 1032.

Cyanomercury salts (BORELLI), A., i, 515.

Mercuri-fatty acids, α -hydroxy-, synthesis of (SCHRAUTH and SCHÖLLER), A., i, 617.

Mercuriacetic anhydride, hydroxy-, and its salts, synthesis of (SCHRAUTH and SCHÖLLER), A., i, 617.

Mercuridimalonic acid, methyl ester (SCHRAUTH and SCHÖLLER), A., i, 617.

Mercury, estimation of, by reduction with hydrogen peroxide (KOLB and FELDHOFFEN), A., ii, 69.
 vapour, new method of estimating, in air (MENNELL), A., ii, 433.
 estimation of, volumetrically, by the thiocyanate, iodometric, and acidimetric processes (RUFF), A., ii, 1073.

Mercury, estimation of, volumetrically in its ores (MÜLLER), A., ii, 227.

Mercury measuring tubes. See *ANALYSIS*.

Merotropic compounds, phenylglycidide as reagent for determining the constitution of (MICHAEL and COBB), A., i, 947.

Merotropy and desmotropy (MICHAEL and SMITH), A., i, 947.
 (MICHAEL and COBB), A., i, 947.

Mesaconic acid, phenyl esters, and their derivatives (CLARKE), A., i, 335.

Mesityl oxide (*methyl isobutyl ketone*), isopropylideneacetone, anti-quinone, one derivatives from (KOUS), A., i, 829.

Mesitylenesulphinic acid, preparation of (KNOVENAGEL and KENSER), A., i, 971.

Mesitylenesulphinic anhydride, preparation of (KNOVENAGEL and POLACK), A., i, 971.

Mesitylentrinaldehyde (*1,3,5-trimethylalbacene*) and its hexaacetate (BIGLER), A., i, 424.

Mesityloxidoxalic acid, methyl ester, polymeric of, rotatory polarisation in crystals of (SOMMERFELD), A., ii, 339.

Mesochydry, so-called (AVERES), A., i, 228.

Mesolite from Montresta, Sardinia (PERACANI), A., ii, 861.

Mesothorium (HAHN), A., ii, 557.

short-lived intermediate product between radiothorium and (HAHN), A., ii, 454.

Mesoxalic acid, methyl ester, and some of its reactions (CURTIS and TAKOWSKI), A., i, 760.

Metabolism, effect of castration on (McCRUDEN), A., ii, 495.

action of intestinal astringents on (STRO), A., ii, 1050.

influence of magnesium sulphate on (STEEL), A., ii, 767.

changes in, due to the action of strontium (BURGASSI), A., ii, 105.

in alcaptonuria (ADDERHALDEN and BLOCH), A., ii, 54.

in a case of coma under renal feeding (LADLAW and RYFFEL), A., ii, 311.

animal, the importance of so-called plant-analides in (HENDERSON and HANSEN), A., ii, 119.

of calcium (PATTERSON), A., ii, 205.

of calcium, magnesium, and phosphorus during incubation (WELLMANN), A., ii, 396.

in relation to rickets (ARON), A., ii, 771.

- Metabolism**, creatinine (LEFMANN), A., ii, 1050.
 gaseous, changes in, after exclusion of hepatic circulation (SCAFFIDI), A., ii, 1051.
 in uremic dogs (LA FRANCA), A., ii, 303.
 inorganic and nitrogenous, in pancreatic diabetes in dogs (FALTA and WHITNEY), A., ii, 218.
 intermediary, influence of thyroidectomy and thyroid feeding on (UNDERHILL and SAIKI), A., i, 962.
 of the dog, influence of hydrazine on (UNDERHILL and KLEINER), A., ii, 214.
 mineral, in healthy and rachitic children (CRONHEIM and MÜLLER), A., ii, 405.
 nitrogenous parenteral (MICHAELIS and RONA), A., ii, 206.
 nuclein, in a dog with an Eck's fistula (SWEET and LEVENE), A., ii, 119.
 ferments of (SCHITTENHELM), A., ii, 960.
 phosphorus, in man (SHERMAN), A., ii, 405.
 of proteins, immunity, and hypersensitiveness (FRIEDEMANN and ISAAC), A., ii, 606.
 and muscular activity (SHAFFER), A., ii, 961.
 influence of amides on (FRIEDLÄNDER), A., ii, 514.
 influence of carbohydrates on (MARTIN), A., ii, 306.
 influence of internal hemorrhage on (WHINGARTEN and CROHN), A., ii, 710.
 influence of potassium cyanide on (RICHARDS and WALLACE), A., ii, 214.
 in cystinuria (WOLF, SHAFFER, ÖSTERBERG, and SOMOGYI), A., ii, 717.
 in poisoning by bromobenzene (MARRIOTT and WOLF), A., ii, 123.
 respiratory. See Respiratory metabolism.
 starvation (HALPERN), A., ii, 1051.
 uric acid, the importance of allantoin in (WIECHOWSKI), A., ii, 119.
Metachlorophyllin. See Chlorophyll, so-called crystallisable.
Metal ammonia compounds, complex (WERNER), A., ii, 42; (WERNER, BINTSCHEDLER, and GRÜN), A., ii, 43; (SAND and BÖCKMAN), A., ii, 44.
 See also under the separate Metals.
- Metallic carbonates and hydroxides**, free energy changes attending the formation of certain (JOHNSTON), A., ii, 812.
 dissociation pressures of some (JOHNSTON), A., ii, 358; (SCHOTTKY), A., ii, 1016.
 See also Carbonates.
 cyanides, reactions of, with phenylhydrazine (STRUTHERS), P., 179.
 See also Cyanides.
 deposits, use of, in metallography (GIOLITTI), A., ii, 945.
 films, transparent (TURNER), A., ii, 1034.
 halogen salts, oxides, and sulphides, action of metallic calcium and calcium hydride on (PERKIN and PRATT), A., ii, 379.
 See also Perhalogen salts.
 hydroxides and carbonates, free energy changes attending the formation of certain (JOHNSTON), A., ii, 812.
 dissociation pressures of some (JOHNSTON), A., ii, 358; (SCHOTTKY), A., ii, 1016.
 amphoteric (WOOD), T., 411; P., 15.
 preparation of hydrosols of, from hydrogels (MÜLLER), A., ii, 286.
 action of, on solutions of ammonium thiocyanate (GROSSMANN), A., i, 512.
 action of silver nitrate and of mercuric nitrate on (BILTZ and ZIMMERMANN), A., ii, 104.
 ions. See Ions under Electrochemistry.
 nitrides, formation of (HENDERSON and GALLETLV), A., ii, 485.
 and their magnetic properties (SHUKOFF), A., ii, 484; (WEDEKIND and VEIT), A., ii, 1041.
 See also Nitrides.
 oxides, emission of electrons by (JENTSCH), A., ii, 652.
 reduction of, by carbon, in presence of metallic iron and other substances (GREENWOOD), T., 1496; P., 189.
 autoradiation of some, in the vacuum of the cathode light (DAMM and KRAFFT), A., ii, 39.
 action of, on primary alcohols (SABATIER and MAILHE), A., i, 594, 715.
 refractory, reduction of, by carbon (GREENWOOD), T., 1493; P., 188.
 See also Oxides.
 radiation. See under Photochemistry.
 radicals, oxygenated, magnetic properties of (PASCAL), A., ii, 1013.

- Metallic salts**, specific heat of, between the temperature of liquid air and room temperature (NORDMEYER), A., ii, 353.
- equilibrium between metals and solutions of (ROSE), A., ii, 569.
- action of arsine on solutions of some (RECKLEBEN, LOCKEMANN, and ECKARDT), A., ii, 36.
- as peroxylases (WOLFF), A., i, 137, 490; ii, 573, 1022; (WOLFF and DE STOEKLIN), A., i, 740.
- reactions of, with phenylhydrazine (STRUTHERS), P., 179.
- cyclic complex, new class of (GRÜN and BOCKISCH), A., i, 934.
- fused, influence of temperature and of the state of aggregation on the absorption spectra of (RETSCHINSKY), A., ii, 910.
- molecular state of (LORENZ, KAUFER, and LIEBMANN), A., ii, 1023.
- conductivity of (ARNDT and GESSLER), A., ii, 923.
- viscosity of, at high temperatures (FAWSTIT), T., 1302; P., 146.
- of the heavy metals, change of free energy accompanying the formation of (LORENZ and FOX), A., ii, 656.
- densities of some, and their mixtures at various temperatures (LORENZ, FREI, and JANS), A., ii, 156.
- density and equivalent conductivity of (ARNDT and GESSLER), A., ii, 923.
- normal, action of (HÖBER), A., ii, 28.
- See also Salts.
- silicates (JORDIS), A., ii, 103, 492; (JORDIS and HENNIS), A., ii, 291.
- preparation of, by wet methods (JORDIS), A., ii, 291; (ULFEERS), A., ii, 592.
- See also Alkali-silicates and Silicates.
- solutions, aqueous, surface tension of dilute (HETZWEILLER), A., ii, 356.
- sulphates, compounds of, with antimony sulphate (GUTMANN), A., ii, 503.
- See also Sulphates.
- sulphides, liquefaction and sublimation of certain (BLITZ), A., ii, 845.
- and their mixtures, freezing-point diagrams of (FRIEDRICH and SCHÖN), A., ii, 281.
- volatility of some (DAMM and KEAFF), A., ii, 39.
- Metallic sulphides and sodium peroxide**, use of, for decomposing mineral and industrial products (WAGNER and SCHOLZ), A., ii, 732.
- See also Sulphides under Sulphides and Polysulphides.
- vapours, abnormal dispersion of (SCHÖN), A., ii, 334.

- Metalloids**, the metallic form of (MOSER), A., ii, 98.
- ultimate rays of the (DE GRAMONT), A., i, 645.
- Metals**, resolution of the spectral lines of some, in a magnetic field (MOSER), A., ii, 138.
- photochemical action of, in the dark (LÉGERDY), A., ii, 112.
- radioactivity of ordinary, and the penetrating radiation from the earth (McLENNAN), A., ii, 648.
- photographic action of (SARASIN), A., ii, 789.
- galvanic self-induction of (VAN DE VENTER and VAN LEMMEL), A., ii, 12, 558.
- difference of potential and the stability of the alternating current between (GAY and BRON), A., ii, 561, 755.
- electrical resistance and expansion of (BRONIEWSKI), A., ii, 147.
- conduction of electricity by (KISSKY), A., ii, 754.
- cathodic pulverisation of, in associated gases (KOHLSCHÜTTER and GOLDSCHMIDT), A., ii, 457; (FISCHER and HÄHNEL), A., ii, 553, 890, 925; (KOHLSCHÜTTER), A., ii, 799, 800, 925; (WALTER), A., ii, 925.
- material effects accompanying the passage of an electric current through solutions of, in liquid ammonia (KRAUS), A., ii, 835.
- certain phenomena exhibited by, as a Noctist glower (MENDENHALL and INGERSOLL), A., ii, 151.
- new method of determining the melting-point of (SCHUCKOFF and KREATOFF), A., ii, 153.
- relation between compressibility, thermal expansion, atomic heat, and atomic volume of (GRUNSEIS), A., ii, 563.
- thermal expansion and specific heat of (GRUNSEIS), A., ii, 563.
- passive state of (BAYER), A., ii, 1026.
- viscosity of (FAWSTIT), T., 1306; P., 146.
- viscosity of certain, and its variation with temperature (GAY and MINZ), A., ii, 930.

- Tetals**, diffusion of, in mercury (SMITH), A., ii, 159.
 equation of condition for; a correction (GRÜNFELDER), A., ii, 563; (THIESEN), A., ii, 659, 808.
 application of the kinetic theory to (REVOULT), A., ii, 934.
 and solutions of metallic salts, equilibrium between (BOSE), A., ii, 569.
 solutions of, in non-metallic solvents (KRAUS), A., ii, 486, 834, 835.
 hardness of solid solutions of (KURNAKOFF and SCHEMITSCHUSCHNY), A., ii, 932.
 finely divided, action of, on nitrogen compounds (PADOA and CHIAVES), A., i, 104.
 catalytic action of, on compounds containing nitrogen (PADOA and SCAGLIARINI), A., i, 828.
 action of, on water (VAN RYN), A., ii, 190.
 behaviour of, when heated in ammonia (HENDERSON and GILLETLY), A., ii, 455.
 action of ammonium persulphate on (TURRENTINE), A., ii, 104; (LEVI, MIGLIORINI, and ERCOLINI), A., ii, 581.
 action of halogens on (SCHUYTEN), A., ii, 31, 683.
 action of nitric acid on (STANSBIE), A., ii, 497.
 action of oxygen on (JORDIS and ROSENHAUPT), A., ii, 172.
 action of, on aqueous solutions of the persulphates (TURRENTINE), A., ii, 104; (LEVI, MIGLIORINI, and ERCOLINI), A., ii, 581.
 extraction of gases contained in (BOUDOUARD), A., ii, 109.
 and ammonia, formation of compounds between (KRAUS), A., ii, 486.
 the rapid electro-analytical deposition and separation of (SAND), T., 1572; P., 189.
 estimation of, in organic substances (ROTHE), A., ii, 132.
 qualitative and quantitative separation of (POZZI-ESCOFF), A., ii, 892.
 which are precipitated by hydrogen sulphide, separation of the (BOLLENBACH), A., ii, 985.
- Metals of the ammonium sulphide group**, separation of (EBLER), A., ii, 987.
- Metanil yellow** as a selective indicator (LINDER), A., ii, 627.
- Metasaccharin**, C_5 sugars from (KILIANI), A., i, 135.
- Metastannic acid**. See under Tin.
- Meteloidine** from *Datura Meteloides* and its additive salts (PYMAN and REYNOLDS), T., 2077; P., 234.
- Meteoric chromites** (TASSIN), A., ii, 956.
- iron, El Inca. (RINNE and BOEKE), A., ii, 303.
- Meteorite**, Ainsworth (HOWELL), A., ii, 204.

- Methylhydrazine, novel derivative, constitution of (MORRIS and HADAMCK), A., i, 1620.
- α -Methyl- β -hydrindone, acyano-, and its phenylhydrazones (MOORE and THORPE), T., 181; P., 13.
- 1-Methylhydrothymine, 5-bromo-3-hydroxy-, and 5-nitro-3-hydroxy- (JOHNSON and CLAPP), A., i, 865.
- 3-Methylhydrothymine, 5-nitro-3-hydroxy-, (JOHNSON and CLAPP), A., i, 865.
- 3-Methyl-1:7-3:5-dihydroxydihydroxanthine (FARBENFABRIK AG., F. BAYER & CO.), A., i, 175.
- 5-Methyl-4-aminazonolone, amides, and its salts and methyl derivatives (TAFEL and MAYER), A., i, 74.
- 2-Methylimino-4:6-dimethylhydro-pyrimidine (MAJIMA and KAWASAKI), A., i, 224.
- β -Methyliminodipropaldehyde, methyl ester of (WHEELER and JOHNSON), A., i, 46.
- Methylimino groups, formation of (HILDEG.), A., i, 638.

- Methylimino groups**, quantitative estimation of (KIRPAL), A., ii, 436.
5. **Methylimino-1:2:3-triphenylcyclohexan-1-ol-4-carboxylic acid**, ethyl ester (RARE and EHRENSTEIN), A., i, 553.
- α. **Methylin**. See Glyceryl monomethyl ether.
7. **Methylindazole** and its nitroso-derivative, and the action of copper powder on (JACOBSON and HUBER), A., i, 299.
3. **Methylindole** (*scatole*), occurrence of, in the human intestine (HERTER), A., ii, 211.
1. **Methylindoline** (CARRASCO), A., i, 913.
- Methyl-*β*-α-iodopropionyl-L-tryptophan** (ABDERHALDEN and BAUMANN), A., i, 932.
- Methyl-*γ*-ionone hydrate**, preparation of (COULIN), A., i, 1000.
- Methyliridic acid**. See 3:4:5-Trimethoxyphenylacetic acid.
- α. **Methylisatin**, preparation of, and its oxime and phenylhydrazone (BAUER), A., i, 695.
4. **Methylisatin**, melting point of (BAUER), A., i, 208.
- Methyl-α-ketol α-methyladipate** and α-methyl-*β*-isopropyladipate and their dimeric carbazones (BOUVEAULT and LOQUIN), A., i, 173.
- Methylmalonic acid**, *β*-bromo, ethyl ester, preparation and reduction of (SIMONSEN), T., 1783.
- α. **Methylmesonine**, bromo- (MERMOD and SIMONIS), A., i, 343.
- Methylmenthadiene** (RUPE and EMMERICH), A., i, 433.
3. **Methyl- $\Delta^{2(89)}$ -menthadiene** (RUPE and EBERT), A., i, 663.
3. **Methyl- $\Delta^{4(8)}$ -menthadiene** (RUPE and EMMERICH), A., i, 556.
2. **Methylmenthane**, 2:8-dihydroxy- (RUPE and EMMERICH), A., i, 433.
- Methylmenthatriene** (RUPE and EMMERICH), A., i, 433.
3. **Methyl- $\Delta^{8(9)}$ -menthene**, 3-chloro- (RUPE and EBERT), A., i, 663.
- Methylmenthone** (ARBUSOFF), A., i, 555.
- 1:2. **Methylnaphthaquinotrole**, 3-*mono*- and 3:4-*di*-chloro- (FRIES and HEMPELMANN), A., i, 731.
1. **Methyl-2-naphthaquinol**, 3-*mono*- and 3:4-*di*-chloro-, and their acetates (FRIES and HEMPELMANN), A., i, 731.
- 3:4-*dichloro*-, and its methoxy-derivative (FRIES and HEMPELMANN), A., i, 730.
- N. **Methylnaphthaquinoxalone** (FISCHER and SCHINDER), A., i, 222.
1. **Methyl- β -naphthol**, keto-chlorides of, and their relation to β -naphthaquinols and 3-*mono*- and 3:4-*di*-chloro-, and their acetates (FRIES and HEMPELMANN), A., i, 730.
1. **Methylnitroamino-3:5-dimethoxybenzene**, 2:6-*dinitro*- (BLANKSMA), A., i, 979.
1. **Methyldicyclo-[1:3:3]-nonan-5-ol**, 7-amino-, isomeric (RABE and EHRENSTEIN), A., i, 553.
- Methyldicyclononanolone** and its oximes and their amines (RABE and JAHR), A., i, 553.
- N. **Methylnorpapaverinium derivatives** (DECKER, DUNANT, and GIRARD), A., i, 205.
7. **Methyl- $\Delta^{8(8)}$ -octadiene** and its dihydrobromide and tetrabromide (REIF), A., i, 847.
1. **Methyldicyclo-2:2:2-octane** and 7-amino-, and its picrate (SEMMER and BARTELT), A., i, 38.
1. **Methyldicyclo-2:2:2-octan-7-ol** and its acetate and chloride (SEMMER and BARTELT), A., i, 38.
- N. **Methylol compounds of acid amides** (EINHORN, FEIBELMANN, GÖTTLER, HAMBURGER, and SPRONGERTS), A., i, 608.
- Methylolcarbamide** (EINHORN and HAMBURGER), A., i, 142.
- Methyloleanol** and its acetyl derivative (POWER and TUTIN), T., 899; P., 117.
- Methyl-orange**, isomerism of (HANTZSCH and HILSCHER), A., i, 469.
- α. **Methyl-α-oxalosuccinic acid**, ethylester (BLAISE and GAULT), A., i, 714.
5. **Methylisoxoxazole** and its 3:4-dicarbonylic acid and its salts and ethyl ester (SCHMIDT and WIDMANN), A., i, 457.
3. **Methylisoxoxazoline** (MAIRE), A., i, 290.
1. **Methylcyclopentane-2-carboxylic acid**, 5-bromo-, and its ethyl ester, and 1:5- and 4:5-*di*bromo- (HAWORTH and PERKIN), T., 584.
7. **Methyl- $\delta\delta$ -pentandureide** (DEHAAN), A., i, 578.
2. **Methylcyclopentanol-3-carboxylic acid** (HAWORTH and PERKIN), T., 584.
- β . **Methylpentan-3-ol-5-one**. See Diacetone alcohol.
- Methylcyclopentan-4-one-3-acetic acid** and its methyl ester, and their semicarbazones (BLANC), A., i, 21.
1. **Methylcyclopentan-2-one-1-carboxylic acid**, methyl ester, and its semicarbazone (BOUVEAULT and LOQUIN), A., i, 173.

- 1-Methylcyclopentan-2-one-3-carboxylic acid, esters, and their semicarbazones (BOUYEAULT and LOCQUIN), A., i, 172.
- Methylcyclopentan-4-one-3-carboxylic acid, methyl ester, and the reaction of the sodium derivative with ethyl bromoacetate (BLANC), A., i, 20.
- 2-Methylcyclopentanone-3-carboxylic acid and its ethyl ester, oxime, and semicarbazone, synthesis of (HAWORTH and PERKIN), T., 579.
- 2-Methylcyclopentanone-2,3-dicarboxylic acid, ethyl ester, and its hydrolysis (HAWORTH and PERKIN), T., 579.
- 2-Methylcyclopentanone-3,5-dicarboxylic acid, ethyl ester (HAWORTH and PERKIN), T., 582.
- 1-Methyl- Δ^1 - and - Δ^2 -pentene-2-carboxylic acids, formation and separation of, and oxidation of, and their ethyl esters (HAWORTH and PERKIN), T., 585.
- ethyl esters, action of magnesium methyl iodide on (HAWORTH and PERKIN), T., 593.
- 1-Methyl- Δ^1 -4-*cis*-pentene methyl ketone and its semicarbazone (HARDING, HAWORTH, and PERKIN), T., 1999.
- 7-Methyl- Δ^1 -penten-8-ol and its acetate (ABELMANN), A., i, 2.
- 2-Methyl-1,2-phenonaphthacarbazole-*N*-sulphonic acid, sodium salt (BRUCHER and SEYDER), A., i, 455.
- 4-Methylphenyldimethylcarbinol, 2-hydroxy-*hydrocarbyl* (FRIES and FICKENWIRTH), A., i, 824.
- 5-Methylphenyldimethylcarbinol, 2-hydroxy- (FRIES and FICKENWIRTH), A., i, 824.
- 2-Methylpiperidine and water, mutual solubility of (FLASCHNER and MAEHWEN), T., 1999; P., 119.
- Methylpiperidiniumacetic acid, chloro-, and its ethyl ester and platinumchloride (V. BRAUN), A., i, 608.
- N*-Methylproline. See Hydroxy acid.
- 1-Methyl 2-*is* propenol-*cis* pentane, 5-hydroxy- (HAWORTH and PERKIN), T., 594.
- 1-Methyl 2-*is* propenol-*cis* pentane, 1-hydroxy- (HAWORTH and PERKIN), T., 593.
- 1-Methyl 2-*is* propenol- Δ^1 -*cis* pentene (HAWORTH and PERKIN), T., 597.
- 1-Methyl 2-*is* propenol- and propenyl- Δ^1 -*cis* pentenes (HAWORTH and PERKIN), T., 595.
- 1-Methyl 3-*is* propenol- and propenyl- Δ^1 pentenes (HAWORTH and PERKIN), T., 592.
- α -Methyl- α' -isopropyladipic acid, 5-hydroxy-, synthesis of (WATSON and MEISTER), A., i, 812.
- α -Methyl- δ -isopropyladipic acid and its ethyl ester (BOUYEAULT and LOCQUIN), A., i, 173.
- 3-Methyl-6-isopropylazobenzene, 2,4,6-trinitro- (BORSCHÉ), A., i, 367.
- 4-Methyl-1-isopropylcarbazole and its picrate (BORSCHÉ, WITTE, and BIEBER), A., i, 367.

estimation of, in steel (BLAIR), A., ii, 900.
- Molybdic acid.** See under Molybdenum.
- Monazite sand, chemical constitution of a North American** (TSCHERNIK), A., ii, 302.
- Montmorillonite, ratio of alumina and silica in** (STREMMER), A., ii, 1041.
- Mordant dyes, theory of** (WERNER and THOMANN), A., i, 440; (LIEBERMANN), A., i, 411; (TSCHUGAEFF; WERNER), A., i, 669.
- Merinda citrifolia*, constituents of the root-bark of** (OESTERLE and TISZA), A., ii, 527.
- Morindanigrin and Morindadiol and its diacetyl derivative** (OESTERLE and TISZA), A., ii, 527.
- Morindin and its acetyl derivative** (PERKINS), P., 149.
and its acetate and benzoate (OESTERLE and TISZA), A., i, 36.
- Morindone trimethyl ether** (OESTERLE and TISZA), A., i, 37.
- Morphide, α -chloro, hydrolytic products of** (OFF), A., i, 362.
- Morphine** (KNORR and HORLEIN), A., i, 41, 42, 361; (KNORR and RAABE), A., i, 908.
constitution of (BACHER), A., i, 43.
action of free alkalis on (GRUBER), A., i, 204.
constipating action of (MAGNUS), A., i, 412.
alkyl bromides, preparation of (RIEDEL), A., i, 452.
- γ -Morphine and its acetyl derivative and additive salts** (OFF), A., i, 362.
- α,β -Morphine and ψ -apocodine, relation between** (KNORR and RAABE), A., i, 908.
- Morphines, four isomeric, relationship of to the codines** (KNORR and HORLEIN), A., i, 42.
- Morphine diabetes.** See Diabetes.
- Morpholquinone** from phenanthrene (SUMMIT and SELL), A., i, 955.
- Mortar, micro-spectro study of** (GALLO), A., ii, 843, 844.
See also Cement.
- Moser rays.** See under Photochemistry.
- Moulds, conversion of cineol by means of** (RIPKE), A., ii, 1064.
See also Yeast.
- Mouse tumours, glycogen in** (HAMAN), A., ii, 612.
- Muconic acid, dichloro, constitution of** (RADULESCU), A., i, 604.
- Mud from the baths of Fitero Viejo, SO_2 Waters of Fitero Viejo.**
- Mulberry tree, the most favourable ratio of lime to magnesia for the Na** (KAMURA), A., ii, 126.
- Mummies, fatty acids from** (SCHROEDER), A., ii, 878.
- Muscarine, synthetical, fate of, in the organism** (FÜHNKE), A., ii, 165.
quantitative estimation of, by physiological methods (FERNEL), A., ii, 877.
- Muscle, physical chemistry of exchange of** (HÖBER), A., ii, 121.
contraction of, and respective substances (LANGLEY), A., ii, 120, 769.
temperature-coefficient of rate of con-
duction and latent period in (WAG-
LEY), A., ii, 711.
formation of lactic acid and carbo-
dioxide in (LATHAM), A., ii, 606.
of birds, action of barium chloride of
(EDMUND and ROTH), A., ii, 669.
of frog, creatine and creatinine in
(BROWN and CATTARUN), A., ii, 516.
mammalian cardiac, consumption of
dextrose by (LOCKE and ROSEN-
HEIM), A., ii, 120.
non-striated mammalian (SAKI), A.,
ii, 712.
striated, contraction of (MARTEN),
A., ii, 712.
of reptiles. See Reptiles.
- Muscle coagulation, decomposition of
blood platelets, and blood coagula-
tion** (BICKER), A., ii, 519.
- Muscle extracts** (KREMBOLD), A., i, 41
842; ii, 609.
- Muscle plasma** (MELANBY), A., ii, 712.
- Muscular activity and protein meta-
bolism** (SHAFFER), A., ii, 661.
the utilisation of sugar during (MIL-
LER), A., ii, 713.
- Muscular contraction and receptive
substances** (LANGLEY), A., ii, 574.
- Mustard oil, estimation of volume-
ally** (KUNZE), A., ii, 149.
See also Allylthiocarbamide and
Phenylthiocarbamide.
- Musts, deposition of creatine in** (MANS-
FELD), A., ii, 894.
estimation of lactic acid in (HÖBER),
A., ii, 125.

Kyrh, hecabel (v. FRIEDRICHS), A., 1, 96.

Myrrholic acid and its salts and **β -Myrrholic acid** and its silver salt (v. FRIEDRICHS), A., 1, 97.

N.

Naphtha, new dephlegmator for the fractionation of (HERR), A., ii, 232.
Bildebat, optical investigation of the (KARTSIN), A., ii, 115.
Ramamin, optical investigation of (KARTSIN), A., ii, 394.

Naphthalavonol, 3'- and 4'-hydroxy-, (v. KOSTANECKI, ENGELSOHN, and WÜRZELMANN), A., i, 359.

Naphthaldehyde, 3-bromo-4-hydroxy-, synthesis of, and its products with amines, and 4-hydroxy-, and its azine and additive compound with hydrazine sulphate (GATTERMANN), A., i, 29.

2-chloro-4-hydroxy- and 2-hydroxy-, (FRIEDLANDER), A., i, 373.
 hydroxy-, trimethylene ether of, and its derivatives (GATTERMANN), A., i, 35.

2,6- and 2,7-dihydroxy-, and their derivatives, synthesis of (GATTERMANN), A., i, 30.

Naphthaldehyde, 1-hydroxy-, and its hydrazone (FRIEDLANDER), A., i, 373.

Naphthaldehyde, 1:5-dihydroxy-, and its compound with aniline, synthesis of (GATTERMANN), A., i, 30.

Naphthalene and its derivative, absorption spectra of (BALY and TUCK), T., 1902; P., 223.

and 8-naphthol, crystals of, and of their mixtures (MILERS and ISAAC), T., 927; P., 125.

freezing-point surfaces of the system chlorobenzene, phenol, and (HIRONE), A., ii, 928.

*freezing-point curves of mixtures of phenol and (YAMAMOTO), A., ii, 928.

oxidation of (LAW and PERKIN), T., 1637; P., 195.

brazza from (v. KOSTANECKI and LANPE), A., i, 671.

homologues of (BARCELLINI and MELACINI), A., i, 775.

new method of preparing (DARZENS and ROSE), A., i, 411.

absorption spectra of the hydrocarbons isolated from the products of the action of aluminium chloride on (HOMER and PURVIS), T., 1319; P., 147.

Naphthalene styphnate, α -bromo- (GIBSON), T., 2099; P., 241.

estimation of, in coal gas and in spent oxide of iron (GAIR), A., ii, 135.

Naphthalene, amino-. See Naphthylamines.

diamino-. See Naphthylenediamine.

Naphthaleneazo- $\beta\beta$ -dinaphthylamines, α - and β - (FISCHER and STRAUS), A., i, 222.

Naphthaleneazoguaiacols, α - and β -, and the acetyl derivative of the α -compound (COLOMBANO and LEONARDI), A., i, 68.

4-Naphthaleneazo-3-methyl-5-pyrazolones, α - and β -, and their 1-benzoyl derivatives (BÉLOU and SCHAUB), A., i, 705.

β -Naphthalenezophenol and its acetyl derivative (GRANDMOUGIN and FREIMANN), A., i, 1024.

β -Naphthalene-4-azoresorcinol (ORTON and EVERATT), T., 1019.

Naphthaleneazo-. See also Naphtholazo-, and Naphthylazo-.

Naphthalenecarboxylic acid. See Naphthoic acid.

Naphthalene-3:6-disulphonic acid, 1:8-dihydroxy-. See Chromotropic acid.

Naphthalene-indole-indigotin (FRIEDLANDER), A., i, 372.

α -Naphthalenesulphinic acid, preparation of (KNOVENAGEL and KENNER), A., i, 971.

Naphthalene-6-sulphonic acid, 2:8-dihydroxy-, azo-compounds from the α -aminophenols and (CHEMISCHE FABRIK GRIESHEIM-ELEKTRO), A., i, 489.

Naphthalene-8-sulphonic acid, hydroxy-. See 1-Naphthol-8-sulphonic acid.

Naphthalenesulphonic acids, cerium salts (ERDMANN and NIESZYTKA), A., i, 621.

Naphthalene- β -sulphonylaminodi-phenyldiazonium salts (MORGAN and MICKLETHWAIT), T., 618.

Naphthalene- β -sulphonylbenzidine and β -nitroaminodiphenyl (MORGAN and MICKLETHWAIT), T., 617.

as **Naphthalene- β -sulphonylethylbenzidine and diphenyldiazonium salts** and their α - β -naphthols (MORGAN and MICKLETHWAIT), T., 620.

Naphthalene- β -sulphonylnitroethylaminodiphenyl (MORGAN and MICKLETHWAIT), T., 620.

β -Naphthalenesulphonyltryptophans (ELLINGER and FLAMAND), A., i, 378.

α -Naphthalides, anilides, and p -toluidides of normal fatty acids, melting points of (ROBERTSON), T., 1033; P., 120.

- Naphthanthraquinone and its sulphonic acid** (HILLER and SCHÜLKE), A., i, 994.
- $\alpha\beta$ -Naphthaphenazine-s- and -as- $\alpha\beta$ -naphthazines and their salts** (FISCHER and SCHINDLER), A., i, 221.
- Naphtha-phenazonium and its chloride and -phenazine and its hydrochloride, 9-hydroxy-** (KEHRMANN and BRUNEL), A., i, 550.
- Naphthaprasindone, amino-, and its acetyl derivative and salts** (KEHRMANN and SCHWARZENBACH), A., i, 297.
- Naphthaquinoline group, syntheses in the** (SIMON and MAUGUIS), A., i, 296.
- α -Naphthaquinone antimony pentachloride** (MEYER), A., i, 731.
- β -Naphthaquinone, 7-hydroxy-, azonium compounds and azines from** (KEHRMANN and BRUNEL), A., i, 579.
- Naphthaquinoxaline, formation of, and its picate** (FISCHER and RÖMER), A., i, 695.
- Naphtharesoreinol as a reagent for certain aldehyde- and keto-acids** (MANDEL and NEUBERG), A., ii, 993.
- Naphthazine, dihydroxy-, and its diacetyl derivative** (FISCHER and SCHINDLER), A., i, 221.
- Naphthazines, oxidation of, by chromic acid** (FISCHER and SCHINDLER), A., i, 221.
- $\alpha\beta$ -Naphthazines** (FISCHER and STRAUS), A., i, 222.
- β -Naphthindigotin, bromo-, preparation of** (GISELSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 695.
- Naphtho-blue, preparation and reactions of** (NOELTING and PHILIPP), A., i, 295.
- Naphthoic acid hydrazide, β -hydroxy-, and its benzylidene derivative** (FRANZES and EICHLER), A., i, 831.
- α -Naphthoic acid, 2-hydroxy-, and its ethyl ester** (LASSAR-COHN and LOWENSTEIN), A., i, 985.
- β -Naphthoic acid, bromoindino- and chloroindino-, esters** (HILPERT), A., i, 829.
- Naphthol derivatives, formation of, from papaverine and the binuclear quinones of the naphthalene series** (DIECKMANN), A., i, 806.
- β -Naphthol and naphthalene, crystals of, and of their mixtures** (MILES and ISAAC), T., 927; P., 125.
- action of methylolchloroacetamide on** (EINBOGEN), A., i, 612.
- molecular compound of, with 2:3:5-trinitro-4-acetylaminophenol** (MILLER and HAY), P., 210.
- 2-Naphthol, 1-amino-, *N*-benzoyl derivative of** (AUWERS and EISENHART), A., i, 229.
- N*- and *O*-benzoyl and -naphthyl derivatives of** (SCHINDLER and BRANDT), A., i, 726.
- 7-amino- and 7-chloro-** (FRANZES and DEIDEL), A., i, 833.
- Naphthols, reaction of, with diazo-salts** (ORTON and EVERATT), T., 1010; P., 118.
- new differential reactions of the** (VOLEY-BOUCHER), A., ii, 1114.
- azo-derivatives of** (ORTON and EVERATT), T., 1020.
- β -Naphtholazobenzene-4-arsonic acid and its sodium salts** (BARON and PYMAN, and REMFEN), T., 1297.
- α -Naphthol 3-sulphonic acid, β -naphthol, preparation of** (CASSELLA and CO.), A., i, 160.
- 1-Naphthol 8-sulphonic acid, sodium salts** (ERDMANN and NIESZYTA), A., i, 622; (ERDMANN and WIRTH), A., ii, 695.
- Naphtholsulphonic acids, 1:2- and 2:4-amino-, preparation of aryl-sulpho-derivatives of** (AKTIES-GESELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 415.
- β -Naphtholsulphonic acids, 1-amino-, preparation of diazo-derivatives of** (KALLE & CO.), A., i, 842.
- Naphthyl arsenite** (LANG, MACKAY, and GORTNER), T., 1379; P., 151.
- α -Naphthyl trimethylene ether** (GATTERMANN), A., i, 35.
- β -Naphthyl trimethylene ether and its dialdehyde** (GATTERMANN), A., i, 35.
- α -Naphthyl-acetone and -acetaldehyde, and their semicarbazones** (TIFENEAU and DAUBEL), A., i, 973.

- β -Naphthylamine, condensation of, with aldehydes and ketones** (ROHM-FUSSER), A., i, 52.
- 1-bromo- and 1-chloro-, condensation of, with methylenechloro-amine** (AND AUSTIN), T., 63.
- Naphthylamines, α - and β -, acyl derivatives. See Aceto- α - and - β -naphthylides.**
- 1- β -Naphthylaminobenzene, 4-chloro-2:5-dinitro-, preparation of** (EINMANN), A., i, 627.
- Naphthylarsinic acid, amino- and hydroxy-** (O. and R. AMER), A., i, 392.

- Naphthyl 4-arsinic acid**, 1-amino- (BENDA and KAHN), A., i, 592.
- Naphthylazooacetoacetic acids**, α - and β -, ethyl esters, benzoylhydrazones of (BLOW and SCHAUB), A., i, 705.
- Naphthylazo-**. See also Naphthaleneazo-, and Naphtholazo-.
- α -Naphthylbenzylamine** and its hydrochloride (BUSCH and LEEFHELM), A., i, 152.
- β -Naphthyl- ψ -benzylthiocarbamide**, cyano- (FROMM and WELLER), A., i, 799.
- Naphthylcarbimide**, reactions of (VALLEE), A., i, 976.
- α -Naphthylchlorosilicane** (MEIZER), A., i, 967.
- Naphthyladiconitriles**, α - and β -. (v. MEYER and SCHUMACHER), A., i, 909.
- 1,3-Naphthylenediamine**, formation of, from β -amino- α -cyano- γ -phenylpropane (BEST and THORPE), P., 253.
- 2,7-Naphthylenedihydrazine** and its dibenzylidene derivative (FRANZEN and DEIBEL), A., i, 833.
- α -Naphthylethylene** (TIFFENEAU and DAUDEL), A., i, 973.
- Naphthyl group**, migration of, in iodo- hydrius of the naphthalene series (TIFFENEAU and DAUDEL), A., i, 972.
- β -Naphthylhydrazine**, condensation of, with aldehydes and ketones (ROTHERFUSSE), A., i, 52.
- β -Naphthylhydrazine**, 7-amino-, and 7-hydroxy- and their benzylidene derivatives (FRANZEN and DEIBEL), A., i, 832.
- γ - α -Naphthylhydroxylamine**, aldoxime ethers from (SCHEIDER and RECKMANN; SCHEIDER and BRANDT), A., i, 725.
- β -Naphthylmethylaminoacetonitrile** (v. BRAUN), A., i, 628.
- 6-1- and -2-Naphthyl- β -methylglycidic acids** and their ethylesters (DARZENS), A., i, 91.
- Naphthyl methyl ketones**, α - and $\alpha\beta$ -, semicarbazones of (DARZENS), A., i, 91.
- β -Naphthyl-3-methylpyrazolone**, 7'-hydroxy- (FRANZEN and DEIBEL), A., i, 832.
- α -1- and -2-Naphthylpropaldehydes** and their semicarbazones (DARZENS), A., i, 91.
- α -1-Naphthylpropionic acid** (TIFFENEAU and DAUDEL), A., i, 973.
- Naphthylpropylenes**, α - and β -. (TIFFENEAU and DAUDEL), A., i, 972.
- β -Naphthyl propyl ketone**, crystallography of (BARGELLINI and MELACINI), A., i, 775.
- β -Naphthylsemicarbazide**, 7-hydroxy- (FRANZEN and DEIBEL), A., i, 832.
- α -Naphthylsilico-acid** and the ester of the ortho-acid (MEIZER), A., i, 967.
- α -Naphthylthioacetic acid**, preparation of (KALLE & Co.), A., i, 605.
- β -Naphthyl-thiuret** hydrochloride and - α -thiobiuret (FROMM and WELLER), A., i, 793.
- β - α -Naphthylxyloside**, synthesis of (RYAN and EBRILL), A., i, 716.
- Narcosis**, physical chemistry of (HÖBER), A., ii, 121.
- Narcotine derivatives**, preparation of (KNOLL & Co.), A., i, 285.
- Narcotinesulphonic acid** (KNOLL & Co.), A., i, 285.
- Natrochalcite**, a new mineral from Chile (PALACHE and WARREN), A., ii, 1047.
- Natural waters**. See under Water.
- Neodymium**, anomalous magnetic rotatory dispersion of (WOOD), A., ii, 244.
- Neodymium salts**, borax bead test for (MILBAUER), A., ii, 70.
- Neodymium fluoride** (POPOVICI), A., ii, 283.
- Neo-erbium** (HOFMANN and BUGGE), A., ii, 159.
- Neo-erbium oxide**, spectrum of, and Kirchhoff's law (HOFMANN and BUGGE), A., ii, 1002.
- Neon**, helium, xenon, and krypton, percentage of, in the atmosphere (RAMSAY), A., ii, 688.
- Neosine**, constitution of (ACKERMANN and KUTSCHER), A., i, 675.
- Neottine**, a triamino-phosphatide (FRANKEL; BOLAFFIO), A., i, 377.
- Neo-ytterbium** (DERRAIN), A., ii, 253, 519.
- Nepheline**, composition of (MOROZEWICZ), A., ii, 201.
- Nepheline-syenite** from Los Islands, sodium fluoride in (LACROIX), A., ii, 200.
- Nernst-glowers**, certain phenomena exhibited by small particles of metals on a (MENDENHALL and INGERSOLL), A., ii, 151.
- Nerve**, temperature-coefficient of rate of conduction in (LUCAS), A., ii, 711.
- action of certain narcotics on (BETHE), A., ii, 1059.
- great splanchnic, influence of stimulation of the, when the liver is deprived of its blood supply (MACLEOD and RUI), A., ii, 770.
- glycogenolytic fibres in the (MACLEOD), A., ii, 770.
- Nerve conduction**, temperature-coefficient of the velocity of (SNYDER), A., ii, 608.

- Nerve degeneration**, the chemical test for diseases due to (BAUER), A., ii, 717.
 endings, action of curare and eserine on (EDMUND and ROTH), A., ii, 966.
 fibres, action of aconitine on (WALLER), A., ii, 55.
 medullated, Weigert's method of staining (SMITH, MAIR, and THORPE), A., ii, 966.
- Nerves**, chemical and physical properties of (ALCOCK and LYNCH), A., ii, 51.
 autonomic, action of nitrites and atropine on (FRÖHLICH and LOEWI), A., ii, 711.
 peripheral, chemical composition of (FALK), A., ii, 965.
 of the frog. See Frog.
- Nervous system**, sulphur compounds of the (KOCH), A., ii, 52.
- Neurokeratin** (ARGIIS), A., i, 70.
- Neuronal**, constitution of (MANNICH and ZERNIK), A., i, 399.
- Neutral salt action**, experimental and thermodynamic researches on (V. SZYSZKOWSKI), A., ii, 761.
- Neutrality regulation** in the animal organism, theory of (HENDERSON), A., ii, 467.
- New Victoria Blue**. See Victoria Blue R.
- Niaouli oil** (SCHIMMEL & Co.), A., i, 666.
- Nickel**, change of density and specific heat of, after treatment, and the dependence of the specific heat on the temperature (SCHLETT), A., ii, 563.
 passivity of (FREDENHAGEN), A., ii, 679.
 cobalt, and iron, experiments on the passivity of (BYERS), A., ii, 1026.
 equilibrium in the system, bismuth and (PORTEVIN), A., ii, 45.
 and hydrogen, relationships between (MAYER and ALTMAYER), A., ii, 950.
 and copper solutions, colorimetric comparison of (MILBAUER), A., ii, 71.
- Nickel alloys** with aluminium (GWYER), A., ii, 285.
 with bismuth, cadmium, chromium, lead, magnesium, thallium, tin, and zinc (VOSS), A., ii, 194.
 with copper and zinc, constitution of (TAFEL), A., ii, 846.
 with thorium (CHAUVENET), A., ii, 858.
 with zinc (TAFEL), A., ii, 105, 846.
- Nickel compounds** with phosphorus (KONSTANTINOFF), A., ii, 855.
- Nickel salts**, abnormal behaviour of, hydrolysis (DENHAM), A., ii, 359.
- Nickel arsenides** (VIGOUROUX), A., ii, 855.
 chloride, free energy of (THOMPSON and SAGE), A., ii, 468.
 ammonium chromates (GLOER), A., ii, 691.
 molybdate and cobalt molybdate (Pozzi-Escot), A., ii, 1042.
- Nickelous oxide**, dissociation process of (FOOTE and SMITH), A., ii, 547.
- Nickel oxide**, reduction and oxidation of, under ordinary and high pressures (IPATIEFF), A., ii, 594.
 peroxide electrodes. See Electrodes under Electrochemistry.
 sulphide, compounds of, with barium sulphide and potassium sulphide I. and L. (BELLUCCI), A., ii, 199.
 sulphides, freezing-point curve of the (BORNEMANN), A., ii, 292.
- Nickel pyridine thiocyanate**, action of iodine on (PFEIFFER and THOMAS), A., i, 614.
- Nickel**, detection of (Pozzi-Escot), A., ii, 229; (GROSSMANN and SCHÜCK), A., ii, 230, 899.
 detection of, as double nickel ammonium molybdate (Pozzi-Escot), A., ii, 133.
 and cobalt, simultaneous qualitative test for (GROSSMANN and BORNEMANN), A., ii, 635.
 and cobalt, detection and estimation of (Pozzi-Escot), A., ii, 899.
 detection of, in ores and nickel-ores (GROSSMANN), A., ii, 434.
 detection and estimation of, in presence of cobalt, iron, and manganese (Pozzi-Escot), A., ii, 229.
 estimation of (Pozzi-Escot), A., ii, 635.
 estimation of, volumetrically (CANTONI and ROSENSTEIN), A., ii, 230.
 Brunck's dimethylglyoxime process for the estimation of (GROSSMANN and SCHÜCK), A., ii, 71.
 rapid estimation of, in presence of all elements of groups 4, 5, and 6 (Pozzi-Escot), A., ii, 655.
 estimation of, in presence of a large excess of cobalt (Pozzi-Escot), A., ii, 324.
 and cobalt, colorimetric estimation of, in presence of each other (CHALLINOR), A., ii, 988.
 estimation of, in steel (BLAIR), A., ii, 900.
 and chromium, estimation of, in steel (CAMPBELL and ARTHUR), A., ii, 779.

- Nickel** and cobalt, estimation and separation of (POZZI-ESCOT), A., ii, 229, 539, 540.
 electrolytic estimation of, in nitrate solutions and its separation from copper (THIEL), A., ii, 539.
 and cobalt, separation of iron from (LABY), A., ii, 988.
 electrolytic separation of zinc and (FOERSTER and TREADWELL; FISCHER), A., ii, 324.
Nickel matte, constitution of (BORNE-MANN), A., ii, 292.
Nickelous oxide. See under Nickel.
Nickel steel, gases occluded in a special (BELLOC), A., ii, 852.
 detection of nickel in (GROSSMANN), A., ii, 434.
Nicotinamide, 6-chloro- (MILLS and WIDDOWS), T., 1381; P., 174.
Nicotinic acid hydriodide (TURNAU), A., i, 912.
Nicotinic acid, hydroxy-, ethyl ester, azide, and hydrazide of (MILLS and WIDDOWS), T., 1381; P., 174.
Nicotinic acid hydriodide (TURNAU), A., i, 912.
Nigella, alkaloids of the species of (KELLER), A., i, 283.
Niobium. See Columbium.
Nipponium and its oxides, chloride, and hydroxide, from thorianite (OGAWA), A., ii, 952, 953.
Nitrates. See under Nitrogen.

Nitrilo-acids, synthesis of (STADNIKOFF), A., i, 251.
Nitrites. See under Nitrogen.
Nitroamines, aromatic, and allied substances, transformation of, and its relation to substitution in benzene derivatives (BRITISH ASSOCIATION REPORTS), A., i, 332.
o-**Nitroamines**, preparation of, from the corresponding phenols (ULLMANN and NÁDAI), A., i, 525.
o-**Nitroamino-derivatives**, aromatic, preparation of (ULLMANN), A., i, 626.
Nitro-compounds, relation between the absorption spectra and chemical constitution of (BAILY and DESCH), T., 1747; P., 173.
 and nitroso-compounds, aromatic, question of the miscibility and form-analogy in (JÄGER), A., i, 147.
 action of hydrazine hydrate on (CURTIUS and MAYER), A., i, 53.
 action of sodium hyposulphite on (SEYEWETZ and NOEL), A., i, 408.
 reduction of, with zinc dust and acetic acid (HELLER and SOURDIS), A., i, 208, 913; (HELLER and SÖLLING), A., i, 867.
 aromatic, reduction of, to azoxy-compounds in acid solution (FLÜRSCHHEIM and SIMON), T., 1463.
 reduction of, by sodium sulphide (BLANKSMA), A., i, 875.
 reduction of, by Zinin's method (WILLSTÄTTER and KUBLI), A., i, 522.
 additive compounds of, with mercuric chloride (MASCARELLI), A., ii, 162.
 isomeric, spectroscopical investigation of, in the ultra-violet (HEDLEY), A., i, 382.
 organic, formation of, by the action of ammoniacal silver oxide solution (BRUNNER and MELLER), A., i, 176.
 See also Polynitro-compounds and under the parent Substance.
Nitrogen, atomic weight of (LEDUC), A., ii, 271.
 application of the method of limiting densities to the atomic weight of (GUYE), A., ii, 17.

Nitrogen and hydrogen, chemical action of radium emanation on (CAMERON and RAMSAY), T., 984; P., 132.

thermochemistry of (THOMLINSON), A., ii, 1016.

asymmetric (E. and O. WEDEKIND), A., i, 258; (E. and O. WEDEKIND and PASCHKE), A., i, 334.

effect of ether anesthesia on the excretion of (HAWK), A., ii, 410.

influence of potassium cyanide on the excretion of, in dogs (WELKER), A., ii, 411.

ammoniacal, movement of, in nature (ERRENBERG), A., ii, 60.

in soil. See under Manurial experiments and Soil.

organic compounds of phosphorus, sulphur, and, in vegetables (STRUTZER), A., ii, 124.

combination of, with calcium carbide (POLLACCT), A., ii, 836.

Nitrogen oxides, formation of, in the ozone generator (MANCHOT), A., ii, 272.

analysis of, by means of their ultra-red absorption spectra (WARBURG and LEITHAUSER), A., ii, 175.

dioxide (*nitric oxide*), formation of, in high tension arcs (HABER and KOENIG), A., ii, 34, 940.

gaseous, refractive index of (CUTHBERTSON and METCALFE), A., ii, 545.

solubility of, in aqueous solutions of ferrous sulphate, nickel sulphate, cobalt sulphate, and manganese chloride (USHER), A., ii, 487.

and oxygen, interaction of (MANDL and RUSS), A., ii, 272; (HOLWECH), A., ii, 941.

peroxide or tetroxide, preparation of (WINANS), A., ii, 487.

ozone, and hydrogen peroxide, formation of, in reactions in air which develop high temperatures (KEISER and McMASTER), A., ii, 223.

ozone, and hydrogen peroxide, detection of, in gaseous mixtures (KEISER and McMASTER), A., ii, 222.

Nitric acid and nitrous acid, preparation of (FOERSTER and KOCH), A., ii, 911.

production of, during electric discharge in air (MEYER), A., ii, 487.

interaction of, with copper in presence of metallic nitrates (KENNIE, HUGGIN, and COOKE), T., 1162; P., 141.

Nitrogen:—

Nitric acid, action of, on metals (STANSBIE), A., ii, 497.

compound of, with mercuric cyanide (HOFMANN and WAGNER), A., i, 514.

detection of, in wine and must (MARSIGLIA), A., ii, 891.

estimation of (JANNASCH), A., ii, 430.

estimation of, electrolytically (SHINN), A., ii, 893.

limitations of the copper-zinc couple method in estimating, in waters (PURVIS and COURTAULD), A., ii, 776.

employment of nitron for estimating, in plants and soils (LITZENBOUT), A., ii, 130.

nitrites, and ammonia, estimation of, in sea-water (RINGER and KLINGEN), A., ii, 320.

Nitrates in vegetable foods, cured meats, and elsewhere (RICHARDSON), A., ii, 208.

behaviour of, in paddy soils (DURAHARA and IWASEKI), A., ii, 127.

manurial experiments with different kinds of (SEBELIEN), A., ii, 91.

Nitrous acid and nitric acid, preparation of (FOERSTER and KOCH), A., ii, 911, 1031.

limitations of the copper-zinc couple method in estimating, in waters (PURVIS and COURTAULD), A., ii, 776.

nitrates, and ammonia, estimation of, in sea water (RINGER and KLINGEN), A., ii, 320.

Nitrites, preparation of pure, from nitrous fumes (BADISCHE ANTRAKSODA-FABRIK), A., ii, 175.

Hyponitrous acid, decomposition of (DIVERS), P., 16.

Nitrogen sulphide and its compounds (WOLBLING), A., ii, 272.

Nitrogen, estimation of (RICHMOND), A., ii, 530.

estimation of, by Dumas' method (LÆEMANN), A., ii, 629.

modification of Hufner's method for the volumetric estimation of N. (CORDIER), A., ii, 983.

estimation of total, including nitrates, in presence of chlorides (RICHARDSON), A., ii, 426.

modification of Kjeldahl's process for estimating, in foods (CHERADI), A., ii, 130.

colorimetric estimation of, in soils (CHOUCHAR and POCGET), A., ii, 223.

- Nitrogen**, estimation of, in urine (HAWK), A., ii, 64.
- Nitrogen compounds**, effect of constitution on the optical activity of (EVERATT), T., 1225; P., 148.
- optically active, effect of constitution on the rotatory power of (EVERATT and JONES), T., 1789; P., 212.
- syn-* and *anti*-stereoisomerism of (STIEGLITZ), A., i, 726.
- catalytic action of finely-divided metals on (PADOA and SCAGLIARINI), A., i, 828.
- action of finely-divided metals on (PADOA and CHIAVES), A., i, 104.
- cyclic, mechanism of the synthesis of (SIMON and MAUGUIN), A., i, 296; (SIMON), A., i, 687, 738.
- inorganic, preparation of; lecture experiments (RASCHIG), A., ii, 30.
- Nitrogenous metabolism**. See under Metabolism.
- Nitrogenous substances**, use of silver in the combustion of (ERSTEIN and DORT), A., ii, 132.
- Nitro-group**, reduction of. See under Nitro-compounds.
- Nitrohydroxy-derivatives**, aromatic, preparation of (WOLFFENSTEIN and BÖTERS), A., i, 629.
- Nitron**. See 1:4-Diphenyl-3:5-*endo*anilo-4:5-dihydro-1:2:4-triazole.
- Nitroso compounds**, relation between the absorption spectra and chemical constitution of (BALY and DESCH), T., 1747; P., 173.
- and nitro-compounds, aromatic, question of the miscibility and form-analogy in (JAEGER), A., i, 147.
- Nitrosyl fluoride**, compounds of, with antimony and arsenic pentafluorides (RUFF, STÄUBER, and GRAF), A., ii, 584.
- Nomenclature of glyoxime peroxides** (WIELAND and SEMPER), A., i, 108.
- of proteins (REPORT OF A JOINT COMMITTEE OF THE AMERICAN PHYSIOLOGICAL SOCIETY and the AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS), A., i, 301.
- of thorium compounds (HAHN), A., ii, 454.
- n*-Nonadecamethylenedicarboxylic acid** (*Eberhardt's acid*) and its ethyl ester, silver salt, and diamide (SCHAAL), A., i, 4.
- Nonaldehyde**. See Paranonaldehyde.

some, as tanning materials (LÜPRO-CRAMER), A., i, 377.
of elements of the second group, crystallography of (BECKENKAMP), A., ii, 280.
of refractory metals, silicon as a reducing agent for (NEUMANN), A., ii, 377.
acidic, heat of combination of, with sodium oxide (MIXTER), A., ii, 929.
- as- α -Oxides**, organic, the order of the addition of ammonia to (KRASSUSKY), A., i, 139.
- Oxides**. See also Metallic oxides.
- Oxime formation**, influence of acids and alkalis on the velocity of (BARRETT and LAPWORTH), T., 85.
- Oximes**, formation of (GRASSI), A., i, 800.
alkylation of (IRVINE and MOODIE), T., 102.
of the *o*-nitrotoluene series and their changes (REISSERT), A., i, 983.
of sulphonic acids (HAGA), A., i, 870; (SUZUKI), A., i, 871.
See also Amino-oximes.
- Oximinobenzoyl-aminoxime and -form-hydroxamic acid** (WIELAND and SEMPER), A., i, 108.
- α -Oximinobutyric acid**, two forms of (INGLIS and KNIGHT), T., 1600; P., 191.
- α -Oximino-fatty acids**, conductivities of the (INGLIS and KNIGHT), T., 1595; P., 191.
- Oximino-*o*-nitrophenylpyruvic acid** (REISSERT), A., i, 983.
- α -Oximinovaleic acid**, two forms of (INGLIS and KNIGHT), T., 1600; P., 191.
- α -Oximino- β -vinylquinacelidine and its methiodide** (RABE and BUCHHOLZ), A., i, 100.
- Oxomalonic acid**, methyl ester, preparation of (CURTISS and TARNOWSKI), A., i, 760.
- Oxonium salts**, cyclic, from disalicylideneacetone and from spiropyran derivatives (DECKER and FEISER), A., i, 908.
- 6-Oxy-2-allylimino-4-methyltetrahydropyrimidine and its isomerides** (MAJIMA), A., i, 223.
- Oxybursaracin** (v. BOLTON), A., i, 436.
- 4-Oxycarbostyryl**, formation of, from *o*-nitrobenzoylacetic acid (MATSUBARA), A., i, 915.
- Oxycellulose**, reaction of, with Nessler's reagent (DITZ), A., i, 954.
cellulose, and hydrocellulose, highly nitrated (BERL and KLAYE), A., i, 504.
- Oxycholestenediol**. See Dehydrocholestenediol.
- Oxycholesterol**, new reactions for (GOLODETZ), A., ii, 323.
- Oxydase of Liberian coffee** (GORTER), A., i, 346.
in Para rubber (SPENCE), A., ii, 774.
- Oxydases**, systematic investigation of (DUNY-HÉNAULT), A., i, 588.
in india-rubber (SPENCE), A., ii, 616.

- Oxydases**, estimation of, in blood (LÖB and MULZER), A., ii, 958; (LÖB), A., ii, 999.
- Oxydiborodisulphosalicylic acid**, sodium and sodio-potassium salts (BARTHE), A., i, 271.
- Oxydihydrotriazines and oxytriazines**, attempts to obtain aliphatic substituted (BILTZ and HORMANN), A., i, 616.
- 2-Oxy-4:6-dimethyl-dihydropyrimidine**. See Acetylacetonecarbamide.
- 6-Oxy-1:4-dimethyltetrahydropyrimidine**, 2-imino-, and its additive salts (MAJIMA), A., i, 223.
- 6-Oxy-2-ethylthiol-1:5- and -3:5-dimethylpyrimidines** (JOHNSON and CLAPP), A., i, 835.
- 6-Oxy-2-ethylthiol-4-methylpyrimidine-5-acetic acid** and its ethyl ester and potassium salt (JOHNSON and HEYL), A., i, 59.
- Oxygen**, atomic weight of (LEDUC), A., ii, 271.
- generation of, in a Kipp's apparatus (WOLTER), A., ii, 1028.
- spectra of, Doppler effect with canal rays (STARK), A., ii, 545.
- and hydrogen, chemical action of radium emanation on (CAMERON and RAMSAY), T., 971; P., 132.
- electrochemical equivalent of (LEHFELDT), A., ii, 559.
- basic properties of (McINTOSH), A., i, 596.
- magnetic behaviour of air, argon, and helium in relation to (TANZLER), A., ii, 152.
- polymeric forms of, constitution of (ERDMANN), A., ii, 832.
- absorption of, by electro-condensation products (LOSANITSCH), A., i, 846; 866; ii, 82.
- simple form of apparatus for observing the rate of absorption of, by polluted waters and by other fermenting liquids (ADENEY), A., ii, 781.
- action of, on copper, tin, zinc, and the alloys of tin and zinc with copper (JORDIS and ROSENHAUPT), A., ii, 107.
- action of, on metals (JORDIS and ROSENHAUPT), A., ii, 172.
- interaction of, with nitric oxide (MANDL and RUSS), A., ii, 272; (HOLWACH), A., ii, 941.
- apparatus for the constant saturation of a liquid with (LUTHER and PLOTNIKOFF), A., ii, 141.
- resistance to lack of (PACKARD), A., ii, 402.
- Oxygen and carbon dioxide**, estimation of small quantities of, in small volumes of saline solutions (BROUET and CULLIS), A., ii, 319.
- Oxygen carriers**, iron and heavy metals as (CERVELLO), A., i, 1627.
- Oxygen compounds**, quadrivalent, heat of formation of (McINTOSH), A., ii, 355.
- Oxyhaemocyanin**, preparation and properties of, crystallised from the snail (DERÉ), A., i, 375.
- Oxyhemoglobin**, behaviour of, towards reducing agents (HÜFNER), A., i, 1-4.
- Oxyhydropyridine nitriles**, hydrolysis of (PICCININI), A., i, 51, 679.
- 8-Oxy-7-indoxylacene** and its sulphonic acid (BEZDZIK and FREIDLÄNDER), A., i, 674; (GROB), A., i, 1011.
- 1-Oxy-2(2')- and -2(3')-indoxynaphthalenes** (BEZDZIK and FREIDLÄNDER), A., i, 674.
- 1-Oxy-4-methoxy-2(2')-indoxynaphthalene** (BEZDZIK and FREIDLÄNDER), A., i, 674.
- 6-Oxy-4-methyl-1-allyltetrahydropyrimidine**, 2-imino-, and its penta (MAJIMA), A., i, 223.
- 6-Oxy-2-methylimino-4-methyltetrahydropyrimidine** and its additive salts (MAJIMA), A., i, 223.
- 2-Oxy-4-methylpyrimidine**, 6-amino-. See 4-Methylcytosine.
- 6-Oxy-4-methylpyrimidine-5-acetic acid**, 6-amino- (JOHNSON and HEYL), A., i, 59.
- 6-Oxy-2-methylthiol-4-methylpyrimidine-5-acetic acid** (JOHNSON and HEYL), A., i, 59.
- 6-Oxy-2-β-naphthylaminopyrimidine** (JOHNSON, STOREY, and McCOLLYN), A., i, 838.
- 4:5-Oxy-1:2:5-osotriazoles** (*cathequaradiazoles*), constitution of the (PONZIO), A., i, 1621.
- 8-Oxy-7-oxythionaphthenylacene** (BEZDZIK and FREIDLÄNDER), A., i, 674; (GROB), A., i, 1011.
- Oxyphenyldihydropyrimidine** and its platinumchloride (GABRIEL), A., i, 751.
- 2-Oxy-6-phenylmethylamino pyrimidine and -3-methylpyrimidine** (JOHNSON and CLAPP), A., i, 836.
- 2-Oxypyrimidine**, 4-amino-. See Cytosine.
- 6-Oxypyrimidine**, picolonate of (WUELFER and JAMIESON), A., i, 253.
- 6-Oxypyrimidine**, 2-amino-. See isocytosine.
- 6-Oxy-2-thio-3:5-dimethylpyrimidine** (JOHNSON and CLAPP), A., i, 835.

- 3-Oxythionaphthen**, preparation of (FAREWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1003.
- 6-Oxy-2-o- and -p-toluidinopyrimidines** (JOHNSON, STOREY, and MCCOLLUM), A., i, 887.
- Oxytriazines** and oxydihydrotriazines, attempts to obtain aliphatic substituted (BILTZ and HERRMANN), A., i, 516.
- Ozone**, atmospheric, origin of (HENRIET and BONTSSY), A., ii, 578.
- formation of, by radium salts and emanation (NASINI and LEVI), A., ii, 793.
- formation of, by the action of the electric discharge at low temperatures (BRINER and DURAND), A., ii, 101.
- nitrogen peroxide, and hydrogen peroxide, formation of, in reactions in air which develop high temperatures (KEISER and McMASTER), A., ii, 223.
- acid properties of (MANCHOT and KAMPSCHEUTE), A., ii, 101.
- decomposition of, by light (WEIGERT), A., ii, 914.
- thermal decomposition of (CLARKE and CHAPMAN), T., 1638; F., 190; (PERMAN and GREAVES), A., ii, 480.
- action of, on olefines (HARRIES and HAEFFNER), A., i, 346.
- action of, on cyclic olefines (HARRIES and TANK), A., i, 517.
- action of, on double and treble linkings (HARRIES), A., i, 75, 387; (MOLINARI), A., i, 244, 849.
- influence of, on the condensation of water vapour (LEITHAUSER and POHL), A., ii, 372.
- lecture experiments with (HARRIES), A., ii, 171.
- nitrogen peroxide, and hydrogen peroxide, detection of, in gaseous mixtures (KEISER and McMASTER), A., ii, 222.
- Ozonides** of certain cyclic hydrocarbons, velocity of decomposition of (HARRIES and V. SPIAWA NEYMANN), A., i, 967.
- decomposition of, by water (HARRIES and TANK), A., i, 517.
- P.**
- Paddy soils**. See under Soils.
- Faigette** from the Seward Peninsula (KNOFF and SCHALLER), A., ii, 507.
- Paligorskite group** (FERSMANN), A., ii, 603.
- Palladium**, atomic weight of (KEMMERER), A., ii, 1046.
- new stage of oxidation of (WÖHLER and MARTIN), A., ii, 392.
- colloidal, reduction catalysis with (PAAL and GERUM; PAAL and ROTH), A., i, 599.
- Palladium alloys** with lead, nature of (PUSHIN and PASHSKY), A., ii, 860.
- Palladium hydride** (PAAL and GERUM), A., ii, 392.
- liquid hydrosol of (PAAL and GERUM), A., ii, 392.
- silicides (LEBEAU and JOLIBOIS), A., ii, 602.
- Palmatina** and its derivatives from calumba root (FEIST), A., i, 101.
- Palmitin-β-naphthalide**, amino-, reaction of, with diazo-salts (SULZBERGER), A., i, 483.
- Palmitohydroxamic acid** (MORELLI), A., i, 758.
- Pancreas**, secretory activity of the, under the influence of hydrochloric acid and intestinal extract (POPIELSKI), A., ii, 119.
- a new function of the, and its relation to *Diabetes mellitus* (LOEWI), A., ii, 712.
- putrefying, new base from (ACKERMANN), A., i, 1007.
- guanlyic acid from the (STEUDEL), A., i, 70; (v. FÜRTH and JERUSALEM), A., ii, 119.
- nucleic acid of the. See under Nucleic acids.
- Pancreatic diabetes**. See Diabetes.
- Pancreatic juice**, variations in the proteolytic activity of (CAMUS and GLEY), A., ii, 205.
- action of the amylase of, and its activation by gastric juice (BIERRY), A., ii, 305.
- Panicum stagninum* ("bourgon") from Upper Senegal (PERRON and TASSILLY), A., ii, 726.
- Pantogen**, determination of the atomic weight of (HINRICHS), A., ii, 1027.
- Papaverine**, phenolbetaines from (DECKER, DUNANT, and GIRARD), A., i, 204.
- quaternary salts (DECKER and DUNANT), A., i, 206.
- Paraffin wax** from the Ladysmith Pit, Whitehaven Collieries (BEDSON), A., ii, 115.
- Paraffins**, higher normal, fractional distillation of, from lignite in the vacuum of the cathode light (KRAFFT), A., i, 1.
- See also Hydrocarbons.

- Paraformaldehyde** (Auerbach and Barschall), A., i, 131.
- Parahopelite** from Rhodesia (Spencer), A., ii, 397.
- Paralactic acid.** See *d*-Lactic acid.
- Paramæcia**, the point of attack of photodynamic substances in (v. Tappeiner, Osthelder, and Erhardt), A., ii, 867.
- inorganic salts of the (Peters), A., ii, 209.
- Paranonaldehyde** (Molinari and Barosi), A., i, 850.
- Parannucleic acid.** See Polypeptidophosphoric acid.
- Parasaccharin**, C₃-sugars from (Kiliati), A., i, 135.
- d*-**Parasaccharinic acid**, brucine salt and phenylhydrazide (Net), A., i, 8.
- Paratoite** from Elder Rock, South Australia (Mawson and Cooke), A., ii, 398.
- Parenteral utilisation** of carbohydrates (Mendel), A., ii, 306.
- Parasite**, composition of (Tschernik), A., ii, 862.
- Parkia biplobaca*, pulp of (Goris and Crête), A., ii, 218.
- Parsley**, French, essential oil of, and the contained ether (Thoms), A., i, 902.
- Parthenogenesis**, isotonic and isosmotic solutions in (Delage), A., ii, 305.
- comparative study of phenols as agents in (Delage and de Beauchamp), A., ii, 51.
- artificial, the difference between isosmotic and isotonic solutions in (Loeb), A., ii, 710.
- α -Particles.** See under Photochemistry.
- Passivity**, review of the various theories of (Fredenhagen), A., ii, 679.
- of metals (Byers), A., ii, 1026.
- Pastilles**, estimation of mercuric chloride in (Saporetti), A., ii, 133; (Rimini), A., ii, 493; (Fiora), A., ii, 735.
- Pastry**, action of heat on the lecithin phosphoric acid contained in (Ludwig), A., ii, 744.
- Pasture land**, material experiments on (Solberg), A., ii, 422.
- Pathological fluids**, molecular concentration of (Javal), A., ii, 716.
- organs, double refracting substances from (Panzer), A., ii, 122.
- Pea**, legumelin and vicilin from. See Legumelin and Vicilin.
- Peas**, continuous growth of, on the same soil (Suzuki), A., ii, 617.
- Peat**, Indiana, chemical examination and calorimetric test of (Lyons and Carpenter), A., ii, 890.
- Pectin substance** from coffee (Gortek), A., i, 346.
- Pectins** from the fruits of *Lonicera Xylosteum*, *Symphoricarpos racemosa*, and *Tamus communis* (Bridel), A., ii, 125.
- α -Pectolinarin** (Klober), A., i, 904.

- Phenols**, *p*-amino-, maleic and fumaric derivatives of (PIUTTI), A., i, 783.
- bromo- and chloro-, behaviour of, with potassium hydroxide, zinc bromide and chloride, sulphuric acid, potassium carbonate, and potassium acetate (TYMSTRA), A., i, 262.
- See also Polyphenols.
- Phenolbetaines** from papaverine (DECKER, DUNANT and GIRARD), A., i, 204.
- Phenolcarboxylic acid**, strength of the second stage of the dissociation of (LEY and ERLER), A., i, 177; (OBERMILLER), A., i, 634; (THIEL), A., i, 791.
- Phenolcarboxylic acids**, azo-derivatives of (GRANDMOUGIN and FREIMANN), A., i, 1023.
- methyl-carbonato-derivatives of, and their use for synthetical operations (FISCHER), A., i, 892.

- Phenolphthalein**, change of colour of (WEGSCHEIDER and SCHUGOWITSCH), A., ii, 806.
 dissociation of (HILDEBRAND), A., ii, 646.
 purgative action of, and of its disodium derivative (FLEIG), A., ii, 813.
 use of, in the titration of acids in presence of sulphurous acid (POZZI-ESCOT), A., ii, 628.
 sodium and potassium salts (MEYER and MARX), A., i, 652.
- Phenolsulphonic acid** and its salts, estimation of (HÜBENER), A., ii, 641.
- Phenolsulphonic acid**, *p*-amino- (BRUNNER and VILLEUMIER), A., i, 879.
- Phenol-*p*-sulphonic acid** and its benzyl ether (SCHULTZ and ICHENHAUSER), A., i, 230.
 2-amino-, arylsulphonates of (CASSELLA & Co.), A., i, 785.
 2,6-dibromo-, methyl and ethyl esters and sulphanilide of (ZINCKE and BRUNE), A., i, 336.
 2-chloro-3-nitro-6-amino-, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 785.
 5-nitro-2-amino-, preparation and diazo-derivative of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 157.
- Phenol-5-sulphonic acid**, 2-amino-, and its diazo-derivative, preparation of (CASSELLA & Co.), A., i, 785.
 4-chloro-2-amino-, and its diazo-derivative (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- Phenolsulphonic acids**, conditions of formation of (OBERMILLER), A., i, 260.
 acidity of the different (LEY and ERLER), A., i, 177; (OBERMILLER), A., i, 634.
 strength of the second stage of the dissociation of (THIEL), A., i, 791.
 action of phosphorus chlorides on (ANSCHÜTZ), A., ii, 83.
- Phenolsulphonic acids**, *o*- and *p*-, copper salts, and the action of ammonia and pyridine on (LEY and ERLER), A., i, 177.
- Phenol-4-sulphonic acids**, 3-nitro-6-amino-, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 785.
- 1:2-Phenonaphthacarbazole-*N*-sulphonic acid** and its barium and sodium salts (BUCHNER and SEYDE), A., i, 455.
- Phenophenanthracidine**, preparation of (ATSTIN), T, 1765; P., 200.
- Phenorosamine**, diacetyl derivative, chloride of (KEHRMANN and DENGEL), A., i, 1002.
- Phenoxazine derivatives**, preparation of (AKTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 1010.
- Phenoxide**, ammonium (BICH), A., i, 259.
- Phenoxide**, 2,4:6-trifido-, basic bismuth salts (CARRASCO), A., i, 336.
- Phenoxides**, alkali, action of chloro-methyl ether on (REYCHLER), A., i, 158.
- 4-Phenoxybenzaldehyde** and its azine, oxime, and phenylhydrazones, synthesis of (GATTERMANN), A., i, 33.
- Phenoxydichloropropane** (BOYD and MARLE), T., 841; F., 92.
- Phenoxydiphenetisulphonium** salts (BARNETT and SMILES), P., 123.
- Phenoxydiphenylsulphonium** salts (BARNETT and SMILES), P., 124.
- 4-Phenoxy-3-methyltritanic acid** and its anhydride (V. LIEBIG), A., i, 541.
- α -Phenoxypropane**, γ -chloro- β -hydroxy-, (FISCHER and KRÄMER), A., i, 528.
- β' -Phenoxy- β -2:5-quinolylacetic acid** α -1:2:5'-tetrahydroxy-, formation of (ENGELS, PERKIN, and ROBINSON), T., 1165.
- 5-Phenoxy- γ -valerolactone** and its α -carboxylic acid and their bromo-derivatives (FISCHER and KRÄMER), A., i, 858.
- 5-Phenoxy- γ -valerolactone**, bromo- α -amino-, and its hydrobromide and hydrochloride (FISCHER and KRÄMER), A., i, 858.
- Phenyl**, transposition of, in aromatic iodohydrins (TIFFENEAU), A., i, 165, 166; (TIFFENEAU and DAUDEL), A., i, 972.
- Phenyl arsenite** (LANG, MACKEY, and GORTNER), T., 1369; P., 150.
 benzyl sulphide (FROMM and ROESCKE), A., i, 968.
 ethyl ether. See Phenetole.
 glycidic ether and its reactions (BOYD and MARLE), T., 840; P., 92.
 mercaptan, action of aluminium chloride on (DEYSS), A., i, 539.
p-nitro-, derivatives of (FROMM and WITTMANN), A., i, 631.
 methyl ether. See Anisole.
 sulphide, 4:6:4':6'-tetra-bromo- and -chloro-2:2'-dinitro- (BLANKSMA), A., i, 147.
- Phenylacetamide**, *o*- and α -bromo- (STEINKOPF and BENEDEK), A., i, 981.
o-nitro- (REISSERT), A., i, 983.

- Phenylacet-anilide**, *-o-*, *-m-*, and *-p-*-toluidides and **-phenylhydrazide**, α -cyano- (HESSLER), A., i, 188.
- Phenylacetic acid**, brucine and cinchonine salts, and their optical activity (HILDITCH), T., 1890.
- Phenylacetic acid**, amino-, resolution of, into optically active constituents and its *N*-formyl derivatives (FISCHER and WEICHHOLD), A., i, 419.
- α -amino-, optical resolution of (EHRlich and WENDEL), A., i, 269; (BETTI and MAYER), A., i, 639.
- l*- α -amino-, and its hydrochloride, phenylcarbinide, phenylhydantoin and *l*-diphenylhydantoin (EHRlich and WENDEL), A., i, 269.
- Phenylacetone**, isonitroso- (PONZIO and GIOVETTI), A., i, 834.
- α -**Phenylacetone**, α -amino-, and its salts (GABRIEL and LIECK), A., i, 466.
- Phenylacetone**, *benzyl cyanide*, sodium, action of, on ethyl cinnamate (AVERY and McDONALD), A., i, 343.
- Phenyl-*p*-acetylaminotolylodionium** hydroxide and salts (WILLGERODT and GARTNER), A., i, 877.
- Phenylalanine**, 3:5-dibromo-, and its ethyl ester and salts (WHEELER and CLAPP), A., i, 897.
- p*-iodo-, and its derivatives (WHEELER and CLAPP), A., i, 981.
- Phenylallylthiocarbamide**, reactions of, with acyl chlorides (DIXON and TAYLOR), T., 24.
- Phenylamino-**. See Anilino-.
- Phenyl-*p*-aminobenzeneazo-8-naphthol** and its 2- and 4-*mono*-, 2:4-*di*-, and 2:4:6-*tri*-nitro-derivatives (MORGAN and MICKLETHWAIT), T., 609; P., 48.
- Phenyl-*p*-aminobenzenediazonium** chloride, 2:4-*di*-nitro- (MORGAN and MICKLETHWAIT), T., 610.
- Phenylaminodimethylcarbinol** and its \bullet -dibenzoyl derivative (RIEDEL), A., i, 769.
- Phenyl-1-*o-*, *-m-*, and *-p*-amino- and -nitro-phenyl 2-methylpyrrole-3-carboxylic acids**, ethyl esters (BORSCHKE and TITSINGH), A., i, 104.
- 1-Phenyl-5-aminophenylaminotriazole**, 3-thio-, and its diacetyl and dibenzylidene derivatives (FROMM and BAUMHAUER), A., i, 792.
- α -**Phenyl-*b*-anisylethylthiocarbamide** (BUSCH and LEEFHELM), A., i, 153.
- Phenyl- β -*o*-anisylhydraerylic acid** and its ethyl ester and barium salt (STOERMER and FRIDERICI), A., i, 180.
- Phenylanisylidene-*p*-phenylenediamine** and its hydrochlorides (MOORE and WOODBRIDGE), A., i, 686.
- Phenylanisylidethylenes** (STOERMER and FRIDERICI), A., i, 179.
- β -Phenyl- β -anisylpropionic acid** (STOERMER and FRIDERICI), A., i, 179.
- Phenylarsinic acid** (*phenylarsonic acid*) and *p*-chloro- and *p*-hydroxy- (BERTHEIM), A., i, 591.
- p*-amino- (*arsenitic acid*), preparation of derivatives of (KURATORIUM DER GEORG und FRANZISKA SPEYERSCHEN STUDIENSTIFTUNG), A., i, 591, 747.
- homologues and derivatives of (BENDA and KAHN), A., i, 591.
- sodium salt. See Atoxyl under Arsenic.
- amino-, an isomeric (BERTHEIM), A., i, 590.
- p*-hydroxy- (BARROWCLIFF, PYMAN, and REMFRY), T., 1895.
- p*-iodo-, biochemical investigations of (BLUMENTHAL and HERSCHMANN), A., ii, 878.
- 2-Phenylazimobenzene**, 4'-hydroxy- (ULLMANN and FURIN), A., i, 298.
- Phenylazooacetoacetic acid**, ethyl ester, benzoylhydrazone of, and the action of alkali on (BÜLOW and SCHAUB), A., i, 705.
- γ -**Phenylazoglutaconic acid**, ethyl ester, phenylhydrazone of (HENRICH and THOMAS), A., i, 114.
- Phenylazo-**. See also Benzeneazo-.
- 1-Phenyl-5-benzeneazo-6-pyridazone-3-carboxylic acid**, ethyl ester (HENRICH and THOMAS), A., i, 114.
- 2-Phenylbenzopyranol(1:4)**, 7-hydroxy-, anhydrohydrochloride and platinum chloride of (PERKIN and ROBINSON), T., 1098.
- 2-Phenylbenzotriazine**, imino-*m*-cyano-amino-, and its hydrochloride (PIERON), A., i, 925.
- 2-Phenyl-1:2:3-benzotriazole**, 5-amino-, change of the colour of fluorescence of, with the solvent (LEY and v. ENGELHARDT), A., ii, 746.
- Phenyl α -benzoylphenyl- α -phenyl-*n*-propyl ketone** (KÖHLER), A., i, 777.
- Phenylbenzylbenzylidenehydrazine** (MICHAELIS), A., i, 471; (GOLDSCHMIEDT), A., i, 572.
- Phenylbenzylethylpropylsilicane**, sulphonation of (MARSDEN and KIPPING), T., 203; P., 12.
- Phenylbenzylhydrazine** and its hydrochloride (PONZIO and VALENTE), A., i, 458.

- β -Phenylbenzylhydrazine**, and its salts, and acyl derivatives and their nitroso-derivatives (SCHLENK), A., i, 737.
- as-Phenylbenzylhydrazine**, action of, on carbamide (MILRATH), A., i, 581. diacetyl derivative (MILRATH), A., i, 1014.
- p-Phenylbenzylideneamino- α -alkyl-cinnamic acids**, esters, and their liquid crystals (VORLÄNDER and KASTEN), A., i, 641.
- Phenylbenzylidenemethylthiosemicarbazide** (MICHAELIS and HADANCK), A., i, 1020.
- 1-Phenyl-4-benzylidene- Δ^1 -cyclopenten-3-one** and its 4-*o*-hydroxy- and dimethylamino-derivatives (BORSCHKE and MENZ), A., i, 148.
- Phenylbenzylidene-p-phenylenediamine**, hydrochlorides of (MOORE and WOODBRIDGE), A., i, 636.
- Phenylbenzylmethylallylammonium salts**, *p*-bromo-, optical activity of (EVERATT), T., 1236; P., 148.
- Phenylbenzylmethylamine**, *p*-bromo- (EVERATT), T., 1236.
- Phenylbenzylmethyl-*n*-butylammonium salts**, *p*-bromo-, optical activity of (EVERATT), T., 1233; P., 148.
- 1-Phenylbenzylmethylpropylammonium chloride** (E. and O. WEDEKIND and PASCHKE), A., i, 335.
- Phenylbenzylsemicarbazide** and its diacetyl derivative (MILRATH), A., i, 581.
- as-Phenylbenzylsemicarbazide** and its diacetyl derivative (MICHAELIS), A., i, 471; (MILRATH), A., i, 581.
- α -Phenyl- β -benzylsuccinic acid** and its silver salt (AVERY and UFFSON), A., i, 343.
- Phenylbenzylsulphone**, *p*-nitro- (FROMM and WITTMANN), A., i, 632.
- s-Phenyl dibromo-*o*-hydroxybenzylhydrazine** and its acetyl and benzoyl derivatives (ATWEES and DANNEHL), A., i, 459.
- α -Phenylbutane**, γ -amino-, and its additive salts and benzoyl derivative (SCHLENK), A., i, 738.
- Phenyl- β -butanone**, *p*-amino-, and its semicarbazone, and *p*-nitro-, semicarbazone of (MECH), A., i, 655.
- o*-nitro-, oxime and semicarbazone of (MECH), A., i, 655.**
- α -Phenylisobutyl alcohol** and its acetate and phenylcarbamate (GUERBER), A., i, 163, 635.
- 3-Phenyl- β -*n*-butylhydracrylic acid** (SCHROETER and BUCHHOLZ), A., i, 170.
- β -Phenyl-*n*-butyric acid**, synthesis of and its amide and anilide (EYKMAN), A., i, 795.
- γ -Phenylbutyric acid**, α -cyano- γ -hydroxy-, and its lactone (BOUGAULT), A., i, 422.
- β -imino- α -cyano-**, and its ethyl ester (BEST and THORPE), P., 283.
- β -iodo- γ -hydroxy-, and β -iodo- α - γ -hydroxy-, lactones of (BOUGAULT), A., i, 538.**
- Phenylbutyric acids**, α -, β -, and γ -, synthesis of (EYKMAN), A., i, 23.
- Phenylcarbamie acid**, calcium salt (ERDMANN and VAN DER SMISSEN), A., ii, 588.
- Phenylcarbamie acid**, *o*-chlorophenyl ester (MICHAEL and COBB), A., i, 849.
- Phenylcarbamide**, amino- (*o*-phenylbenzylcarbazide), reactions of (ROLLA), A., i, 473.
- m*- and *p*-cyanoamino-** (PIERSON), A., i, 925.
- Phenylcarbimide**, reactions of (VALLEY), A., i, 976.
- formation of carbophilphenylimide triaz** (STOLLE), A., i, 415.
- as reagent for determining the constitution of merotrope compounds** (MICHAEL and COBB), A., i, 947.
- 3-Phenylcarbostyryl** (HÜBNER), A., i, 288.
- 2-Phenylisocarbostyryl-4-carboxylic acid**, and its ethyl ester (DICKMAN and MEISER), A., i, 895.
- Phenylcarbylamine** from nitrobenzene and from pyrogallol (BRENNER and VUILLEUMIER), A., i, 878.
- r*-Phenylchloroacetic acid**, resolution of (MCKENZIE and CLOUGH), T., 813; P., 91.
- 1-Phenylchloroacetic acid**, displacement of halogen in, by hydroxy- and methoxy-groups (MCKENZIE and CLOUGH), T., 811; P., 91.
- Phenylchloroisopropyl alcohol** and its acyl derivatives (FOURNEAU and TIFFENEAU), A., i, 163.
- 3-Phenylcinchonie acid** and its derivatives (HÜBNER), A., i, 288.
- β -Phenylcinnamic acid** (*β* -*o*-phenylacrylic acid) and its salts (RIPE and BUSOLT), A., i, 23.
- Phenylcinnamylene-p-phenylenediamine** and its hydrochlorides (MOORE and WOODBRIDGE), A., i, 636.
- α -Phenylcinnamylidenesuccinic acid**, methyl ester, reaction of, with organic magnesium compounds (REINH and REYNOLDS), A., i, 988.
- β -Phenylcoumarin** (STOERMER and FREDERIC), A., i, 189.

- Phenylisocrotonic acid**, volumetric estimation of (BOUGAULT), A., i, 983.
- Phenylisocrotonophenone** and its oxime and *O*-benzoyl derivative (WIELAND and STENZL), A., i, 35.
- Phenylcyanamide**, *p*-iodo-, and the carbamide (PIERRON), A., i, 925.
- N*-Phenyldiacetonitrile** and its phenylhydrazine derivative, and *m*- and *p*-chloro- and *p*-hydroxy-derivatives (v. MEYER and SCHUMACHER), A., i, 909.
- 9-Phenyldibenzopyryronium** and its derivatives (DECKER and FELSNER), A., i, 1003.
- Phenyldibenzylazonium bromide** (PONZIO and VALENTE), A., i, 458.
- 1-Phenyl-2,4-dibenzylidenecyclopentan-3-one** (BORSCHKE and MENZ), A., i, 149.
- β -Phenyldihydrocampholenic acid**, synthesis of (EYKMAN), A., i, 23.
- Phenyldihydroisolauronic acid**, synthesis of (EYKMAN), A., i, 23.
- 2-Phenyldihydroisaphthatriazine**, imino-, hydrochloride of (PIERRON), A., i, 926.
- Phenyldimethyl-*n*-butylammonium iodide**, *p*-bromo- (EVERATT), T., 1233.

metabolism. See under Metabolism.
poisoning by. See Poisoning.
Phosphorus alloys with carbon and iron (GORENS and DOBBELSTEIN), A., ii, 1042.
with copper. See Phosphor-copper.
with iron (GERCKE), A., ii, 1041.
with tin. See Phosphor-tin.
Phosphorus compounds with nickel (KONSTANTINOFF), A., ii, 855.
with silicon, titanium, and zirconium (GEWECKE), A., ii, 597.
Phosphorus amino-compound in egg-bolk (MACLEAN), A., ii, 963.
Phosphorus pentabromide, liquid, specific volumes of (PRIDEAUX), P., 214.
chloride and gold chloride, complex, derivatives of (LEVI-MALVANO), A., ii, 774.
tetrachloride, chlorinating action of (HÖRING and BAUM), A., i, 527; (SCHMIDT), A., i, 654.
reaction of, on halogenated acid amides (STEINKOFF, BENEDEK, GRÜNNP, and KIRCHHOFF), A., i, 961.
reaction of, on the methylene ethers of catechol derivatives (BARGER), T., 563, 2081; P., 50, 237.
reaction of, with phenols (AUTENRIETH and GEYER), A., i, 156.
reaction of, on phenolsulphonic acids (ANSCHÜTZ), A., i, 83.
Phosphorus chloronitride, action of ammonia on (BESSON and ROSETT), A., ii, 583.
hydride. See Hydrogen phosphide.
pentoxide (phosphoric oxide), estimation of, by uranium (REPITON), A., ii, 320, 428.
Phosphoric acid, electrical conductivity of (PHILLIPS), P., 239.
quantitative vaporisation of, from phosphates in a current of chlorine and carbon tetrachloride or of carbon tetrachloride only (JANNASCH and JILKE), A., ii, 685.
action of, on silicic acid and silicate glass (HÜTTNER), A., ii, 838.
reversion of, in superphosphates (HERBST), A., ii, 374.
in barley (WINDISCH), A., ii, 528.
loss of, in the incineration of cereals (LEAVITT and LE CLERCQ), A., ii, 428, 531.
in soil. See under Soil.
esterification of, by glycerol (PRUNIER), A., i, 2.
esters, preparation of, from phosphoric oxide and the diglycerides of fatty acids, and their bromo- and iodo-derivatives (ULZER and BATIK), A., i, 599.
læmatoxylum as an indicator in the titration of (LYONS), A., ii, 532.
titration of, in superphosphates (KOHN), A., ii, 531, 895.
detection of, in minerals (LIDOFF), A., ii, 894.
estimation of (V. LORENZ), A., ii, 777; (FALLADA), A., ii, 983.
estimation of, volumetrically (COBLENTZ and MAY), A., ii, 428.
estimation of, alkalimetrically, by Neumann's method (GREGERSEN), A., ii, 64.
Pemberton's method for the estimation of (LAGERS), A., ii, 896.
estimation of, as phosphomolybdic acid (CHRISTENSEN), A., ii, 895; (KABEN), A., ii, 896.
estimation of, by the uranium process (REPITON), A., ii, 320, 428.
estimation of, in basic slags by Grete's method (KETNER), A., ii, 64.
modification of Petermann's method for estimating citrate-soluble, in precipitated calcium phosphate (FINGERLING and GROMBACH), A., ii, 131.
estimation of, in foods (WÖRNER), A., ii, 732.
estimation of, in urine (FERRARO), A., ii, 733.

Phosphorus:—

- Phosphoric acid**, alumina, and iron, estimation of, in presence of each other (COOKSEY), A., ii, 987.
- separation of, from tungstic acid (v. KNORRE), A., ii, 281.
- Phosphates**, acid (PARRAVANO and MIELI), A., ii, 837.
- insoluble, of raw bone-meal and natural raw rock phosphate, solvent action of soil bacteria on (SACKETT, PATTEN, and BROWN), A., ii, 415.
- sparingly soluble, factors which influence the manual action of (SÜDERBAUM), A., ii, 728.
- and other salts soluble in acids, qualitative analysis of (CARON and RAQUET), A., ii, 630.
- See also Mineral phosphates.
- Polyphosphates** (PARRAVANO and CALCAGNI), A., ii, 838.
- Phosphoric acids**, molecular weights of, determined by cryoscopy (GIRAN), A., ii, 686.
- hydrates of (GIRAN), A., ii, 685.
- Hypophosphoric acid**, molecular weight and hydrates of (ROSENHEIM and PRITZE), A., ii, 942.
- Phosphorous acid**, constitution of (PALAZZO and MAGGIACOMO), A., ii, 488.
- oxidation of, by iodine (STERLE), T., 2203; P., 193.
- Hypophosphorous acid**, effect of temperature on the maximum electrolytic conductivity of (WEGELIUS), A., ii, 801.
- Superphosphate**, action of, on man-golds (SJÖLLEMA and VAN DAALEN), A., ii, 618.
- Superphosphates**, titration of phosphoric acid in (KOHN), A., ii, 531, 895.
- Phosphorus trithiodanide** (DIXON and TAYLOR), T., 2153; P., 239.
- sulphides, vapour densities of (STOCK and v. BEZOLD), A., ii, 274.
- pentasulphide* (STOCK and SCHARFENBERG), A., ii, 274.
- Phosphoryl bromide** (BERGER), A., ii, 274.
- trithiodanide* (DIXON and TAYLOR), T., 2157; P., 239.
- Phosphorus organic compounds**, absorption and assimilation of (MARFORD), A., ii, 1052.
- with gold (LEVI-MALVANO), A., i, 775.
- with nitrogen and sulphur in vegetables (STUTZER), A., ii, 124.

- Phosphorus**, antimony, and arsenic, microchemical detection of traces of (SJÖLLEMA), A., ii, 224.
- the nitro-molybdate method for the detection of, in tissues (NASMITH and FIDLAR), A., ii, 776.
- estimation of, in ash analysis (LEAVITT and LE CLERC), A., ii, 428, 531.
- estimation of, in calcium carbides (HINRICHSSEN), A., ii, 131.
- estimation of, in cast-iron, iron, and steel (CHESNEAU), A., ii, 427.
- estimation of, colorimetrically, in steel (Misson), A., ii, 732.
- new method of estimating, in organic compounds (BAY), A., ii, 531.
- estimation of, in phosphorised oils (WÖRNER), A., ii, 629.
- estimation of, in phosphor-tin (GEMMELL and ARCHBUTT), A., ii, 626.
- Phosphorus arsenic group**, allotropic modifications of the elements of the (LINCK), A., ii, 176, 373; (ERDMANN), A., ii, 275.
- Phosphoryl compounds**. See under Phosphorus.
- PHOTOCHEMISTRY:—**
- Photochemistry** (TRAUTZ), A., ii, 339.
- Light**, chemical action of (CIAMICIAN and STRLEB), A., i, 277, 555; (WEIGERT), A., ii, 5, 914; (CIAMICIAN; FOWLER), A., ii, 914.
- electrochemistry of (BANCROFT), A., ii, 448, 549, 788.
- a theory of the catalytic influence of (WEIGERT), A., ii, 5.
- action of, on water of crystallisation (McKEE and BERKHEISER), A., ii, 1003.
- absorption of, in solutions of aniline colours from the standpoint of optical resonance (KALANDER), A., ii, 139.
- ultra-violet, reactions in (THIEL), A., ii, 79.
- Sunlight**, catalytic reactions of (NEUBERG), A., ii, 915.
- action of, on the glass of old mirrors (MASCHHAUPT), A., ii, 1003.
- tropical, chemical action of (FOWLER), A., ii, 914.
- Photochemical cyclic action** (LUTHER and PLOTNIKOFF), A., ii, 140.
- equilibria and catalytic reactions (VANZETTI), A., ii, 915.
- processes, thermodynamic treatment of (WEIGERT), A., ii, 748.
- pseudo-reversible (LUTHER and PLOTNIKOFF), A., ii, 140.
- reactions (WEIGERT), A., ii, 5, 914.

PHOTOCHEMISTRY :—

- Photochemical reactions**; the mathematical treatment of, on thermodynamical and electrochemical basis (BYK), A., ii, 339.
- Photo-electric sensitiveness** and fluorescence of organic substances (STARK and STEUBING), A., ii, 746.
- Photographic action** of metals and hydrogen peroxide (SAELAND), A., ii, 789.
- films, the silver hydrogel in (LÜPPO-CRAMER), A., ii, 841, 945, 1024.
- image, reduction of, with persulphate and according to Farmer (PINNOW), A., ii, 245.
- latent, as a colloidal compound (LÜPPO-CRAMER), A., ii, 378.
- impressions produced by radium emanations (MUÑOZ DEL CASTILLO and DÍAZ DE RADA), A., ii, 749.
- plates, action of potassium salts on (LEVIN and RUER), A., ii, 448.
- preparations, relation of absorption and sensitiveness in (LEHMANN), A., ii, 789.
- Optical activity** and unsaturation, relation between (HILDITCH), T., 1, 700, 1388, 1618; P., 61, 186, 195.
- of compounds having simple molecular structure (POPE and READ), T., 794; P., 99.
- of nitrogen compounds, effect of constitution on the (EVERATT), T., 1225; P., 148.
- antipodes, physiological action of, on higher organisms (BRUNI), A., ii, 876.
- electric properties of liquid mixtures (CHAUDIER), A., ii, 788.
- inversion, Walden's (MCKENZIE and CLOUGH), T., 811; P., 91; (FISCHER and SCHEIBLER), A., i, 324, 857.
- isomerides (v. OSTROMISLENSKY), A., ii, 918.
- physiological action of (CUSHNY), A., ii, 720.
- magneto phenomena, use of very low temperatures for the study of (BEQUEREL), A., ii, 3.
- properties and electron theory (ERFLE), A., ii, 77.
- properties of liquids, application of, to the study of polymerisation and analogous phenomena (ANDRÉEFF), A., ii, 547.
- of dissolved substances, influence of temperature on the (CHÉNEVEAU), A., ii, 77.

PHOTOCHEMISTRY :—

- Optical rotatory power**, determination of (CALDWELL and WHYMPER), A., ii, 817.
- Optically active compounds**, relation between rotatory power and chemical constitution of (CHARDIN and SIKORSKY), A., ii, 470; (CHARDIN), A., ii, 548, 912.
- influence of solvents on the rotation of (PATTERSON and THOMSON), T., 355; (PATTERSON and McDONALD), T., 936; P., 125; (PATTERSON), T., 1836; P., 216; See also Nitrogen compounds.
- Optically isomeric substances**, relative rate of absorption of, from the intestine (DAKIN), A., ii, 710.
- Radiation** from drying oils (SCHMIDT), A., ii, 796.
- from radioactive substances, distribution of the (GREINACHER), A., ii, 551; (SCHMIDT), A., ii, 791.
- metallic, so-called (SAELAND), A., ii, 789.
- penetrating (STRONG), A., ii, 142.
- of the Helmer lamp and of osmium (LEDER), A., ii, 5.
- Radiations**, invisible, from the explosive discharge in air (SCHINAGLIA), A., ii, 796.
- Rays**, chemical changes produced by different kinds of (NEUBERG), A., ii, 915.
- positive, nature of the (WIEN), A., ii, 1006.
- ultimate, of the metalloids (DE GRAMONT), A., ii, 645.
- ultra-violet, detection of (SCHALL), A., ii, 139.
- α-Rays**, range of activity and absorption of (ASCHKINASS), A., ii, 920.
- ionisation due to (MOULIN), A., ii, 921.
- retardation of, by metal foils, and its variation with the speed of the α-particles (TAYLOR), A., ii, 793.
- α-Particle**, charge and nature of the (RUTHERFORD and GEIGER), A., ii, 794.
- α-Particles** from radioactive matter, method of counting the number of (RUTHERFORD and GEIGER), A., ii, 555.
- β-Rays**, quality of the secondary ionisation due to (BRAGG and MADSEN), A., ii, 921.
- of radioactive elements, absorption of (HAHN and MEITNER), A., ii, 452.

PHOTOCHEMISTRY:—

- β -Rays** from uranium, scattering of, by matter (CROWTHER), A., ii, 247.
 secondary (MCLELLAND), A., ii, 650.
- Rays**, α -, β -, and secondary, from radioactive substances, changes in velocity in an electric field of (EVE), A., ii, 555.
- γ -Rays**, nature of the (THOMSON), A., ii, 751.
 experimental investigation of the nature of (BRAGG and MADSEN), A., ii, 556.
 secondary, due to γ -rays of radium C (EVE), A., ii, 795.
- Anode rays** (GEHRCKE and REICHENHEIM), A., ii, 343.
- Canal rays**, distribution of intensity in the spectra of, in hydrogen (STARK and STREUBING), A., ii, 546.
 Doppler effect with, in the spectra of oxygen (STARK), A., ii, 545.
 phosphorescence produced by (TROWBRIDGE), A., ii, 246.
 volatilisation produced by (STARK), A., ii, 1007.
- Cathode rays**, secondary, from gases, velocity of (THOMSON), A., ii, 751.
- Moser rays**, so-called (LÉGRADY), A., ii, 142.
- Röntgen rays**, heat effects produced by, in lead and zinc (BUMSTEAD), A., ii, 342.
 action of, on corundum (BORDAS), A., ii, 9.
 have, an action on radioactive substances! (GUYE, SCHIDLOF, and KERNBAUM), A., ii, 142.
 influence of pressure on ionisation produced in gases by (ROTHE), A., ii, 1007.
- Radioactive changes**, influence of temperature on (ENGLER), A., ii, 650.
- Radioactive compounds**, kinetics of the transformations of (GUYE), A., ii, 451.
- Radioactive emanations**, condensation of (HENRIOT), A., ii, 651.
 in air, amount of, from the soil (GÖCKEL), A., ii, 452.
 absorption of, by charcoal (BOYLE), A., ii, 1005.
- Radioactive minerals**, association of helium and thorium in (STRUETT), A., ii, 144.
 the lithium in (GLEBITSCH), A., ii, 9, 246; (RAMSAY and CAMERON), A., ii, 247.

PHOTOCHEMISTRY:—

- Radioactive substances**, distribution of the radiation from (GREENACHER), A., ii, 551; (SCHMIDT), A., ii, 791.
 have X-rays an action on? (GUYE, SCHIDLOF, and KERNBAUM), A., ii, 142.
- See also Actinium, Actinium C, Alkali metals, Ionium, Mesothorium, Polonium, Potassium, Radio-lead, Radium, Thorium, Uranium, Uranium compounds, and Uranyl molybdate.
- Radioactivity**, lectures on (MARCKWALD; DEBIERNE), A., ii, 550.
 law of transformation in stages and (SCHMIDT), A., ii, 550.
 and helium in rare and common minerals (STRUETT), A., ii, 649.
 in Australian minerals (MAWSON and LABY), A., ii, 917.
 atmospheric, constituents of (DADOURIAN), A., ii, 453.
 excited, rate of decay of, from the atmosphere of Sydney (LUSBY and EWING), A., ii, 916.
 of air over the open sea (RUGE), A., ii, 80.
 of ordinary metals and the penetrating radiation from the earth (MCLENNAN), A., ii, 643.
 of Roumanian petroleum (HIRMUZESCU), A., ii, 453.
 of the rocks in the region traversed by the line to the Simplon (GALLO), A., ii, 917.
 of sea water (JOLY), A., ii, 246.
 of springs. See under Water.
 of uranium minerals (BOLTWOOD), A., ii, 454.
 of Vesuvian cotunnite (ROSE), A., ii, 9.
- Radiology**, reflections on (REYCHLER), A., ii, 1003.
- Polarimetric measurements** with small quantities of liquid (DONAT), A., ii, 647.
 study of intramolecular rearrangement in inactive substances (PATTERSON and McMILLAN), I., 1041; P., 135.
- Dispersion and refraction** of triazo-compounds (PHILIP), T., 913; P., 114.
 abnormal, of metallic vapours (SCHÖN), A., ii, 334.
- Refraction and dispersion** of triazo-compounds (PHILIP), T., 913; P., 114.

PHOTOCHEMISTRY :—

- Molecular refractions** of some carbamidoximes (CONDUCHÉ), A., i, 156.
- Refractive index** of mixtures of alcohols and water (DOROSCHESKY and DVORSCHANTSCHIK), A., ii, 241, 785.
- of alcohol and water mixtures (DOROSCHESKY and DVORSCHANTSCHIK), A., ii, 241; (ANDREWS), A., ii, 333.
- of solutions (GETMAN and WILSON), A., ii, 1001.
- Refractive power** of diphenylhexatriene and allied hydrocarbons (SMEDLEY), T., 372.
- Refractometric researches** (EYKMAN), A., ii, 1.
- Refractometric studies** of some methane derivatives in which two or three atoms of hydrogen are replaced by negative radicles (HALLER and MÜLLER), A., ii, 445, 1001.
- Magnetic double refraction** of organic liquids (COTTON, MOUTON, and WEISS), A., ii, 2.
- Magnetic rotation** of the plane of polarisation, anomalous, of the rare earths (ELIAS), A., ii, 549.
- Rotation of the plane of polarisation**, natural and magnetic, in crystals (VOIGT and HONDA), A., ii, 912.
- Rotation**, influence of temperature change on, in solution (PATTERSON), T., 1836; P., 216.
- of optically active compounds, influence of solvents on (PATTERSON and THOMSON), T., 355; (PATTERSON and McDONALD), T., 936; P., 125; (PATTERSON), T., 1836; P., 216.
- Rotatory dispersion**, anomalous, a case of (DARMOIS), A., ii, 747.
- Rotatory polarisation** in crystals which are not enantiomorphous (SOMMERFELDT), A., ii, 339.
- Rotatory power** and chemical constitution, relation between (CHARDIN and SIKORSKY), A., ii, 470; (CHARDIN), A., ii, 548, 912.
- the relative influence of bi-, quadri-, and sexa-valent sulphur on (HILDITCH), T., 1618; P., 195.
- in solutions (PATTERSON), A., ii, 77.
- of amines of camphorcarboxylic acid (MINGUIN), A., ii, 137.
- of optically active ammonium compounds, effect of constitution on the (JONES and HILL), T., 295; P., 28.

PHOTOCHEMISTRY :—

- Rotatory power** of optically active nitrogen compounds, effect of constitution on the (EVERATT and JONES), T., 1789; P., 212.
- of organic substances (DEWAR and JONES), A., ii, 258.
- Magnetic rotatory power**, dispersion of, in the neighbourhood of bands of absorption in rare earths (BECQUEREL), A., ii, 647.
- Spectra**, wave-length tables of the, of elements and compounds (BRITISH ASSOCIATION REPORTS), A., ii, 334.
- regularities in the structure of (STAHL), A., ii, 445.
- of the discharge from a glowing lime cathode in mercury vapour (HORTON), A., ii, 745.
- of the alkali metals (RUNGE), A., ii, 78; (RITZ), A., ii, 445.
- of the alkali metals, the absolute distribution of intensity in the continuous background of the (LEDER), A., ii, 5.
- of some compound gases (GEHLHÖFF), A., ii, 11.
- of non-dissociated compounds (BECQUEREL), A., ii, 189.
- absorption, and chemical constitution, relation between (BALY and DESCH), T., 1747; P., 173; (BALY and SCHAEFER), T., 1808; P., 207; (BALY and TUCK), T., 1902; P., 223; (BALY and MARSDEN), T., 2108; P., 235; discussion, P., 236; (BALY, COLLIE, and WATSON), P., 268.
- influence of temperature and magnetisation on selective (DU BOIS and ELIAS), A., ii, 337, 547.
- influence of temperature changes on the, of solid substances (BECQUEREL), A., ii, 78.
- of the vapours of benzene and its homologues at different temperatures and pressures, and also of solutions of benzene (HARTLEY), A., ii, 243.
- of crystals of the rare earths and the changes which they undergo in a magnetic field at the temperatures of liquefaction and solidification of hydrogen (BECQUEREL and ONNES), A., ii, 338.
- of molten salts, influence of temperature and of the state of aggregation on (RETSCHINSKY), A., ii, 910.

PHOTOCHEMISTRY:—

- Spectra**, arc, presence of spark lines in (FAHEY and BUISSON), A., ii, 334.
- banded, energetics and chemistry of** (STARK), A., ii, 138, 545, 574.
- anomalous modifications of the, of different compounds in the magnetic field** (DUFOUR), A., ii, 138.
- fluorescence in** (STARK and STEUBING; LEY and V. ENGELHARDT), A., ii, 911.
- discontinuous cathode luminescence, of some aromatic compounds** (FISCHER), A., ii, 909.
- dissociation, quantitative indications furnished by** (DE GRAMONT), A., ii, 787.
- emission, cause of the, of the principal series lines of the alkali metals and the Doppler effect in canal- and anode-rays** (FREDENHAGEN), A., ii, 79.
- ultra-red emission, of the alkali metals** (BERGMANN), A., ii, 242, 336.
- some infra-red** (MOLL), A., ii, 241.
- infra-red reflection** (COBLENTZ), A., ii, 338.
- phosphorescent** (BECQUEREL), A., ii, 243.
- series, new law of** (RITZ), A., ii, 786.
- spark, of solutions, apparatus for the production of** (DE GRAMONT), A., ii, 3.
- Spectrum**, the Swan (v. WESENDONK), A., ii, 241.
- Zeeman phenomenon** (LOHMANN), A., ii, 152.
- Spectral lines** of barium, osmium, yttrium, and zirconium in a magnetic field, resolution of the (MOORE), A., ii, 138.
- Spectral series and atomic decomposition** (BERNOULLI), A., ii, 1001.
- Spectroscopic apparatus, modified** (BAXTER), A., ii, 337.
- Spectroscopic behaviour of hydrocarbons with conjugate ethylene linkings** (BRÜHL), A., ii, 1002.
- Spectroscopical investigation of isomeric nitro-compounds in the ultra-violet** (HEDLEY), A., i, 382.
- Spectrophotometer, König, new arrangement of the, and its application to the determination of chemical equilibria** (HILDEBRAND), A., ii, 646.
- Spectrum analysis, use of very low temperatures for** (BECQUEREL), A., ii, 3.
- Photographic action, films, image plates, and preparations.** See under Photochemistry.
- Photomethæmoglobin** (LEERS), A., i, 843.
- "Photo salts," Carey Lea's, simplest method of preparing** (LÜPPE-CRAMER), A., ii, 691.
- Phototropy of the fulgides and other substances** (STOBBE), A., ii, 339.
- Phthalacene and its oxide, structure of** (ERRERA), A., i, 183.
- Phthalacenic acid, structure of** (ERRERA), A., i, 184.
- Phthalacene** (ERRERA), A., i, 184.
- o*-Phthalaldehyde, action of Grignard's compounds on** (NELKEN and SIMONIS), A., i, 348.
- Phthalaldehyde-acid, tribromo-4-hydroxy-, and its methyl esters and methyl ether, and their acetyl derivatives, and anilide** (ZINCKE and BUFF), A., i, 644.
- Phthalamic-*p*-iodobenzylacetic acid** (WHEELER and CLAPP), A., i, 981.
- Phthalamino-,** See under the parent Substance.
- Phthalanil, 4-amino-** (BOGERT and RENSCHAW), A., i, 652.
- 3:5:6-tribromo-4-hydroxy-, and its salts and acetyl derivative** (ZINCKE and BUFF), A., i, 645.
- Phthalanilic acid, tribromo-4-hydroxy-** (ZINCKE and BUFF), A., i, 645.
- Phthaleins and their salts, reactions of** (ACREE), A., i, 423; (ACREE and SLAGLE), A., i, 653.
- salts, constitution of** (MEYER and MARX), A., i, 652.
- constitution of the salts of the, and the cause of the colour in the triphenylmethane series** (GREEN), P., 206.
- of mellitic and pyromellitic acids, constitution of the** (SILBERMAN), P., 209.
- Phthalic acid, nitration of** (HUISINGA), A., i, 985.
- Phthalic acid, glucinium salt** (TANABE and KUROWSKI), A., i, 758.
- Phthalic acid, 4-amino-, and its salts, and the carbamide and acyl derivatives of the methyl ester** (BOGERT and RENSCHAW), A., i, 652.
- 3:5:6-tribromo-4-hydroxy-, and its methyl hydrogen ester and dimethyl ester, and its acetyl derivative** (ZINCKE and BUFF), A., i, 646.
- 3-nitro-, formation of methyl esters of** (WEGSCHEIDER), A., i, 793.
- iso*Phthalic acid, nitration of** (HUISINGA), A., i, 985.

- Phthalic anhydride, action of, on resacetophenone (TORREY and BREWSTER), A., i, 427.
- Phthalic anhydride, 4-amino-, and its *N*-acetyl derivative (BOGERT and RENSHAW), A., i, 652.
- 3:5:6-tribromo-4-hydroxy-, and its salts, acetyl derivative, and phenylhydrazones (ZINCKE and BUFF), A., i, 645.
- Phthalic anhydride (BUCHER), A., i, 792.
- Phthalide, bromo-4-hydroxy-derivatives, and their acetyl derivatives (ZINCKE and BUFF), A., i, 644.
- Phthalides (MERMOD and SIMONIS), A., i, 342.
- Phthalidicarboxylic acid and its silver salt, formation of (CREETH and THORPE), T., 1512; P., 193.
- 2-Phthalide-5-methoxyphenoxyacetic acid, preparation of (PERKIN and ROBINSON), T., 511.
- Phthalimide, 4-amino-, and its hydrochloride (BOGERT and RENSHAW), A., i, 652.
- Phthalimino-3:5-*d*-bromobenzylmalonic acid, ethyl ester (WHEELER and CLAPP), A., i, 898.
- γ -Phthaliminobutyric acid and its derivatives (GABRIEL and COLMAN), A., i, 274.
- γ -Phthaliminobutyrophenone (GABRIEL and COLMAN), A., i, 275.
- ϵ -Phthalimino-hexonic acid and its chloride and -hexophenone (GABRIEL and COLMAN), A., i, 649.
- Phthalimino- β -hydroxyethylmalonic acid, lactone of, ethyl ester (SORENSEN and ANDERSEN), A., i, 650.
- Phthalimino-*p*-iodobenzylmalonic acid, ethyl ester (WHEELER and CLAPP), A., i, 981.
- 4-Phthaliminophthalic acid, methyl ester (BOGERT and RENSHAW), A., i, 652.
- Phthaliminopropiophenones, α - and β - (GABRIEL), A., i, 181.
- 8-Phthalimino-valeric acid and its chloride and -valerophenone (GABRIEL), A., i, 649.
- Phthalimethylimide, 4-amino- and 4-nitro- (BOGERT and RENSHAW), A., i, 652.
- Phthalonic acid, esterification of (WEGSCHIEDER), A., i, 793.
- Phthalonic anhydride phenylhydrazones (DIECKMANN and MEISER), A., i, 894.
- 4-Phthaloyl-3-methoxyphenoxyacetic acid (PERKIN and ROBINSON), T., 512.
- β -Phthalylalanine, α -bromo-, and its esters, and α -thiocyanato-, ethyl ester (GABRIEL), A., i, 181.
- Phthalylalanyl chlorides (GABRIEL), A., i, 181.
- Phylloporphyrin, simple method of preparing (MARCHLEWSKI and PIASECKI), A., i, 357.
- Phyllotaonin, conversion of, into phyto-rhodins (KOZNIIEWSKI and MARCHLEWSKI), A., i, 668.
- Phylloxanthin (MARCHLEWSKI), A., i, 99; (TSVETI), A., i, 668.
- Physical constants for non-associated liquids, new formulae correlating the (HIGGINS), A., ii, 668.
- Physiological action and chemical constitution, relation between, in certain substituted aminoalkyl esters (PYMAN), T., 1798; P., 208.
- of optical isomerides (CUSHNY), A., ii, 720.
- of substances of the saponin group (WACKER), A., ii, 771.
- Physiological actions, temperature velocities of (SNYDER), A., ii, 768.
- Physiological catalysis (LOEW), A., ii, 710.
- Physiological fluids, analysis of the lowering of the freezing point in (TEZNER), A., ii, 16; (TEZNER and ROSKA), A., ii, 810.
- Physostigmine. See Eserine.
- Phytase in animal tissues (MCCOLLUM and HART), A., ii, 713.
- which decomposes anhydro-oxymethylenediphosphoric acid (SUZUKI, YOSHIMURA, and TAKAISHI), A., i, 235.
- Phytelephas, carbohydrates of (IVANOFF), A., ii, 1064.
- Phytin in barley (WINDISCH), A., ii, 528.
- occurrence of, in plants (SUZUKI and YOSHIMURA), A., ii, 124.
- constitution of (NEUBERG), A., i, 394.
- constitution of, and production of inositol from (SUZUKI, YOSHIMURA, and TAKAISHI), A., i, 236.
- Phytohematin (PALLADIN), A., ii, 417.
- Phytorhodins, formation of, from phyllotaonin (KOZNIIEWSKI and MARCHLEWSKI), A., i, 668.
- Phytosterol, $C_{27}H_{44}O.H_2O$, and its acetyl derivative and dibromide; from laurel oil (MATTHES and SANDER), A., i, 418.
- Phytosterol from cotton-seed oil, and its dibromo-derivative and dibromoacetate (HEIDUSCHKA and GLOTH), A., i, 883.

- Phytosterol**, double linkings in, and its ozonide (MOLINARI and FENAROLI), A., i, 382.
- Phytosterols** from balata (COHEN), A., i, 883.
- from South African "rubber" (COHEN), A., i, 884.
- Phytosteryl acetate, tetrabromo-** (MATHES and ACKERMANN), A., i, 638.
- Picene**, alkyl derivative of (HOMER and PORVIS), T., 1325; P., 147.
- α -Picoline** (2-methylpyridine), chlorination of (SELL), T., 1993; P., 225.
- α -Picoline**, 6-hydroxy- (SIMONSEN), T., 1031.
- γ -Picoline**, condensation of, with α -nitrobenzaldehyde (LÖWENSOHN), A., i, 51.
- Picolinecarboxylic acid**, isolation of, from soils, and its relation to soil fertility (SCHREINER and SHOREY), A., ii, 889.
- Picolinic acid**, 3-amino- and 3-hydroxy- (KIRPAL), A., i, 565.
- 3,5-dichloro-, and its methyl ester and amide (SELL), T., 1995; P., 225.
- Picramide acetate**, α - and β -naphthylamines, and α - and β -naphthols (WITT and WITTE), A., i, 874.
- Picrates** (SUIDA), A., i, 523; (ANSELMINO), A., i, 879.
- Picric acid** solutions, conductivity of (GORKE), A., ii, 150.
- heat of neutralisation of, by different aromatic bases in benzene solution (VIGNON and ÉVIEUX), A., ii, 664.
- oxidation by means of (BACOVESCU), A., i, 825.
- molecular compounds of (GIBSON), T., 2098; P., 241.
- evaluation of (Utz), A., ii, 233.
- estimation of (BUSCH and BLEME), A., ii, 328.
- Picric acid**, metallic salts, and their hydrates and hydrazine salt (SILVERRAD and PHILLIPS), T., 474; P., 22.
- ammonium salt, isomeric modifications of (ANSELMINO), A., i, 879.
- Picrolonates** (WHEKLER and JAMIESON), A., i, 253.
- Picryl compounds**, fluorescence phenomena in (LEV, MÜLLER, and KRAFFT), A., i, 570.
- relation between the crystalline form and chemical constitution of (JERUSALSKY and POPP), A., ii, 674.
- Picrylphenyldiguanide** (LEV, MÜLLER, and KRAFFT), A., i, 571.
- Picryl- α -phenylenediamine** (LEEMANN and GRANDMOUGIN), A., i, 478.
- Picryl- m -toluidine** (LEEMANN and GRANDMOUGIN), A., i, 480.
- Picryl- β -triphenylguanylamidide** (LEV, MÜLLER, and KRAFFT), A., i, 571.
- Pigment** of yellow autumn leaves (TREVETT), A., i, 279.
- secretion of *Aphysia punctata*, spectroscopic and chemical behaviour of (PALADINO), A., ii, 53.
- Pigments**, decoloration of, in the visible spectrum (LAZAREFF), A., ii, 4.
- colloid nature of, in relation to their behaviour in the frog's kidney (HÖBER and CHASSIN), A., ii, 874.
- excretion of, by the urine (HÖBER and KEMPNER), A., ii, 716.
- respiratory, of plants (PALLADIN), A., ii, 416.
- urinary. See Urinary pigments.
- Pilolite** from the Pyrenees (FRIEDL), A., ii, 400.
- Pimelic acid**, electrolytic decomposition of (VANZETTI), A., i, 939.
- Pimelic acid**, α -diamino-, synthesis of, and its dibenzoyl derivative (SØRENSEN and ANDERSEN), A., i, 651.
- Pimpinellin** (HERZOG and HÁNCU), A., i, 905.
- Pinacolin** (methyl tert.-butyl ketone), solubility and reactions of (DELANCE), A., i, 762.
- relation of tetramethylethylene to (DELAERE), A., i, 243.
- Pinacone**, $C_{10}H_{20}O_2$ from 1-phenyl- Δ^2 -cyclopenten-3-one (BORSCHKE and MENZ), A., i, 148.
- Pinacone** hydrogen peroxide (TANATAR), A., i, 400.
- Pine tar oil**, Russian (SCHINDELMEISER), A., i, 95.
- Pine-wood**, chemical composition of (KLASON; KLASON and FAGERLIN), A., i, 717.
- Pinene**, hydration of (BARBER and GRIGNARD), A., i, 94.
- action of ozone on (HARRIES and NERESHEIMER), A., i, 194.
- oxidation products of (HENDERSON and HEILBRON), T., 288; P., 31.
- d -Pinene**, hydration of (SMIRNOFF), A., i, 278.
- γ -Pinene chloroxime**, action of piperidine on (GOLUBEFF), A., i, 802.
- β -Pinene** (nopinene), synthesis of, from nopinone (WALLACH), A., i, 297.
- Pinenedicarboxylic acid**, amino-, condensation of, with aspartic acid and with glycine (GODDEN), T., 1117; P., 144.
- Pinic acids**, active (BARBER and GRIGNARD), A., i, 852.

- Pinocampheol xanthate** (TSCHUGAEFF), A., i, 93.
- Pinocampnone dibromide** (SCHIMMEL & Co.), A., i, 667.
- Pinonic acid** (SCHIMMEL & Co.), A., i, 667.
- Pinonic acids, active, and their oximes** (BARBIER and GRIGNARD), A., i, 852.
- Pinus Jeffreyi*, resin of (TSCHIRCH and LEUCHTENBERGER), A., i, 196.
- Pinus palustris*, oil from. See Long leaf pine oil.
- Pinus serotina*, volatile oil of (HERTY and DICKSON), A., i, 435.
- 4-Pipecoline-3- α -dicarboxylic acids.** See Cincholenponic acids.
- Piperazine derivatives and pyrrole derivatives, synthesis of, from the three nitroanilines** (BORSCHÉ and TITSINGH), A., i, 103.
- arsenates and phosphates (ASTRUC and BRENTA), A., i, 919.
- Piperidine, 4-chloro-3-cyano-, hydrochloride of, and 3-cyano-, reactions of** (WOHL and LOSANITSCH), A., i, 47.
- Piperidine-3-aldehyde and its additive salts and diethylacetal and 4-chloro-, diethylacetal of, and its 1-benzoyl derivative, and dimethylacetal of** (WOHL and LOSANITSCH), A., i, 46.
- Piperidines, mutual solubility of, and water** (FLASCHNER), A., ii, 364.
- tertiary, formation of (v. BRAUN), A., i, 677.
- Piperidino-** See Piperidyl-.
- 4-Piperidylacetic acid, α -r-3-cyano-, and its hydrochloride** (WOHL and LOSANITSCH), A., i, 48.
- γ -Piperidylacetoacetic acid, ethyl ester, and its salts** (BENARY), A., i, 601.
- α -Piperidyl-acetonitrile, -n-butyronitrile, -n-hexonitrile, and -n-octonitrile and its hydrobromide** (v. BRAUN), A., i, 676.
- Piperidylacetophenone and its methiodide and their benzoyl derivatives** (RABE, SCHNEIDER, and BRAASCH), A., i, 361.
- Piperidylethyl benzoate and its additive salts and physiological action** (PYMAN), T., 1795; P., 208.
- phthalate and its additive salts (PYMAN), T., 1805; P., 208.
- salicylate and its hydrochloride (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 176.
- Piperidylmethylmandelamide** (EINHORN), A., i, 611.
- Piperil, action of thionyl chloride on** (BARGER and EWINS), T., 735; P., 60.
- Piper methysticum* (Kawa root) (WINZHEIMER), A., i, 804.
- Piperonal, condensation of, with benzidine, p-bromoaniline, m-nitroaniline, and p-phenylenediamine** (MOORE and GALE), A., i, 369.
- action of phosphorus pentachloride and of thionyl chloride on (BARGER), T., 572.
- Piperonalsynoxime, rate of inversion of, in inactive substances** (PATTERSON and McMILLAN), T., 1043; P., 185.
- Piperonyl alcohol, action of thionyl chloride on** (BARGER), T., 567.
- Piperonylacetone and its semicarbazone** (BÉHAL and TIFFENEAU), A., i, 631.
- Piperonylactaldehyde derivatives, preparation of** (WINZHEIMER), A., i, 656.
- Piperonylacrylic acid.** See Methylendioxybenzoylacrylic acid.
- γ -Piperonyl α crocotonic acid, α -hydroxy-** (BOUGAULT), A., i, 539.
- Piperonyleneacetone, identity of, with methystical, and its derivatives** (WINZHEIMER), A., i, 656.
- Piperonylidene-p-aminobenzoic acid, ethyl ester, p-chloroaniline, and p-toluidine and their monohydrochlorides** (MOORE and GALE), A., i, 369.
- Piperonylidene-p-aminodimethylaniline and its hydrochlorides** (MOORE and GALE), A., i, 369.
- Piperonylidenecarbamidoxime** (CONDUCHÉ), A., i, 154.
- Piperonylidenecinnamylideneacetone and its hydrochloride and bromides** (FRANCESCOINI and CUSMANO), A., i, 802.
- Piperonylidenemethystical** (WINZHEIMER), A., i, 805.
- Piperonylidenepyruvic acid, iodo-lactone from** (BOUGAULT), A., i, 539.
- Piperonyloin, action of thionyl chloride on** (BARGER and EWINS), T., 735; P., 60.
- Pipette, improved** (WORTHE), A., ii, 827.
- automatic syphon (BAILEY), A., ii, 827.
- and measuring vessel, rapid (SCHUBERT), A., ii, 424.
- and wash-bottle, combined (HOGARTH), A., ii, 981.
- Pisum sativum*. See Pea.
- Pitchblende, preparation of radium from** (PAWCEK), A., ii, 917.
- Pitchblende residue, treatment of** (HAITINGER and ULBICH), A., ii, 857.

- Pituitary** body, chemistry of the infundibular portion of the (ALDRICH), A., ii, 313.
 extract, duration of effect of, on blood pressure (MUMMERY and SYMES), A., ii, 767.
- Placenta**, nucleo-protein of the (SAVABÉ), A., i, 69.
- Planchette** from the French Congo (LACROIX), A., ii, 508.
- Plant** extracts containing chlorophyll, photodynamic action of (HAUSMANN), A., ii, 831.
 metabolism, toxic substances arising during (SCHREINER and SULLIVAN), A., ii, 422.
 nutrition, importance of the fixation of nitrogen in soil by free bacteria for (KOCH, LITZENDORFF, KRULL, and ALVES), A., ii, 56.
 roots, toxic substance excreted by (FLETCHER), A., ii, 617.
- Plants**, origin of the colouring matter of (LABORDE), A., ii, 774.
 mechanism of the distribution of odoriferous principles in (CHARABOT and LALOUE), A., ii, 774.
 effect of carbon disulphide on (EGOROW), A., ii, 421.
 influence of didymium and glucinum on (KANOMATA), A., ii, 616.
 effects of variations in inorganic salts and reaction on (MOORE, ROAF, and KNOWLES), A., ii, 768.
 absorption of varying amounts of lime and magnesia by (TAKEUCHI), A., ii, 624.
 behaviour of certain organic substances in (CIAMICIAN and RAVENNA), A., ii, 773.
 influence of micro-organisms on the utilisation of the potassium in leucite by (DE GRAZIA and CAMIOLA), A., ii, 415.
 in both water and sand cultures, effect of the addition of sodium to deficient amounts of potassium on the growth of (HARTWELL, WHEELER, and PEMBER), A., ii, 423.
 action of sulphur dioxide on (WIRLER), A., ii, 887.
 growing in solution cultures, power of sodium nitrate and calcium carbonate to decrease toxicity in conjunction with (SCHREINER and REED), A., ii, 420.
 the respiratory pigments of (PAL-LADIN), A., ii, 416.
 liberation of carbon dioxide by dead parts of (NABOKICH), A., ii, 616.
 function of calcium in (GRAFE and V. PORTHFIM), A., ii, 884.
- Plants**, chemical changes consequent on the wounding of (FRIEDRICH), A., ii, 774.
 occurrence of salts of anhydro-oxymethylenediphosphoric acid or phytin in (SUZUKI and YOSHIMURA), A., ii, 124.
 production and physiological rôle of pentosans in (CALABRESI), A., ii, 217.
 green, the protein changes taking place in, when kept in the dark (BUTKEWITSCH), A., ii, 884.
 photosynthesis of carbon dioxide by (EWART), A., ii, 217.
 hydrogen cyanide and the assimilation of nitrogen in (RAVENNA and PELLÉ), A., ii, 217.
 nitrate-reducing enzyme in (LIVING and HANKINSON), A., ii, 218.
 higher, influence of micro-organisms on the utilisation of the insoluble phosphates by (DE GRAZIA and CERZA), A., ii, 216.
 odoriferous, vegetation of (ROUËR-BERTRAND FILS), A., ii, 417.
 perennial, successive conditions of plant constituents during the normal development of a (ROUËR-BERTRAND FILS), A., ii, 417.
 detection of arbutin in (FICHTENHOLZ), A., ii, 995.
 employment of nitron for estimating nitrates in (LITZENDORFF), A., ii, 130.
- Plasma**, muscle. See Muscle plasma.
- Plastein** (SAWJALOFF), A., i, 234; (LEVENE and VAN STYKE), A., i, 932.
- Platinichlorides**, **Platinocyanides**, and **Platinous chloride**. See under **Platinum**.
- Platinum**, chemical decomposition of, by means of an alternating current (GROSS), A., ii, 199.
 change of density and specific heat of, after treatment, and the dependence of the specific heat on the temperature (SCHLETT), A., ii, 563.
 and arsenic, freezing point diagrams of the system (FRIEDRICH and LEROUX), A., ii, 300.
 oxidisability of (MARIE), A., ii, 209.
 passivity of (RUFER), A., ii, 601, 954.
 colloidal, reduction catalysis with (PAAL and GERICH), A., i, 599.
 and hydrogen, reduction with, at the ordinary temperature (WILLSTÄTTER and MAYER), A., i, 383, 636.
- Platinum alloys**, detection of ruthenium in (ORLOFF), A., ii, 231.
 with thallium (HACKSFILL), A., ii, 501.

- Platinum alloys** with tin (PODKOPÉEFF), A., ii, 391.
- Chloroplatinic acid**, preparation of, by electrolysis of platinum black (WEBER), A., ii, 391.
- Platinous chloride**, compounds of, with dicyclopentadiene (HOFMANN and v. NARBUTT), A., i, 519.
- Platinichlorides**, optical investigation of the condition of (HANTZSCH, CLARK, and MEYER), A., ii, 447.
- Platinocyanides** (LEVY), A., i, 252. fluorescence of (LEVY), T., 1446; P., 178.
- Platinum blue** (HOFMANN and BUGGE), A., i, 141.
- Platinum metals**, detection of, by the metaphosphate bead (DONAU), A., ii, 434.
- “explosive,” physico-chemical, researches on (COHEN and STRENGERS), A., ii, 299.
- Plumbago**, estimation of carbon in, by means of an electric furnace (JOHNSEN), A., ii, 630.
- Point discharge**. See under Electrochemistry.
- Poison**, cobra, action of, in destroying complement (MORGENROTH and KAYA), A., ii, 313.
- snake, hæmolytic by (v. DUNGERN and COCA), A., ii, 866.
- Poisons**, influence of certain, in the fibrillary contraction of the heart (WINTERBERG), A., ii, 521.
- action of, on enzymatic processes (SANTÉSSON), A., ii, 1061.
- of *Amanita Phalloides* (ABEL and FORD), A., ii, 1061.
- corrosive, *post-mortem* action of, in the stomach (HARNACK and HILDEBRANDT), A., ii, 1062.
- vegetable, detection of, in decomposed animal bodies (PANZER), A., ii, 997.
- See also Hæmolytic poisons.
- Poisoning** by atoxyl (BLUMENTHAL and HIRSCHMANN), A., ii, 613.
- by bismuth subnitrate (BÖHME), A., ii, 55.
- by bromobenzene, protein metabolism in (MARRIOTT and WOLF), A., ii, 123.
- cobra, and hæmolytic (BANG), A., ii, 721.
- by cresol (BLUMENTHAL and JACOBY), A., ii, 55.
- by lead and its detection (SCHMIDT), A., ii, 412.
- by oleic acid (FAUST), A., ii, 1062.
- by phosphorus, chemistry of (PORGES and PHIBRAM), A., ii, 721.
- Poisoning** by potassium chlorate (RIESS), A., ii, 1062.
- Polarimetric measurements and study**. See under Photochemistry.
- Polonium**, extraction of, and its properties (GIESEL), A., ii, 342; (MARCKWALD), A., ii, 454.
- α -particles, range of activity and absorption of (ASCHKINASS), A., ii, 920.
- rays (LATTÈS), A., ii, 796.
- Polyhydroxyaldehydes**, partially alkylated, preparation of (DREYFUS), A., i, 654.
- Polyiodides**, formation of, in nitrobenzene solution (DAWSON), T., 1303; P., 181; (DAWSON and JACKSON), T., 2063; P., 213.
- Polymerisation**, application of optical properties of liquids to the study of (ANDRÉEFF), A., ii, 547.
- Polymerorphism** (BARLOW and POPE), T., 1528; P., 193.
- of liquids (VORLÄNDER), A., ii, 22.
- Polynitro-compounds**, partial electrolytic reaction of, in presence of vanadium compounds (HOFER and JAKOB), A., i, 869.
- Polyoxymethylenes**, α -, β -, γ -, and δ - (AUERBACH and BARSCHALL), A., i, 131.
- Polypeptidephosphoric acid** (*paramucleic acid*) from caseinogen (REH), A., i, 69.
- Polypeptides**, synthesis of (FISCHER), A., i, 324, 544, 887; (ABDERHALDEN and GUGGENHEIM), A., i, 420, 535; (FISCHER and KROPP), A., i, 773; (KAY), A., i, 773; (FISCHER and HIRSZOWSKI), A., i, 887; (FISCHER and SCHEIBLER), A., i, 937; (FISCHER and CONE), A., i, 1004; (FISCHER and REIF), A., i, 1007.
- containing tryptophan (ABDERHALDEN and BAUMANN), A., i, 932.
- which contain tyrosine, action of tyrosinase on (ABDERHALDEN and GUGGENHEIM), A., i, 1030.
- course of the fermentative degradation of (ABDERHALDEN and KOELKER), A., i, 488.
- action of the juices expressed from cells on (ABDERHALDEN and LUSANA), A., i, 489.
- action of the juice of *Psalliotia campestris* on (ABDERHALDEN and RILLIET), A., i, 489.
- cleavage of (ABDERHALDEN and KOELKER), A., i, 293.
- behaviour of certain, towards the red corpuscles and platelets of ox-blood (ABDERHALDEN and MANWARING), A., ii, 510.

- Polypeptides**, behaviour of certain, towards the plasma of ox-blood (ABDERHALDEN and MCLESTER), A., ii, 511.
See also Amino-acids and Dipeptides.
- Polyphenols**, hydrogenation of (SABATIER and MAILHE), A., i, 529.
- Polyphosphates**. See under Phosphorus.
- Polysaccharides**, formulæ of (KILIANI), A., i, 320.
- Polysulphides**, inorganic, theory of (ERDMANN), A., ii, 582.
organic (HOLMBERG), A., i, 308.
- Porcelain**, hot, validity of Faraday's law in the electrolysis of (HABER, RIEFF, and VOGT), A., ii, 254.
- Positive electrons**. See under Electrochemistry.
- Potable water**. See under Water.
- Potash bulb**, new form of (HILL), P., 182.
- Potassium**, extraction of, from feldspathic rock (CUSHMAN and HUBBARD), A., ii, 586.
radioactivity of (MCLENNAN and KENNEDY), A., ii, 750.
solutions of, in liquid ammonia (RUFF and ZEDNER), A., ii, 565.
as the source of helium in saline minerals (STRUTT), A., ii, 923.
physiological function of, in vegetable organs (STOKLASA), A., ii, 417.
- Potassium salts**, viscosity of solutions of (GETMAN), A., ii, 464.
action of, on photographic plates (LEVIN and RUEB), A., ii, 448.
reciprocal compounds of, with sodium salts (JANECKE), A., ii, 808, 840.
- Potassium ammonioantimonate** (FITZGERALD), A., ii, 114.
rhodium bromide, and chloride (GUTHRIER and HÜTTLINGER), A., ii, 200.
hydrogen carbonate, reaction of, with magnesium carbonate and water (BÜCHNER), A., ii, 181.
chlorate, action of, on hauerite and pyrites (SPEZIA), A., ii, 861.
poisoning with (RIESS), A., ii, 1062.
perchlorate, detection of, in potassium chlorate (KLOBBE and VISSER), A., ii, 627.
chloride, solubility of, in aqueous pyridine at 10° (SCHROEDER), A., ii, 277.
influence of, on the solubility of calcium hydroxide, and vice versa (KEISNOT, D'AGOSTINO, and PELLEGRINO), A., ii, 568.
magnesium oxychloride formed by electrolysis of the residual solutions from the manufacture of, and its importance for the preparation of bromine (HOF), A., ii, 946.
- Potassium platinichloride**, solubility of (ARCHIBALD, WILCOX, and BUCKLEY), A., ii, 492.
chromates, behaviour of, at high temperatures (GROSCHUFF), A., ii, 501.
dichromate, crystallisation of (MIERS), A., ii, 388.
estimation of, in milk (GOUTRE), A., ii, 325.
calcium chromate, dimorphism of (KAKOWSKI), A., ii, 674.
hydroxide, alcoholic solution, preparation of a colourless (HALLA), A., ii, 944.
preparation of, which will keep (HABE), A., ii, 689.
preparation and apparatus for storing it (SCHOLL), A., ii, 425.
action of, on ketones (MONTAGNE), A., i, 988.
periodate, specific gravity and solubility of (BARKER), T., 16.
iodide, viscosity of non-aqueous solutions of (GETMAN), A., ii, 668.
solubility of, in water, and of water in, at low temperatures (KREMANNS and KERSCHBAUM), A., ii, 87.
action of, on antimonie acid in presence of hydrochloric acid (KOLB and FORMHALS), A., ii, 569.
reaction between potassium ferricyanide and (JUST), A., ii, 825.
effect of, on pyralin (NEILSON and TERRY), A., ii, 612.
cubes, rapid valuation of (FLORA), A., ii, 785.
double salts of, with mercuric iodide and dimercuriodocampher in organic solvents (MARSH and STRUTHENS), P., 266.
lead periodide, Wells', composition and formula of (MELDRUM), P., 97.
polyiodide (LAMI), A., ii, 782.
polyiodides (FOOTE and CHALKER), A., ii, 586.
permanganate, reduction of solutions of, acidified with sulphuric acid in presence of mineral acids (WARYNSKI and TCHERICHVILI), A., ii, 936.
nitrate, crystallisation of (JONES), T., 1740; P., 196.
polymorphism of (BARLOW and POPE), T., 1548.
nitrite, molecular volume of (BÄY), T., 999; P., 75.
lead nitrites, complex (MELDRUM), P., 97.
aluminium silicates (WEYBERG), A., ii, 697.
thorium silicate (DUBOIS), A., ii, 298.

- Potassium** silver silicomolybdate (COR-AUX), A., ii, 879.
 sulphate and magnesium sulphate system (NACKEN), A., ii, 693.
 compound of, with arsenic sulphate (KÜHL), A., ii, 36.
 copper and cadmium calcium sulphates (D'ANS), A., ii, 590.
 acid sulphates (ARZALLIER), A., ii, 763.
 sulphide, compound of, with nickel sulphide (I. and L. BELLUCCI), A., ii, 196.
 sulphite, action of, on potassium tetrathionate in aqueous solution (COLEFAX), T., 798.
 and potassium pentathionate, the reaction between (DIVERS), P., 122.
 thioantimonates (DONK), A., ii, 763, 859.
 trithionate (MACKENZIE and MARSHALL), T., 1732; P., 199.
 tetrathionate, action of potassium sulphite on, in aqueous solution (COLEFAX), T., 798.
Potassium cyanide, reaction of, with *o*-nitrobenzaldehyde (EKECRANTZ and AHLQVIST), A., i, 847; (POPOVICI), A., i, 550.
 influence of, on nitrogen excretion in dogs (WELKER), A., ii, 411.
 influence of, on protein metabolism (RICHARDS and WALLACE), A., ii, 214.
 influence of, on the respiration of *Aspergillus niger*, with remarks on the mechanism of the action of hydrocyanic acid (SCHROEDER), A., ii, 413.
 ferricyanide, reaction between potassium iodide and (JUST), A., ii, 825.
 ferrocyanide, conditions of equilibrium in the system, ferric chloride, water, and (VOLSCHIN), A., ii, 468.
 estimation of, volumetrically (BOLLENBACH), A., ii, 998.
 thiocyanate, reaction between ferric chloride and (BONGIOVANNI), A., i, 770, 859.
 action of imide chlorides on (JOHNSON and STOREY), A., i, 837.
Potassium, volumetric estimation of, as the cobaltinitrite (DRUSHEL), A., ii, 66.
 estimation of, by the platinichloride method (DE VRIES), A., ii, 430, 584.
 estimation of, in dung, manures, soils, and vegetable substances (SCHENKE), A., ii, 321.
 estimation of, in silicates (AUTENRIETH), A., ii, 897.
Potassium and sodium, estimation of, in silicates (THOMSEN), A., ii, 431.
 estimation of, in soils (RONNET), A., ii, 534.
 application of the cobaltinitrite method to the estimation of, in soils (DRUSHEL), A., ii, 735.
Potassium salt deposits, physico-chemical and mineralogical investigations of the occurrence of bromine and iodine in the (BOEKE), A., ii, 505.
Potatoes, manuring experiments with calcium cyanamide on (STUTZER), A., ii, 726.
 action of manganese compounds on (GRÉGOIRE, HENDRICK, and CARPIAUX), A., ii, 529.
 sodium nitrate compared with ammonium sulphate for (BAESSLER), A., ii, 127.
Potential differences. See under Electrochemistry.
Pozzuolana and mortar, microscopic study of (GALLO), A., ii, 844.
Praseodymium salts, borax bead test for (MILBAUER), A., ii, 70.
Praseodymium fluoride (POPOVICI), A., ii, 283.
Prasindones (KEHRMANN and SCHWARZENBACH), A., i, 297.
Precious stones, coloration of certain, under radioactive influences (BERTHELOT), A., ii, 8.
 of the family of aluminides, formation of (BORDAS), A., ii, 191.
 action of radium bromide on (BORDAS), A., ii, 8.
Precipitates, possibility of determining the mass of, by observation of their rates of settling (KOHN), A., ii, 92.
 inclusion of soluble substances by certain (FRION), A., ii, 477.
Pregnancy, amino-acids in urine during (VAN LEERSUM), A., ii, 715.
Pressure and temperature in relation to orthobaric volumes (HAIGH; YOUNG), A., ii, 813.
Pressures, apparent deviations from Mariotte's law and their influence on the measurement of small (SCHEEL and HEUSE), A., ii, 1016.
Pressure cylinder, new (PYL and LINNE), A., ii, 270.
Proline (*pyrrolidine-2-carboxylic acid*), synthesis of (SØRENSEN and ANDERSEN), A., i, 675.
 derivatives of (FISCHER and REIF), A., i, 1007.
Prolines, isomeric hydroxy-, and their derivatives (LEUCHS and FELSER), A., i, 510.

- Propyl-leucine anhydride** (FISCHER and REIF), A., i, 1008.
- Propaldehyde, α -amino-, *p*-nitrophenylosazone** of (NEUBERG), A., i, 823.
- Propaldehydymethylacetal, α -bromo- and β -iodo-** (WOHL and SCHWEITZER), A., i, 942.
- Propane**, oxygenated acyclic derivatives of (WOHL, SCHWEITZER, KÖPPEN, ROTH, and LANGE), A., i, 941.
- cycloPropane (trimethylene)**, preparation of (HAEHN), A., i, 14; (GUSTAVSON), A., i, 82.
- derivatives, formation of (GUTHZEIT and LOBECK), A., i, 129.
- formation of, from cyclobutane derivatives (DEMJANOFF), A., i, 85.
- ring, scission of the, by catalytic reduction (ZELINSKY), A., i, 15.
- Propanedicarboxylic acids**. See Dimethylmalonic acid and Glutaric acid.
- Propanetetracarboxylic acid, $\alpha\gamma$ -di-bromo- and $\alpha\gamma$ -dichloro-, methyl esters** (GUTHZEIT and LOBECK), A., i, 129.
- See also Dicarboxyglutaric acid.
- cycloPropanetetracarboxylic acid** and its esters and amide, formation of (GUTHZEIT and LOBECK), A., i, 129.
- Propanetricarboxylic acid**. See Tricarballic acid.
- Propargyl alcohol (propinol)**, hydrate, phenylurethane, and iodo-derivatives of (LESPIEAU), A., i, 496.
- Propargylcarbinol** (LESPIEAU and PARISSELLE), A., i, 496.
- ψ -Propenylanisoles, *o*- and *p*-** (BÉHAL and TIFFENEAU), A., i, 261.
- p*-Propenylphenetole**, synthesis of, and its dibromide (BÉHAL and TIFFENEAU), A., i, 260.
- p*- ψ -Propenylphenetole** and its dimeride (BÉHAL and TIFFENEAU), A., i, 262.
- p*-Propenylphenol**, synthesis of (BÉHAL and TIFFENEAU), A., i, 260.
- o*- ψ -Propenylphenol** (BÉHAL and TIFFENEAU), A., i, 261.
- Propenyltetramethyl-*m*-phenylenediamine** and its picrate (SACHS and APFENZELLER), A., i, 188.
- Propenylphenetrole**, synthesis of (BÉHAL and TIFFENEAU), A., i, 260.
- Propinol**. See Propargyl alcohol.
- Propionic acid**, vapour density of (FAUCON), A., i, 310.
- heat of vaporisation of (FAUCON), A., ii, 257.
- Propionic acid**, complex chromium salts (WEINER, GOVANOVIĆ, ASCHKINASY, and FUSSELL), A., i, 936.
- Propionic acid**, ethyl ester, azoinides of (FORSTER and FIEBZ), T., 569; P., 54.
- Propionic acid, amino-**. See Alanines.
- α -bromo-, ethyl ester**, condensation of, with cyclohexanones (WALLACH, EVANS, and MENDELSSOHN-BARTHOLODY), A., i, 403.
- α -bromo- and α -chloro-, glucinum salts** (GLASMANN and NOVICKY), A., i, 121.
- α -hydroxy-**. See Lactic acid.
- d*-Propionic acid, α -iodo-** (ABDERHALDEN and GUGGENHEIM), A., i, 887.
- Propionitrile**, additive compound of, with silicon tetrabromide (REYNOLDS), P., 280.
- Propionitrile**, chloro-, preparation of (BERGELL and FRIEL), A., i, 140.
- l*-Propionoxyisatin** (HELLER and SCHULIS), A., i, 208.
- Propionyl chloride, α - and β -chloro-**, and their *p*-toluidides (WOLFFENSTEIN and ROLLE), A., i, 282.
- d*-Propionyl chloride, α -iodo-** (ABDERHALDEN and GUGGENHEIM), A., i, 885.
- Propionylamino-**. See under the parent Substance.
- Propionylbenzylpropionic acid**, ethyl ester (DIECKMANN and KRON), A., i, 389.
- γ -Propionylbutyric acid** and its esters, oxime, and semicarbazone (BLAISE and MAIRE), A., i, 392.
- Propionyldiglycylglycine** and its ethyl ester, α -bromo- (FISCHER), A., i, 325.
- d*-Propionyldiglycylglycine, α -bromo-** (ABDERHALDEN and HIRSZOWSKI), A., i, 888.
- Propionylethylmalonic acid** and its ethyl ester and its semicarbazone (BLAISE and MAIRE), A., i, 391.
- Propionylglycine, *d*-bromo-** (FISCHER), A., i, 324.
- Propionylglycylglycine, *d*- α -bromo-** (FISCHER), A., i, 325.
- Propionylimino- γ -heptanecarboxylic acid**, attempt to synthesise (STABM-KOFF), A., i, 265.
- 3-Propionyl-1-methyl- Δ^2 -cyclohexene** and its semicarbazone (WALLACH and RENTSCHLER), A., i, 405.
- Propionylphosphamic chloride, di- α -chloro-** (STEINKOFF and BENEDER), A., i, 963.
- S*-Propionylpropionic acid** and its semicarbazone and ethyl ester (MAIRE), A., i, 248.
- Propionyltropine, $\alpha\beta$ -dibromo- and α - and β -chloro-**, and their additive salts (WOLFFENSTEIN and ROLLE), A., i, 282.

- d*-Propionyl-*l*-tyrosine, α -bromo-, and its ethyl ester, and α -bromo- β -5-diiodo- (ABDERHALDEN and HIBSZOWSKI), A., i, 888.
- l*-Propionyl-*l*-tyrosine, iodo-derivatives (ABDERHALDEN and GUGGENHEIM), A., i, 887.
- Propionyl-*d*-valine, *d*- α -bromo- (FISCHER and SCHEIBLER), A., i, 958.
- Propiophenone, α - and β -amino-, salts of (GABRIEL), A., i, 181.
- Propiophenonyl-carbamide and -phenylthiocarbamide (GABRIEL), A., i, 181.
- Propyl alcohol, oxidation of, by a contact process (ORLOFF), A., i, 306.
- iso*Propyl alcohol, dichloro-, and its benzoyl derivative (WOHL and ROTH), A., i, 942.
- trichloro-, decomposition of (MOSSLER), A., i, 751.
- Propyl arsenite (LANG, MACKAY, and GORTNER), T., 1367; P., 150.
- chloride, action of ethylamine on (COMANUCCI and ARENA), A., i, 138.
- cuprocyanide (GUILLEMARD), A., i, 720.
- cyclo*Propylacetic acid and its salts (DEMANOFF and DOJARENKO), A., i, 156.
- r*- β -*iso*Propyladipic acid, preparation of (BLANC), A., i, 245.
- n*-Propylaminosacetal and its derivatives (PAUL and VAN GEMBEK), A., i, 511.
- n*-Propylanilopyrines, 2- and ψ -, and their derivatives (MICHAELIS and MIELECKE), A., i, 62.
- iso*Propyl β -butylsuccinic acids, isomeric, and their salts and anhydrides (FICHTER and GLASER), A., i, 660.
- iso*Propylcarbamide (CONDUCHÉ), A., i, 155.
- Propylcarbamylamine (GUILLEMARD), A., i, 719.
- Propylcatechol, dichloro-, cyclic carbonates of (BARGER), T., 2081; P., 237.
- Propyltrichlorosilane (MEIZNER), A., i, 967.
- 3-*n*-Propylcinnamic acid (SCHROETER and BUCHHOLZ), A., i, 170.
- 1-*iso*Propyldiphenyl-2:3'-dicarboxylic acid (or 3-*isopropyl*diphenyl-2':4'-dicarboxylic acid) and its methyl ester and silver salt (LUX), A., i, 874.
- Propylene ozonide (HARRIES and HAEFFNER), A., i, 846.
- Propylenediamine and ethylenediamine, compounds of, with chromium and cobalt salts (PETITFER, GASSMANN, and PIETSCH), A., i, 508.
- propylenedicarboxylic acid. See Mesaconic acid.
- n*-Propyl- Δ^1 -cyclohexene and its nitrosochloride, nitropiperidine, and methoxyloxime and semicarbazone (WALLACH, CHURCHILL, and RENTSCHLER), A., i, 405.
- iso*Propyl- Δ^1 -cyclohexene and its nitrosochloride and oxime (WALLACH and MALLISON), A., i, 406.
- 1-*iso*Propylcyclohexen-2-one and its semicarbazone (WALLACH and MALLISON), A., i, 406.
- 1-*iso*Propyl- Δ^1 - and - Δ^2 -cyclohexen-4-ones and their semicarbazones (WALLACH and HEYER), A., i, 425.
- iso*Propylideneacetone. See Mesityl oxide.
- Propylidenecyclohexane and its nitrosochloride, nitropiperidine, and methoxyloxime (WALLACH, CHURCHILL, and RENTSCHLER), A., i, 405.
- iso*Propylidenecyclohexane (WALLACH and MALLISON), A., i, 406.
- Propylidenephosphamic chloride, $\alpha\beta$ -trichloro- (STEINKOPF and BENEDEK), A., i, 963.
- 2-Propylimino-4-methyluracil, chloro- (MAJIMA), A., i, 223.
- iso*Propylmalonic acid, ethylester, sodium derivative, action of monochloromethyl ether on (SIMONSEN), T., 1777; P., 212.
- iso*Propylmalonic acid, β -hydroxy-, β -lactone of, from acetone and malonic acid, and its salts (MELDRUM), T., 598; P., 31.
- iso*Propyl methylvinyl ketone and its *p*-nitrophenylhydrazone and semicarbazone, and isomeride (BLAISE and HERMAN), A., i, 319.
- n*-Propylnaphthalenes, α - and β -, and their picrates (BARGELLINI and MELACINI), A., i, 775.
- 3-Propylisoxazoline (MAIRE), A., i, 290.
- γ -*iso*Propylpentane, β -iodo- (CLARKE), A., i, 493.
- iso*Propylcyclopentane, 3-amino- (BOUVEAULT and BLANC), A., i, 135.
- iso*Propylcyclopentane-3-carboxylamide (BOUVEAULT and BLANC), A., i, 135.
- γ -*iso*Propyl- β -pentanol (CLARKE), A., i, 493.
- iso*Propylcyclopentane-3-ol (BOUVEAULT and BLANC), A., i, 135.
- γ -*iso*Propyl- β -pentanone (ethylisopropylacetone) (CLARKE), A., i, 493.
- 1-*iso*Propylcyclopentane-2-one and its carboxylic acid and their semicarbazones (BOUVEAULT and LOCCUIN), A., i, 173.
- iso*Propylcyclopentane-3-one (BOUVEAULT and BLANC), A., i, 135.

- 1-isoPropylcyclopentan-2-one 3-carboxylic acid**, ethyl ester (BOUVEAULT and LOCQUIN), A., i, 178.
- 2-p-isoPropylphenyl-2:3-naphthaglyoxaline** and its additive salts, and 1-amino-, and its derivatives and compounds with aldehydes (FRANZEN and SCHREIERMANN), A., i, 293.
- α -cycloPropylpropylene** (HENRY), A., i, 881.
- 3-Propylpyrazoline** and its picrate and phenylcarbamide (MAIRE), A., i, 291.
- 4-Propylquinoline** and its additive salts (BLAISER and MATRE), A., i, 597.
- isoPropylquinoline**, new, and its picrate (VAN HOFF), A., i, 827.
- Propyltheophyllines**, *n*- and *iso*-, and their additive salts (SCHWABE), A., i, 45.
- β -isoPropylvaleric acid**, δ -bromo-, ethyl ester (BLANC), A., i, 245.
- β -isoPropylvalerolactone** and its hydrazino-derivative (BLANC), A., i, 245.
- Prosecretin** in relation to *diabetes mellitus* (BAINBRIDGE), A., ii, 213.
- Protagon** (CRAMER and WILSON), A., i, 234; (ROSENHEIM and TEBB), A., i, 488.
- optical activity of, and a new physical phenomenon observed in connexion with the optical activity of (ROSENHEIM and TEBB), A., ii, 879.
- Protamine** from salmon spermatozoa, composition of the (NELSON), A., i, 1030.
- from the spermatozoa of the Caspian sturgeon (MALENÜCK), A., i, 1030.
- from the thymus gland (NELSON), A., i, 1030.
- as a means of distinguishing primary from secondary protozoes (HUNTER), A., i, 488.
- Protamines**, chemistry of (MALENÜCK), A., i, 1030.
- compounds of, with other proteins (HUNTER), A., i, 71.
- Proteic acids** in blood (BROWIŃSKI), A., ii, 205.
- Protein**, a thermosoluble, said to be that of Bence-Jones, in urine (GRIMBERT), A., ii, 212; (GASCARD and DEVALMONT), A., ii, 519.
- peptones from (ROGOZIŃSKI), A., i, 487.
- autolytic and hydrolytic degradation of, under normal and pathological conditions (GLIKIN and LOEWY), A., ii, 714.
- absorption of (v. KÖRÖSV), A., ii, 960.
- assimilation of, introduced enterally (PRINGLE and CRAMER), A., ii, 709.
- Protein**, assimilation of, introduced parenterally (CRAMER), A., ii, 709.
- cleavage products, nutritive value of (ABDERHALDEN and LONDON), A., ii, 51; (ABDERHALDEN and OLINGER), A., ii, 961; (ABDERHALDEN), A., ii, 1051.
- constitution (HUGOUNENQ and MOREL), A., i, 706.
- decomposition, influence of nitrogen-free sources of energy on the rate of, by the organism (FALTA and GIGON; PARI), A., ii, 961.
- influence of the thyroid gland on the rate of (PARI), A., ii, 962.
- ferment of the gastric juice, action of alkalis on (TICHOMIROFF), A., ii, 404.
- formation in ripening seeds (WASSLIEFF), A., ii, 976.
- hydrolysis, quantitative measurement of, by "formaldehyde titration" (SØRENSEN), A., i, 115; (SØRENSEN and JESSEN-HANSEN), A., ii, 234.
- katabolism. See Katabolism.
- metabolism. See under Metabolism.
- nomenclature (REPORT OF A JOINT COMMITTEE OF THE AMERICAN PHYSIOLOGICAL SOCIETY and the AMERICAN SOCIETY OF BIOLOGICAL CHEMISTS), A., i, 301.
- precipitation, calorimetric investigation on (HERLITZKA), A., i, 706.
- putrefaction, fatty acids of (NEUBERG and ROSENBERG), A., i, 116.
- synthesis in animals (HENRIQUES), A., ii, 207.
- Proteins**, "specific dynamic action" of (LUSK), A., ii, 514; (ZUNTZ), A., ii, 606.
- changes in internal friction in, due to degradation (SCHÖRR), A., ii, 931.
- action in the dark of fluorescent substances on, and its reversibility (KUDO and JODLAUER), A., ii, 507.
- the so-called amidic nitrogen of the (SKRAUP and v. HARTD-STREMEYER), A., i, 584.
- new method of hydrolysis of, by means of hydrofluoric acid (HUGOUNENQ and MOREL), A., i, 706.
- hydrolysis of, in pepsin-acid solutions (BERG), A., i, 374.
- part played by alkali in the hydrolysis of, by trypsin (ROBERTSON and SCHMIDT), A., i, 813.
- leucine fraction from the hydrolysis of (EHRICH and WENDEL), A., i, 302.
- preparation of isoleucine from the hydrolytic products of (LEVENE and JACOBS), A., i, 375.

- Proteins**, action of nitrous acid on (TREVES and SALOMONE), A., i, 114.
 production of fat from (BOGDANOFF), A., ii, 206.
 and sulphur, the formation of hydrogen sulphide from (HILDEBRANDT), A., i, 709.
 rich in bases, digestion and absorption of (LONDON), A., ii, 870.
 digestion of, in the alimentary canal of the dog (ABDERHALDEN, LONDON, and OPPLER), A., ii, 514.
 behaviour of different, in the stomach and upper duodenum of the dog (LONDON and POLOWZOWA), A., ii, 960.
 influence of, on hæmolysis (MEYER), A., ii, 513.
 katabolism of (HOFMEISTER), A., i, 1026.
 amphoteric, compounds of salt ions with (PAULI and HANDOVSKY), A., i, 707.
 of egg yolk (PLIMMER), T., 1500; P., 190.
 of horse-serum (MELLANBY), A., ii, 117.
 iodised, absorption of (v. FÜRTH and FRIEDMANN), A., ii, 1050.
 of maize, hydrolysis of the (OSBOENE and CLAPP), A., i, 115.
 native, electrical charge of (FIELD and TRAGUE), A., ii, 118.
 of rice (ROSENHEIM and KAJIURA), A., ii, 317.
 vegetable, action of the enzymes of gastric and pancreatic juices on (STUTZER and MERRES), A., ii, 404.
 compounds of, with protamines (HUNTER), A., i, 71.
 new reaction of (BARDACH), A., ii, 332.
 colour reactions of (FLEIG), A., ii, 1080.
 chloroamine reaction of (CROSS, BEVAN, and BRIGGS), A., i, 374.
 detection of, by means of formaldehyde (v. LIEBERMANN), A., ii, 998.
 separation of (HASLAM), A., i, 71.
 See also Serum proteins.
- Proteose**, occurrence of, in blood and urine (BORCHARDT), A., ii, 957.
- Proteoses** in blood (FREUND), A., ii, 117, 512; (ABDERHALDEN), A., ii, 305.
 protamine as a means of distinguishing primary from secondary (HUNTER), A., i, 488.
- Protocatechualdehyde**, cyclic carbonate of (PAULY), A., i, 423.
- Protocatechualdehyde cyanohydrin** and its reduction (FARBWERKE FORM. MEISTER, LUCIUS, & BRÜNING), A., i, 418.
- Protocatechuic acid**, electrolytic oxidation of (A. G. and F. M. PERKIN), T., 1196; P., 149.
 cyclic carbonate, preparation of (PAULY), A., i, 423.
- Protocatechuic acid**, phenyl and methoxyphenyl esters, amide, and anilide (BARGER), T., 569.
- Protocurcumin methyl ether** (CLARKE and JACKSON), A., i, 670.
- Protopine** of Japanese *Corydalis* roots (MAKOSHI), A., i, 908.
- Protoplasmides**, hydrolysis of (ÉTARD and VILA), A., i, 68, 584.
- Proustite** from Colorado (VAN HORN), A., ii, 608.
- Prune**, compounds of, with amino-compounds, and its sulphate and picrate (GRANDMOUGIN and BODMER), A., i, 289, 572.
 hydroxy-, and its benzenesulphonyl ester (GRANDMOUGIN and BODMER), A., i, 290.
- Prunellide** (GRANDMOUGIN and BODMER), A., i, 289.
- Prunus Pseudo-cerasus* var. *Sieboldi*, new glucoside from the bark of (ASAHINA), A., i, 559.
- Pseudo-acids** and their sodium salts, possible constitutional formulae of (HALLER and MÜLLER), A., ii, 1001.
 and acids, comparison of, in pyridine solution (HANTZSCH and CALDWELL), A., ii, 21.
- Psylla wax** (SUNDVIK), A., i, 123.
- Psyllic acid** and its salts (SUNDVIK), A., i, 123.
- Ptyalin**, effect of potassium iodide on (NEILSON and TERRY), A., ii, 612.
- Pulegone**, action of amyl nitrite on, in presence of sodium ethoxide (CLARKE, LAPWORTH, and WECHSLER), T., 37.
 action of magnesium methyl iodide on (RUPE and EMMERICH), A., i, 556.
- iso***Pulegone**, hydrocarbon from (RUPE and EBERT), A., i, 663.
- Pulegoneacetal** (ARBUSOFF), A., i, 555.
- iso***Pulegonic acid**, oxime and semicarbazone of, and oxidation of the oxime (CLARKE, LAPWORTH, and WECHSLER), T., 38.
- $\alpha\beta$ -Pulenenone** and its semicarbazone and dichloro-, and its reduction product (AUWERS and HESSENLAND), A., i, 550.
- $\alpha\beta$ -Pulenenone**, dichloro-, conversion of, into Δ^{13} -dihydro-*p*-xylene (AUWERS and HESSENLAND), A., i, 551.
- $\beta\gamma$ -Pulenenone** (1:4:4-trimethyl- Δ^8 -cyclohexen-3-one) and its semicarbazone and dichloro-, and **$\beta\gamma$ -Pulenenol** (AUWERS and HESSENLAND), A., i, 550.

- Pulenone** (1:4:4-trimethylcyclohexan-3-one), 4-chloro-1:2-dihydroxy-, and its benzoyl derivative (AUWERS and HESSENLAND), A., i, 551.
 derivatives, synthesis of, from *o*-cresol (AUWERS and HESSENLAND), A., i, 550.
- Pump**, circulating (STOLTZENBERG), A., ii, 1028.
 laboratory (LUTHER), A., ii, 270.
 Sprengel vacuum, simple form of (POLLOCK), A., ii, 938.
- Purgatives**, saline. See Saline purgatives.
- Purine bases**, formation of pyrimidine derivatives from (STEUDEL), A., i, 66.
- Purpurogallincarboxylic acid** and its salts and tetramethyl ether, and the methyl ester of the ether (A. G. and F. M. PERKIN), T., 1188; P., 149.
- Purpurogallonecarboxylic acid** and its acetylation and tetramethyl ether, and the methyl ester of the ether (A. G. and F. M. PERKIN), T., 1190; P., 149.
- Pus**, detection of indole in (PORCHER), A., ii, 769.
- Putrefaction**, studies on (RITTGER), A., ii, 215.
 chemistry of (ACKERMANN), A., i, 10.
- Putrescine** (ACKERMANN), A., i, 10.
- Putridine** and its aurichloride (ACKERMANN), A., i, 10.
- Putrine** and its aurichloride (ACKERMANN), A., i, 10.
- Pyknometer**, new form of (BOUSFIELD), T., 679; P., 69.
 for small amounts of substances (FISCHER), A., i, 545.
- Pyramidone**. See 4-Dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone.
- spiro* **Pyran** derivatives, cyclic oxonium salts from (DECKER and FELSEK), A., i, 905.
- Pyranol salts** related to brazilein and haematein, synthesis and constitution of (PERKIN, ROBINSON, and TURNER), T., 1055; P., 148.
 from alkylated brazilein and haematein (ENGELS, PERKIN, and ROBINSON), T., 1147.
- Pyrazine** derivatives, formation of, from quinoxalines (GABRIEL and SONN), A., i, 60.
- Pyrazine**, 2-amino-, and its additive salts, and 3-carboxylic acid (GABRIEL and SONN), A., i, 60.
- Pyrazine-2:3-dicarboxylic acid** and its methyl ester, salts, anhydride, diamide, and imide (GABRIEL and SONN), A., i, 60.
- Pyrazines**, di-substituted, formation of (GABRIEL and LIECK), A., i, 464.
- Pyrazole series**, lactones of the (WOLFF and SCHREINER), A., i, 291.
- Pyrazolone** derivative, $C_{20}H_{23}O_3N_4$, from ethyl 4-phenyl-1:1-dimethylcyclohexane-2:6-dione-3:5-dicarboxylate (DIECKMANN and KRON), A., i, 359.
- Pyrazolones**, thio- (MICHAELIS, DULF, LEHMANN, and PANDER), A., i, 685.
- 3-Pyrazolones** (MICHAELIS, STIEGLER, and WILBERT), A., i, 208.
- Pyridazines**, synthesis of (PAUL and KUHN), A., i, 57.
- Pyridine**, some physico-chemical properties of mixtures of water and (HARTLEY, THOMAS, and APPLEBY, T., 538; P., 22; (DUNSTAN and THOLE), T., 561; P., 59.
 equilibrium in the system, silver nitrate and (KAHLENBERG and BREWER), A., ii, 469.
 compounds, absorption spectra of (PURVIS), A., ii, 745.
 with chromates (BRIGGS), A., ii, 113; (PARRAVANO and PASTA), A., ii, 294.
 with mercuric cyanide (SCHROEDER), A., i, 252.
 with molybdenum thiocyanate (ROSENHEIM and GARFINKEL), A., i, 615.
 additive, with silicon tetrabromide (REYNOLDS), P., 250.
 alkyl iodides and their conductivity (SCHALL), A., i, 736.
 cobalt and nickel thiocyanates, action of iodine on (PFEIFFER and TILGNER), A., i, 614.
 magnesium organic compounds, action of, on benzaldehyde (ODD), A., i, 27.
 methyl derivatives, chlorination of (SELL), T., 1993; P., 225.
 reaction of, with sodium hydrogen sulphite (BUCHERER and SCHIEKEL), A., i, 452.
- Pyridine**, 3:5-dichloro-, preparation and orientation of (SELL), T., 1997; P., 225.
 2:3:5-trichloro-, orientation of (SELL), T., 2001; P., 225.
 2-chloro-5-amino- (MILLS and WIDDOWS), T., 1379; P., 174.
 3:5-dichloro-2-amino-, formation of, and its platinum chloride, and 3:5-dichloro-2-hydroxy- (SELL), T., 2002; P., 226.
 dichloro-2-hydroxy-, formation of (SELL), T., 2000.
 3-hydroxy-, additive compound of, with chloroacetic acid (KREPAL), A., i, 681.
- Pyridineacetoacetic acid**, α -cyano-, ethyl ester, betaine of (BENART), A., i, 501.

- Pyridine bases**, use of, as halogen carriers (CROSS and COHEN), P., 15.
- Pyridinebetaine**, 3-hydroxy-, and its methyl ether (KIRPAL), A., ii, 436.
- Pyridine-2-carboxylic acid**. See Picolinic acid.
- Pyridine-3-carboxylic acid**. See Nicotinic acid.
- Pyridine-4-carboxylic acid**. See *iso*-Nicotinic acid.
- Pyridinecarboxylic acids**, 2:6-substituted, action of methyl iodide on (TURNAU), A., i, 912.
- Pyridinecarboxylic acids**, hydroxy-, betaines of (KIRPAL), A., i, 681.
- Pyridine-2:3-dicarboxylic acid**. See Quinolinic acid.
- Pyridine series**, new betaines of the (KIRPAL), A., i, 679.
- 2-Pyridone**, 5-amino-, synthesis of, and its *N*-benzoyl derivative (MILLS and WIDDOWS), T., 1381; P., 174.
- 2-Pyridyl benzoate**, 5-amino-, *N*-benzoyl derivative of (MILLS and WIDDOWS), T., 1383; P., 174.
- Pyrimidine derivatives in nucleic acid** (OSBORN and WEYL; LEVENE and MANDEL), A., i, 376.
- formation of, from purine bases (STUEDEL), A., i, 66.
- Pyrimidine**, 6-amino-, picolonate of (WHEELER and JAMIESON), A., i, 253.
- Pyrimidine synthesis**, Traube's (BAUM), A., i, 292.
- Pyrimidines** (JOHNSON and HEYL), A., i, 59; (JOHNSON), A., i, 692, 739; (WHEELER and LIDDLE), A., i, 692, 698; (JOHNS), A., i, 917; (JOHNSON, CLAPP, and MARTIN), A., i, 835; (JOHNSON, STOREY, and MCCOLLUM), A., i, 837; (WHEELER and JOHNS), A., i, 835; (JOHNSON and CLAPP), A., i, 931; (JOHNSON and DERBY), A., i, 1018.
- Pyrimines**, 4-keto-compounds of (MICHAELIS and ENGELHARDT), A., i, 918.
- p*-Pyrimines**, nitroso-compounds of (MICHAELIS, MIELECKE, and LUTZE), A., i, 61.
- Pyrites**, action of potassium chlorate on (SPERZA), A., ii, 861.
- estimation of copper in (REMONDINI), A., ii, 323.
- Pyrites crystals**, American (KRAUS and SCOTT), A., ii, 115.
- Pyrocatechol**. See Catechol.
- Pyrogallol**, hydrogenation of (SABATIER and MAILHE), A., i, 529.
- 1:3-dialkyl ethers, carbamates of, preparation of (BASLER CHEMISCHE FABRIK), A., i, 635.
- Pyrogallolaldehyde**, compound of, with aniline hydrochloride (GATTERMANN), A., i, 31.
- Pyromeconic acid** (3-hydroxy- γ -pyrone), constitution of halogenated compounds of (COMPAGNO), A., i, 280.
- Pyromellitic acid**, constitution of the phthaleins of (SILBERRAD), P., 209.
- iso*Pyromucic acid**, constitution of (BLAISE and GAULT), A., i, 714.
- Pyromucylacetic acid**. See Furfuroyl-acetic acid.
- γ -Pyrone**, 3-hydroxy-. See Pyromeconic acid.
- 2-Pyrone-6-carboxylic acid**, 3-hydroxy- (BLAISE and GAULT), A., i, 714.
- 4-Pyrone compounds**, formation of, from acetylenic acids (RUHEMANN), T., 431, 1281; P., 52, 177.
- Pyrones** and allied compounds, relation between absorption spectra and chemical constitution of (BALY, COLLIE, and WATSON), P., 268.
- Pyronone syntheses** by means of the "tertiary bases reaction" (WENCKIND and HAEUSSERMANN), A., i, 671.
- Pyrotartaric acid**, dibromo-, action of phenylhydrazine on (EICHTER, GUGGENHEIM, and BRASCH), A., i, 105.
- Pyrrhotite**, recent formation of (CORNU), A., ii, 396.
- Pyrrrole derivatives** and piperazine derivatives, synthesis of, from the three nitroanilines (BORSCHÉ and TITTINGH), A., i, 103.
- potassium derivative, action of silicochloroform on (REYNOLDS), P., 279.
- silicon compound of (REYNOLDS), P., 279.
- Pyrrroles**, reactions of (ANGELI and MARCHETTI), A., i, 207.
- Pyrrroles**, nitroso- (MORELLI and MARCHETTI), A., i, 363.
- Pyrrolidine-2-carboxylic acid**. See Proline.
- Pyrrolidone derivatives**, amino-, from mesityl oxide and from benzylideneacetone (KOHN), A., i, 829.
- Pyruvic acid**, ethyl ester, action of, on *p*-toluidine (SIMON), A., i, 687, 738.

Q.

- Quartz**, chalcedony, and opal, relation between (LEITMEIER), A., ii, 951.
- change of state in, at 570° (MÜGGE), A., ii, 302.
- Quartz tubes**. See Tubes.
- Quercetin** methyl and trimethyl ethers and their acetyl derivatives (WUNDERLICH), A., i, 659.

- Quercitol**, occurrence of (v. LIPPMANN), A., ii, 124.
- Quinaldine**. See 2-Methylquinoline.
- Quinoxalines**, pharmacology of the (HILDEBRANDT), A., ii, 877.
- 4-Quinoxalene** (4-hydroxyquinazoline), 7-nitro- (BOGERT and KLADER), A., i, 467.
- Quinoxalones** (BOGERT and KLADER), A., i, 466.
- Quinhydrone**, absorption spectra of, in a state of vapour and in solution (HARTLEY and LEONARD), P., 284.
- Quinic acid**, calcium and zinc salts (GORTER), A., i, 346.
- Quinine**, behaviour of, in the body (GROSSER), A., ii, 213.
- sulphate and acid persulphate (WOLFFENSTEIN and WOLFF), A., i, 283.
- disulphate, direct application of Kerner's and of Liebig-Hesse's process to (BIGINELLI), A., ii, 783.
- tannates. See under Tannic acid.
- test for (VONDRASEK), A., ii, 997.
- Quinizarin**, condensation of, with aromatic amines (GRANDMOUGIN), A., i, 808.
- diethyl-*p*-phenylenediamine and toluidine derivatives of (GRANDMOUGIN), A., i, 809.
- o*-**Quinocatechol** hemi-ether, *heptachloro*- (JACKSON and CARLETON), A., i, 428.
- o*-**Quinodimethylhemiacetatecatechol** ether, *heptachloro*, preparation of (JACKSON and CARLETON), A., i, 428.
- Quinol**, absorption spectra of, in a state of vapour and in solution (HARTLEY and LEONARD), P., 284.
- hydrogenation of (SABATIER and MAILHE), A., i, 529.
- experiments on the oxidation of (v. EULER and BOLIN), A., ii, 1021; (WOLFF), A., ii, 1022.
- reaction of diazonium salts with (ORTON and EVERATT), T., 1021; P., 118.
- action of fused potassium hydroxide on (BLANKSMA), A., i, 262.
- condensation products of (MEYER and WITTE), A., i, 670.
- and arbutin, differentiation between (LEMAIRE), A., ii, 328.
- dimethyl ether, sulphination of (SMILES and LE ROSSIGNOL), T., 760.
- Quinol**, *tetrachloro*- (*hydrochloroquinol*), preparation and purification of (BOUTEVIAULT), A., i, 190.
- Quinoline** and its mononitro-derivatives, nitration of (KAUFMANN and HUSSY), A., i, 565.
- reduction of, in presence of nickel oxide (PATIEFF), A., i, 332.
- Quinoline derivatives** (REMFRY and DECKER), A., i, 364.
- of the anthraquinone series, preparation of (FARWENGE VOEM. MEISTER, LUCIUS, & BRUNING), A., i, 365.
- mechanism of the synthesis of (SIMON), A., i, 687.
- alkyl iodides and their conductivity (SCHALL), A., i, 736.
- glyoxaline bisulphite, amino- (HINSBERG), A., i, 453.
- 8-mercaptan and its benzoyl derivative, ethyl ether, and disulphide, and their 5-bromo-derivative (EISINGER), A., i, 363.
- Quinoline**, amino-derivatives, reaction of, with 1-chloro-2:4-dinitrobenzene (MEIGEN, GARBS, MERKELEACH, and WICHERN), A., i, 560.
- 6-chloro-, additive salts of (VON-GRUCHTEN and HOFCHEN), A., i, 914.
- o*-hydroxy-, salts of, with polybasic acids (FRITZSCHE & Co.), A., i, 257.
- 2:4-di-hydroxy-. See 4-Oxycarboanil.
- 8-thiocyano- (EDINGER), A., i, 364.
- Quinolines**, mechanism of the reactions of Skraup and of Doebner and Miller in the formation of (BLAISE and MAIRE), A., i, 566.
- Quinoline bases**, action of acid esters on (SPADY), A., i, 915.
- Quinoline-6-carboxylic acid**, amide of, and its *N*-methylol derivative (EISINGER), A., i, 612.
- Quinoline-2-carboxylic chloride** (BESTHORN), A., i, 681.
- Quinoline-6-carboxylpiperidylmethylamide** and its hydrochloride (EISINGER), A., i, 612.
- Quinolinesulphonic acid**, 8-hydroxy-, and its salts, preparation of (FRITZSCHE & Co.), A., i, 208.
- Quinoline-5-sulphonic acid**, 8-hydroxy-, 7-iodo-, double ammonium salt of (GRIESE), A., i, 454.
- Quinoline-8-sulphonic acid** and 5-bromo-, and their chlorides (EDINGER), A., i, 363.
- Quinolinic acid** (*pyridine-2:3-dicarboxylic acid*), 3-methyl ester, decomposition of (KIRPAL), A., i, 565.
- Quinolylbenzotriazoles**, 5-nitro- (MEIGEN, GARBS, MERKELEACH, and WICHERN), A., i, 580.
- 2-Quinolyl phenyl ketone** (BESTHORN), A., i, 681.
- 4-Quinolyl phenyl ketone** (REMFRY and DECKER), A., i, 364.
- o*-**Quinomethylhemiacetatecatechol** ether, *heptachloro*, preparation of (JACKSON and CARLETON), A., i, 428.
- o*-**Quinone**. See *o*-Benzquinone.

- m*-**Quinone**. See *m*-Benzoquinone.
- p*-**Quinone**. See *p*-Benzoquinone.
- Quinone formation** (VIDAL), A., i, 902.
- Quinonedimethyl-di-immonium salts** (WILLSTÄTTER and PICCARD), A., i, 476.
- as-meri*-**Quinonedimethyl-di-immonium salts** (WILLSTÄTTER and PICCARD), A., i, 476, 915.
- Quinonehydrazones**, relation between, and *p*-hydroxyazo-compounds (BORSCHKE), A., i, 66.
- meri*-**Quinonessimines** (WILLSTÄTTER and PICCARD), A., i, 475, 915.
- Quinones and aldehydes**, preparation of (LANG), A., i, 350.
- aromatic, direct hydrogenation of (SABATIER and MAILHE), A., i, 278.
- binuclear, as chromogens (DECKER), A., i, 805.
- halochromism of (MEYER), A., i, 781; (KEHRMANN), A., i, 993.
- and their oximes of the benzene series, condensation of, with nitro-derivatives of phenylhydrazine (BORSCHKE), A., i, 66.
- Quinones**, halogen derivatives, action of α -benzoylphenylhydrazine on (MC-PHERSON and DUBOIS), A., i, 461.
- Quinonoid compounds** (WILLSTÄTTER and PICCARD), A., i, 475, 915; (KEHRMANN), A., i, 693; (WILLSTÄTTER and MÜLLER), A., i, 731.
- "**Quinonoid dyes**, binuclear" (DECKER), A., i, 805.
- Quinonoid sulpha-derivatives** (ZINCKE and BRUNE), A., i, 336.
- Quinoxaline derivatives**, formation of pyrazines from (GABRIEL and SONN), A., i, 60.
- Quinoxaline**, 2:3-dichloro- (MOTYLEWSKI), A., i, 371.
- hydroxy-derivatives (HINSBERG), A., i, 694.
- Quinoxalines**, relation of azines to (FISCHER and SCHINDLER), A., i, 221.
- R.**
- Rabbit**, the glycogenic changes in the placenta and the fetus of the pregnant (LOCKHEAD and CRAMER), A., ii, 710.
- Rabbits**, utilisation of the energy of provender as influenced by the temperature of the surroundings, and the nutritional condition of (USTJANZEFF and BOGAJEWSKY), A., ii, 962.
- degradation of 2:5-diketopiperazines in the organism of (ABDERHALDEN), A., ii, 521; (ABDERHALDEN and WACKER), A., ii, 1052.
- Rabies**, action of various chemical reagents on the virus of (FERMI), A., ii, 412.
- Racemic amines**. See Amines.
- amino-acids, resolution of, by yeast (EHRlich and WENDEL), A., i, 268.
- compounds, existence of, in the liquid state (DUNSTAN and THOLE), T., 1815; P., 213.
- triboluminescence of (GERNEZ), A., ii, 748.
- Racemisation**. See Autoracemisation.
- Racemism**, partial (LADENBURG and HERMANN), A., i, 364.
- Radioactive substances**, **Radioactivity**, **Radiation**, and **Rays**. See under Photochemistry.
- Radiobacter** and **azotobacter**, the chemical changes involved in the assimilation of free nitrogen by (STOKLASA), A., ii, 880; (STOKLASA, ERNEST, STRANAK, and VÍTEK), A., ii, 975.
- Radio-lead** (SZILÁRD), A., ii, 141.
- Radiology**. See under Photochemistry.
- Radiotellurium**. See Radium *P*.
- Radiothorium**, short-lived intermediate product between mesothorium and (HAHN), A., ii, 454.
- Radium** in Australian minerals (MAWSON and LABY), A., ii, 917.
- in deep sea sediments (JOLY), A., ii, 649.
- atomic weight of (WILDE), A., ii, 141, 1027; (THORPE), A., ii, 448.
- what is? (FAUST), A., ii, 245.
- production and origin of (RUTHERFORD), A., ii, 6.
- preparation of, from pitchblende (HAITINGER and ULRICH), A., ii, 857; (PAWECKI), A., ii, 917.
- atom, certain properties of the (RIECKE), A., ii, 6.
- life of (BOLTWOOD), A., ii, 551.
- and uranium, relation between (SODDY), A., ii, 919.
- heat developed by (v. SCHWEIDLER and HESS), A., ii, 919.
- energy of (BORODOWSKY), A., ii, 448.
- distribution in electric fields of the active deposits of (RUSS), A., ii, 552.
- emission of electricity from the induced activity of (DUANE), A., ii, 748.
- influence of, on the electrolytic conductivity of colloidal solutions (ZŁOBICKI), A., ii, 451.
- influence of, on the decomposition of hydriodic acid (CRIGHTON and MACKENZIE), A., ii, 450.
- action of, on the coloration of certain precious stones (BERTHELOT), A., ii, 8.

- Radium**, rate of production of helium from (DEWAR), A., ii, 921.
 formation of ozone by (NASINI and LEVI), A., ii, 793.
 emanation, spectrum of (CAMERON and RAMSAY), A., ii, 786; (RUTHERFORD and ROYDS), A., ii, 787.
 photographic impressions produced by (MUÑOZ DEL CASTILLO and DÍAZ DE RADA), A., ii, 749.
 volume of (RUTHERFORD), A., ii, 791.
 determination of the molecular weight of, by comparison of its rate of diffusion with that of mercury vapour (PERKINS), A., ii, 552.
 the initial change of the (SIDGWICK and TIZARD), P., 64.
 measurement of the absorption coefficients of, in solutions and mixtures (KOFER), A., ii, 80; (MUÑOZ DEL CASTILLO), A., ii, 749.
 direct action of, on copper and gold (PERMAN), T., 1775; P., 214.
 action of, on solutions of copper salts (CURIE and GLEDITSCH), A., ii, 793.
 action of, on water (CAMERON and RAMSAY), T., 966, 992; P., 132; 133; (RUTHERFORD and ROYDS), A., ii, 1006.
 chemical action of, on water and certain gases (CAMERON and RAMSAY), T., 966; P., 132.
 decay of, when dissolved in water (MOORE), A., ii, 651.
 condensation of water vapour in presence of (CURIE), A., ii, 7, 797.
 action of, in diabetes (POULSSON), A., ii, 1057.
 quantitative estimation of, in the atmosphere (EVE), A., ii, 7, 919; (ASHMAN; SATTERLY, A., ii, 918.
 α -particles, scattering of, by matter (GERBER), A., ii, 795.
 α -rays, the range of the (DUANE), A., ii, 553.
 secondary rays from the (DUANE), A., ii, 554.
 secondary rays, experiments on (STARKE), A., ii, 341.
 γ -rays, different kinds of, and the secondary γ -rays which they produce (KLEEMAN), A., ii, 553.
Radium bromide, action of, on precious stones of the family of aluminides (BOEDAS), A., ii, 8.
Radium-B and -C, decay of, at high temperatures (SCHMIDT), A., ii, 141; (MAKOWER and RUSS), A., ii, 449; (ENGLER), A., ii, 650.
Radium C, secondary γ -rays due to γ -rays of (EVE), A., ii, 795.
Radium D, E, F, occurrence of, in ordinary lead (ELSTER and GEITEL), A., ii, 449.
 separation of, from radio-lead (SILARD), A., ii, 141.
Raffinose, hydrolysis of, by acids and enzymes (ARMSTRONG and GLOVER), A., i, 712.
Rays. See under Photochemistry.
Reactions. See Affinity, chemical.
Red lead. See Tripbimic tetroxide under Lead.
Reducing sugars. See Sugars.
Reductase, rôle of, in alcoholic fermentation (PALLADIN), A., i, 589.
Reduction and oxidation of unsaturated organic compounds, catalytic reactions of (FOKIN), A., i, 311.
 with platinum and hydrogen at the ordinary temperature (WILLSTÄTER and MAYER), A., i, 323, 636.
Reflection spectra, infra-red. See under Photochemistry.
Reflux condenser. See Condenser.
Refraction and Refractive power. See under Photochemistry.
Refractometric analysis. See under Analysis.
Refractometric researches. See under Photochemistry.
Regulator, simple, for high pressure gas (LE ROSSIGNOL), A., ii, 827.
Renal calculi (ROWLANDS), A., ii, 770.
Rennet, action of, on human milk (BENEFELD), A., ii, 121; (FELD and WOLFGEMUTH), A., ii, 311; (EMEL), A., ii, 873.
Rennin (*chymosin*) and pepsin (GEWIS), A., i, 71; (BANG), A., i, 236.
 non-identity of, with pepsin (HAMMARSTEN), A., i, 588.
 probable chemical constitution of (SCALA), A., i, 236.
Renosulphuric acid (MANDEL and SEIBERG), A., i, 1029.
Reptiles, chemistry of the liver and muscle of (LYMAN), A., ii, 769.
Resacetophenone (2:4-dihydroxyacetophenone), action of phthalic anhydride on (TORREY and BEEVESTER), A., i, 427.
 derivatives (DAHSE), A., i, 552.
 dimethyl ether (PERRIN, ROBINSON, and TRISER), T., 1193.

- Resacetophenonecarboxylic acid**, synthesis of, and its esters and their hydrazones, and ethers (LIEBERMANN and LINDENBAUM), A., i, 549.
- Resacetophenonephenylhydrazone** and its derivatives (TORREY and KIPPER), A., i, 460.
- Resacetophenonesemicarbazone** (TORREY and KIPPER), A., i, 461.
- Residual affinity**. See under Affinity, chemical.
- Resin**, a false euphoridium (TSCHIRCH and LEUCHTENBERGER), A., i, 196.
of *Antiaris toxicaria* (WINDAUS and WELSCH), A., i, 903.
of *Pinus Jeffreyi* (TSCHIRCH and LEUCHTENBERGER), A., i, 196.
- Resins** from conifers (SCHKATELOFF), A., i, 816.
from turpentine, method of obtaining, and the preparation from them of lacrs, varnishes, &c. (ORLOFF), A., i, 815.
See also Copals, Guttulidia, and Scammony resins.
- Resin acid**, dextrorotatory (SCHKATELOFF), A., i, 890.
- Resin oil** (SCHULTZE), A., i, 356.
- Resodiacetophenone**, azine, acetyl, and benzoyl derivatives, and phenylhydrazones and their derivatives (TORREY and KIPPER), A., i, 461.
- Resoflavin** (HERZIG and EPSTEIN), A., i, 899.
and its analogue from gallic acid (HERZIG, TSCHERNE, EPSTEIN, and V. BRONNECK), A., i, 547.
- Resoquinone**. See *m*-Benzoquinone.
- Resorcinol**, melting point of (BENNETT), A., i, 529.
- azo-derivatives** of (ORTON and EVERATT), T., 1017; P., 118.
- diethyl ether (1:3-diethoxybenzene), 2:4-di- and 2:4:6-tri-nitro- (BLANKSMA), A., i, 158.
- dimethyl ether (1:3-dimethoxybenzene), 5-nitro-, nitration of (BLANKSMA), A., i, 979.
- 4:6-dinitro-2-cyano- (BLANKSMA), A., i, 271.
- resorcinol**, 2:4:6-tri-nitro-. See Styphnic acid.
- mono-* and *di*-nitroso-, successive preparation of, and of resorubrin (BARBERIO), A., i, 161.
- resorcyaldehyde** and chloro-, and their derivatives, synthesis of (GATTERMANN), A., i, 30.
- resorubrin**, successive preparation of *mono-* and *di*-nitrosoresorcinols and of (BARBERIO), A., i, 161.
- Respiration** and circulation, effects of excess of carbon dioxide and want of oxygen on (HILL and FLACK), A., ii, 706.
regulation of (SCOTT), A., ii, 865.
influence of oxygen on (PEMBREY and COOK), A., ii, 706.
anaerobic, without the formation of alcohol (KORTYTSCHIEFF), A., ii, 416.
Cheyne-Stokes (PEMBREY), A., ii, 204.
cutaneous (FRANCHINI and PRETI), A., ii, 509.
- Respiratory metabolism** of the isolated spinal cord of the frog (WIENERSTEIN), A., ii, 509.
- Respiratory tract**, absorption of poisonous gases by the (LEHMANN, WIENER, WILKE, and YAMADA), A., ii, 771.
- Retene**, structure of (LUX), A., i, 873.
- Reyerite** from Greenland (DOEGGILD), A., ii, 399.
- Rhamnose-*o*- and -*m*-nitrophenylhydrazones** (REGLAIRE), A., i, 1014.
- Rhamnosides** (SCHMIDT), A., i, 437.
Rhamnus Frangula and *R. Purshiana*, barks of (TSCHIRCH and POOL), A., ii, 886.
- Rhapontic acid** (HESSE), A., ii, 420.
- Rhapontigenin** and its triacetyl derivative and *iso*Rhapontigenin (HESSE), A., ii, 419.
- Rhapontin** and its penta- and hexa-acetyl derivatives (HESSE), A., ii, 419.
- Rhein** and its acetyl, sodium, and potassium derivatives (HESSE), A., i, 439.
- Rheum austriacum* and *R. Rhaponticum*, roots of (HESSE), A., ii, 418.
- Rhizocholic acid** and its salts (SCHRÖTTER, WEITZENBÖCK, and WITZ), A., i, 532; (SCHRÖTTER and WEITZENBÖCK), A., i, 636, 900.
nature and constitution of (SCHRÖTTER and WEITZENBÖCK), A., i, 900.
- Rhodanic acid**, 3-amino-, and its condensation with aldehydes (ANDREASCH), A., i, 684.
- Rhodanic acids**, substituted, and their condensation with aldehydes (ANDREASCH), A., i, 683.
- Rhodanides** of inorganic radicles, constitution and properties of (DIXON and TAYLOR), T., 2148; P., 238.
- Rhodaninacetic acid** (3-carboxymethyl-rhodanic acid, 4-keto-2-thiothiazolidine-3-acetic acid) and its esters (KÖRNER), A., i, 510.
and its salts, and its condensation with aldehydes (ANDREASCH), A., i, 684.
- Rhodium**, wave-length tables of the arc and spark spectra of (BRITISH ASSOCIATION REPORTS), A., ii, 334.

- Rhodium** halogen salts, double (GUTHRIER and HÜTLINGER), A., ii, 290.
- Rhodium crucible**, use of, in chemical operations (CROOKES), A., ii, 702.
- Rhodocladonic acid** (ZOFF), A., ii, 526.
- Rhodonite—wollastonite**, freezing point curve for the system (GINSBERG), A., ii, 842.
- Rhodophyllins** (WILLSTÄTTER and PFANNENSTIEL), A., i, 198.
- Rhodusites** from Asskys River, Siberia (ISKULL), A., ii, 401.
- Rhubarb** and allied substances, compounds from (HESSE), A., i, 438; ii, 418.
- Ribose**, isolation of (BLANKSMA and ALBERDA VAN KENSTEIN), A., i, 951.
- Rice**, proteins of (ROSENHEIM and KAJIURA), A., ii, 317.
- starch. See Starch.
- straw, composition of (TAKERUCHI), A., ii, 617.
- Rickets**, calcium metabolism in relation to (ARON), A., ii, 771.
- Rizopatronite** from Minasragra (BRAVO), A., ii, 703.
- Rock analyses**, estimation of ferrous oxide in (MAUZELIUS), A., ii, 533.
- Rock-rose oil** (HÄNSEL), A., i, 665.
- Rock salt**, blue (CORN), A., ii, 396.
- artificial dichroism of (SEIDENTOFF), A., ii, 4.
- Rocks**, influence of fine grinding on the water and ferrous iron content of (HILLEBRAND), A., ii, 778.
- estimation of small amounts of barium in (LANGLEY), A., ii, 985.
- Röntgen rays**. See under Photochemistry.
- Rongalite** (*sodium formaldehyde-sulphate*), bases, and formaldehyde (BINZ and ISAAC), A., i, 940.
- constitution of (ORLOFF), A., i, 132.
- Rongalitic acid**, bases, and formaldehyde (BINZ and ISAAC), A., i, 940.
- Rosamine**, the chromogen of the simplest (KEHRMANN and DENGLER), A., i, 1002.
- Rosindone**, constitution of (KEHRMANN and STERN), A., i, 220.
- iso*-**Rosindone**, constitution of (KEHRMANN and STERN), A., i, 220.
- Rosin spirit**, estimation of mineral oil in (ADAM), A., ii, 1075.
- Rosecyanin** and its salts, acetyl derivative, and methyl ether (CLARKE and JACKSON), A., i, 670.
- Rotation and Rotatory** dispersion, polarisation, and power. See under Photochemistry.
- Rotlerin** and its reactions (HEHRMANN), A., i, 99.
- Roussin's salts** (BELLUCCI and DE CESARIS), A., ii, 111.
- constitution of (CAMBI), A., ii, 11, 288.
- See also Ferronitrosulphides.
- Rubber**, Para, oxydase in (SPENCE), A., ii, 774.
- latex, influence of the medium on Brownian motions in (HENRI), A., ii, 760.
- See also Caoutchouc.
- Rubber tubing**, absorption of gases by (DITMAR), A., ii, 159.
- Rubidium** rhodium bromide and chloride (GUTHRIER and HÜTLINGER), A., ii, 200.
- dichromate (WYROUBOFF), A., ii, 181; (STORTENBEKER), A., ii, 194.
- iodate and periodate (BARKER), T., 15.
- polyiodides (FOOTE and CHALKER), A., ii, 586.
- nitrate, crystallisation of (JONES), T., 1742; P., 196.
- calcium sulphates (D'ANS and ZEH), A., ii, 104.
- trithionate (MACKENZIE and MARSHALL), T., 1735; P., 199.
- Rubidium** and caesium, estimation of (MACKENZIE and MARSHALL), T., 1735; P., 200.
- Rubidium syngenite** (D'ANS and ZEH), A., ii, 104.
- Rubrocruumin** and its acetyl derivative (CLARKE and JACKSON), A., i, 670.
- Ruby**, spectrum of the (MIEHE), A., ii, 139.
- Rae anemone**, abnormal biochemical products of (DEATTIE), A., ii, 1065.
- Rufquebracho acid** (NIERENSTEIN), A., i, 40.
- Ruthenium**, detection of, in platinum alloys (ORLOFF), A., ii, 231.
- Rutin** (SCHMIDT; WUNDERLICH), A., i, 438.
- from *Capparis spinosa* and *Glaberrima Alpinum* (WUNDERLICH), A., i, 536.
- from *Polygonum Fagopyrum*, and its acetyl derivative (WUNDERLICH), A., i, 559.
- Rye**, effect of commercial sodium nitrate on (DE GRAZIA), A., ii, 130.
- gliadin from. See under Gliadin.

S.

- Sabina ketone**, preparation and transformation of, and its semicarbazone (WALLACH and HEYER), A., i, 423.
- Saccharides**. See Disaccharides and Polysaccharides.

- Saccharimeters**, normal tubes for (ROUSSET), A., ii, 73; (PELLET), A., ii, 235.
- "**Saccharin**." See *o*-Benzoisulphinide.
- Saccharin** and alkali saccharinates (RIMBACH and HEITEN), A., i, 394.
- Saccharine liquids**, estimation of lactic acid in (LEGLER), A., ii, 438.
- Saccharinic acid**, alkali salts, and saccharin (RIMBACH and HEITEN), A., i, 394.
- iso***Saccharinic acid**, preparation of (KILIANI), A., i, 246.
- Saccharinic acids** (NEF), A., i, 8; (KILIANI), A., i, 128, 246.
- Saccharose**. See *Sucrose*.
- Saffron**, constituents of (PFYL and SCHEITZ), A., ii, 979.
- process for the valuation of (PFYL and SCHEITZ), A., ii, 997.
- Safranin series**, preparation of sulphonic acids of the (AKTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 225.
- Safranines** (BARBIER and SISLEY), A., i, 64, 225.
- Safraninones** containing aliphatic groups, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 225.
- iso***Safrole** and *di*- and *tri*-bromo-, action of phosphorus pentachloride on (HOERING and BAUM), A., i, 527.
- p*-**Safrole**, preparation and reduction of (BÉHAL and TIFFENEAU), A., i, 631.
- Sage oil** from Grasse (ROURE-BERTRAND FILS), A., i, 558.
- Saiodin**. See *Behenic acid*, iodo-, calcium salt.
- Sakuranin** and its acetyl and benzoyl derivatives from the bark of *Prunus pseudo-cerasus* var. *Sieboldi* and **Sakuranetin** (ASAHINA), A., i, 559.
- Sal ammoniac**. See *Ammonium chloride*.
- Salicin**, physiological action of (OMI; KUSUMOTO), A., ii, 613.
- Salicylaldehyde**, testing the purity of (KREIS), A., ii, 234.
- condensation of, with benzamide (TITHERLEY and MARPLES), T., 1933; P., 229.
- sodium derivative, and bromoethyl ether and its phenylhydrazone (HEIJING), A., ii, 357.
- Salicylaldoxime**, alkylation of (IRVINE and MOODIE), T., 102.
- Salicylic acid** (*o*-hydroxybenzoic acid), preparation of, from 2-cyclohexanol-1-carboxylic acid, and its 3-bromo-derivative (KÖTZ and GÖTZ), A., i, 173.
- Salicylic acid**, substances which play a part in the synthesis of (MOLL VAN CHARANTE), A., i, 175.
- action of ferric salts on (HOPFGARTNER), A., i, 891.
- resorbed, action of, on blood serum (JACOBY), A., ii, 512.
- influence of, on the opsonic functions of the serum (JACOBY and SCHÜTZE), A., ii, 511.
- azo-compounds of (GRANDMOUGIN and GUIBAN), A., i, 926; (GRANDMOUGIN and FREIMANN), A., i, 1024.
- hydrazine compound of (FRANZEN and EICHLER), A., i, 831.
- the supposed phenylhydrazone of (MEYER), A., i, 176.
- detection and estimation of, in foods (v. GENERSICH), A., ii, 906.
- and its methyl ester, estimation and separation of (GIBBS), A., ii, 906.
- separation of (BOUGAULT), A., ii, 738.
- Salicylic acid**, brucine and cinchonine salts, and their optical activity (HILDITCH), T., 1391; P., 186.
- copper salt, and the action of ammonia and pyridine on (LEY and ERLER), A., i, 177.
- glucinum salt (GLSMANN and NOVICKY), A., i, 121; (TANATAR and KUROVSKI), A., i, 758.
- sodium salt, behaviour of, in the organism (BALDONI), A., ii, 1060.
- Salicylic acid**, alkylaminoalkyl esters, preparation of (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 176.
- benzyl ester (BACON), A., i, 815.
- o*-bromoamyl ester (MERCK), A., i, 419.
- methyl ester, hydrolysis, and separation and estimation of (GIBBS), A., ii, 906.
- Salicylic acid**, 3-nitro-, methyl ester (KELLER), A., i, 285.
- 3- and 5-nitro-, and their barium salts (BRUNNER and MEILET), A., i, 177.
- thio-, preparation of (CASSELLA & Co.), A., i, 177.
- Salicylic acids**, homologous, synthesis of (MEERWEIN), A., i, 80.
- Salicylideneacetone** hydrochlorides (FRANCESCONI and CUSMANO), A., i, 803.
- p*-**Salicylideneaminodimethylaniline** and its hydrochlorides (MOORE and GALE), A., i, 369.
- Salicylidenebenzamidines**, isomeric, preparation of (TITHERLEY and MARPLES), T., 1939; P., 229.

- Salicylideneinnamylideneacetone** (FRANCESCONI and CUSMANO), A., i, 802.
- Salicylidenediamine**, di- and tri-benzoyl derivatives of (TITHERLEY and MARPLES), T., 1940; P., 229.
- Saline purgatives**, inefficiency of, when injected subcutaneously or intravenously (AUER), A., ii, 213.
- Saliva** and oxygen supply (CARLSON and MCLAN), A., ii, 118.
- effect of diet on the anolytic power of (NELSON and LEWIS), A., ii, 709.
- nitrites of, and their origin (VILLE and MESTREZAT), A., ii, 310.
- of the cat, dextrose in (CARLSON and RYAN), A., ii, 403.
- the diastase in (CARLSON and RYAN), A., ii, 606.
- human, origin of the saccharifying power of (MESTREZAT), A., ii, 605.
- detection of thiocyanic acid in (POL-LACCI), A., ii, 782.
- Salmon spermatozoa**, composition of the protamine from (NELSON), A., i, 1030.
- Salt**. See Rock salt and Sodium chloride.
- Salt formation**, examination of the conception of hydrogen ions in (LAW-WORTH), T., 2187; P., 275.
- Salt glycosuria**. See under Diabetes.
- Salts**, formation of, and basicity of acids (BRUNI), A., ii, 935, 1012.
- conductivity and ionisation of, in aqueous solutions at high temperatures (NOYES, MELCHER, COOPER, EASTMAN, and KATO), A., ii, 347.
- containing water of crystallisation, thermodynamics of (SCHOTTKY), A., ii, 1016.
- hydrolysis of (ROSENSTIEHL), A., ii, 164.
- electrometric determination of the hydrolysis of (DENHAM), T., 41.
- hydrolysis of, as illustrated by heats of neutralisation (VELEY), A., ii, 812.
- hydrolysis of, in solution; lecture experiment (VANZETTI), A., ii, 805.
- influence of, on hydrolysis, and the determination of hydration values (ARMSTRONG and CROFTERS), A., ii, 816.
- reciprocal pairs of (JÄNECKE), A., ii, 808, 841.
- abnormal (KORZYŃSKI), A., i, 977.
- complex, constitution of, and a criticism of Werner's theory (FRIED), T., 1696; P., 122.
- Salts**, inorganic, adsorption phenomenon of (WOHLERS), A., ii, 819.
- sparingly soluble, saturated aqueous solutions of; the amounts dissolved and their alteration with temperature (KOHLEAUSCH), A., ii, 814.
- See also Coloured salts and Metallic salts.
- Salvia Sclarea**, oil from (ROURE-BERTRAND FILS), A., i, 903.
- Samarium sulphide** (ERDMANN and WIRTH), A., ii, 695.
- Sandalwood**, oil from (ROURE-BERTRAND FILS), A., i, 558.
- tricycloSantalaldehyde**, preparation of pure, and its oxime (SEMMLER), A., i, 434.
- Santalene**, derivatives of (SEMMLER and BARTELT), A., i, 38.
- Santalols**, $C_{15}H_{24}O$, and their derivatives (SEMMLER), A., i, 433.
- Santalyl** camphorate, preparation of (RIEDEL), A., i, 664.
- ethoxyacetate (FARBENFABRIK VORM. F. BAYER & CO.), A., i, 429.
- phosphate and succinate (KNOX & CO.), A., i, 1000.
- Santene** (*norcamphene*), constitution and derivatives of (SEMMLER and BARTELT), A., i, 194, 195.
- and its derivatives (ASCHAN), A., i, 94.
- and its diketone, dioxime, and di-semicarbazone (SEMMLER), A., i, 38.
- and its glycol and their derivatives (SEMMLER and BARTELT), A., i, 355.
- Santenol** and its acetate and phenylurethane (ASCHAN), A., i, 94.
- Santonin** and its derivatives, action of hydrochloric acid on (FRANCESCONI and CUSMANO), A., i, 817.
- bromination of (WEDEKIND and KÖPFER), A., i, 189; (KLEIN), A., i, 429.
- action of free hydroxylamine on (FRANCESCONI and CUSMANO), A., i, 822.
- action of ozone on (BARCELLINI and GIALDINI), A., i, 315.
- oxidation products of (ANGELI and MARINO), A., i, 543.
- desmethyl*Santonin, mechanism of the formation of (FRANCESCONI and CUSMANO), A., i, 817.
- action of nitric acid on (BARCELLINI, D'ACONTO, and MARINO), A., i, 819.
- Santoninic acid** (FRANCESCONI and CUSMANO), A., i, 273; (ANGELI and MARINO), A., i, 543.

- Santoninoxime**, α - and β -hydroxylamino- and hydroxylammoniohydroxylamino-, and their benzylidene derivatives (FRANCESCONI and CUSMANO), A., i, 273.
- Sapogenin** from *Agrostemma Githago* and its derivatives (BRANDL), A., i, 818.
- Saponification**. See Hydrolysis under Affinity, chemical.
- Saponin** from the leaves of *Polyscias nodosa*, Forst, inversion products of (VAN DER HAAR), A., i, 904. (the hemolytic action of (MEYER), A., ii, 709.
- Saponin group**, physiological action of substances of the (WACKER), A., ii, 771.
- Sarcinæ** causing disease in beer (MISKOVSKÝ), A., ii, 526.
- Sarcoplastic acid**. See *d*-Lactic acid.
- Scammony resins**, analysis of (GUIGUES), A., ii, 995.
- Scandium** (CROOKES), A., ii, 695. wide distribution of, in the earth (EBERHARD), A., ii, 862.
- Scatole**. See 3-Methylindole.
- Schiff's bases**, coloured salts of (MOORE and GALE), A., i, 368; (MOORE and WOODBRIDGE), A., i, 686. reduction products of (ANSELMINO), A., i, 259.
- Schizans Melle*, oil of the leaves of (SCHIMMEL & Co.), A., i, 667.
- Schlippe's salt**. See Antimony pentasulphide.
- Scyllium stellare*, egg-shell of. See Egg-shell.
- Scyphocephalum Ochoco*, fat from the seeds of (LEWKOWITSCH), A., ii, 885.
- Sea**. See under Water.
- Sea-urchin's eggs**. See Eggs.
- Secretin** (v. FÜRTH and SCHWARZ), A., ii, 963.
- Seedlings**, influence of the concentration of sugar solutions on the respiration of (MAGE and NICOLAS), A., ii, 773.
- Seeds**, chemical processes accompanying the germination of (SCURTI and PARROZZANI), A., ii, 417. germinating and ungerminated, peptolytic enzymes in (ABDERHALDEN and DAMMHAHN), A., ii, 1065. ripening, protein formation in (WASSILIEFF), A., ii, 976.
- Selenic and Selenious acids and Selenites**. See under Selenium.
- Selenium** (OECHSNER DE CONINCK and RAYNAUD), A., ii, 483. anomalous behaviour of (RIES), A., ii, 343. and iodine (PELLINI and PEDRINA), A., ii, 833.
- Selenium compounds** with copper, lead, and with silver, freezing point diagrams of (FRIEDRICH and LEROUX), A., ii, 696.
- Selenium iodide** (PELLINI and PEDRINA), A., ii, 833.
- Selenic acid**, electrolytic formation of, from lead selenate (MATHERS), A., ii, 833.
- Selenites**, asymmetric, preparation of (MARINO), A., ii, 833.
- Thiocyanoselenious acid** (IWANOFF), A., i, 513; ii, 530.
- Selenides**, sulphides, and tellurides, aromatic, and their halogen additive compounds, melting and boiling points of (LYONS and BUSH), A., i, 417.
- Selenodiglycollamides**, new (FRERICHS and WILDT), A., i, 414.
- Diselenodiglycollamides**, new (FRERICHS and WILDT), A., i, 414.
- Diselenodiglycollic acid**, action of sodium hydroxide on derivatives of (FRERICHS and WILDT), A., i, 413.
- Selenocyanacetamides**, new (FRERICHS and WILDT), A., i, 414.
- Selenoxalic acid**, amides of, new (FRERICHS and WILDT), A., i, 414.
- Selenium**, estimation of (IWANOFF), A., i, 513; ii, 530.
- Selenonium bases**, aromatic (HILDITCH and SMILES), T., 1384.
- Semicarbazide**, action of, on unsaturated compounds (RUPE and HINTERLACH), A., i, 12.
- Semicalalysis** (COLSON), A., i, 435.
- Semi-electrolytes** (PRUD'HOMME), A., ii, 20.
- L-Serine**, conversion of, into the natural optically active cystine (FISCHER and KASKE), A., i, 325.
- Serum**, bactericidal action of normal (MUIR and BROWNING), A., ii, 959. influence of resolved salicylic acid on the opsonic functions of (JACOBY and SCHUTZE), A., ii, 511. salt free, changes of viscosity in (SCHORR), A., ii, 931. of the eel. See Eel's serum. See also Blood serum.
- Serum globulin**, applicability of the laws of amphoteric electrolytes to (ROBERTSON), A., i, 929.
- Serum proteins**, effect of acid and alkali on the osmotic pressure of (ADAMSON and ROAF), A., i, 1026. union of, with alkali (HENDERSON), A., i, 301.
- Sesamé oil**, colour reactions of, with aromatic aldehydes and with various sugars (FLEIG), A., ii, 994.

- Sesquiterpene**, $C_{15}H_{24}$, and its isomeride, in "olum cadinum" (LEPESCHKIN), A., i, 273, 557; (SCHINDELMEISER), A., i, 353.
- Sesquiterpenes** (DEUSSEN and LEWINSOHN), A., i, 353.
- Sewage purification**, bacterial formation of sulphates in (ROUCHY), A., ii, 1063.
- Sharks**, egg-cases of (HUSSAKOFF and WELKER), A., ii, 408.
- Silica**, Silicic acid, and Silicates. See under Silicon.
- Silicate glass**. See Glass.
- Silicate mixtures**, isomorphous, artificial production of (POSCHL), A., ii, 400.
- Silico-acids** and their derivatives (MELZER), A., i, 967.
- Silicobenzoic acid** and its ortho-ester (KHOTINSKY and SEREGENKOFF), A., i, 1032.
- Silicobutyric acid** and the ester of the ortho-acid (MELZER), A., i, 967.
- Silicochloroform**, action of, on potassium pyrrole (REYNOLDS), P., 279.
- Silico-2:4-dimethylbenzoic acid** and its ortho-ester (KHOTINSKY and SEREGENKOFF), A., i, 1032.
- Silicohexoic acid** and the ester of the ortho-acid (MELZER), A., i, 967.
- Siliciodoform** (RUFF), A., i, 965.
- Silicon**, ultra-violet spectrum of (DE GRAMONT and DE WATTEVILLE), A., ii, 909.
- the ultimate rays of (DE GRAMONT), A., ii, 645.
- as a reducing agent for the oxides of refractory metals (NEUMANN), A., ii, 377.
- Silicon alloys** with aluminium (FRAENKEL), A., ii, 592.
- with carbon and iron (GONTERMANN), A., ii, 551.
- with cobalt (LEWKONJA), A., ii, 553.
- with silver (ARRIVAUT), A., ii, 1035.
- Silicon compound** with cadmium (HACKSPILL), A., ii, 589.
- Silicon compounds** with aluminium and vanadium (MANCHOT and FISCHER), A., ii, 46.
- with molybdenum and tungsten (DEFACQZ), A., ii, 555.
- with palladium (LEBEAU and JOLIBOIS), A., ii, 602.
- Silicon tetrabromide**, additive compounds with acetonitrile, propionitrile, and pyridine (REYNOLDS), P., 280.
- carbide, formation of (PRING), T., 2104; P., 240.
- See also Carborundum.
- Silicon fluoride**, magnetic charges in the spectrum of, observed parallel to the field (DUFOUT), A., ii, 416.
- Silicofluoride**, hydroxylamine derivative (EBLER and SCHOTZ), A., ii, 1031.
- Silicon monoxide** (POTTER), A., ii, 277.
- dioxide (*silica*), precipitated by CHATELIER, A., ii, 1023.
- the polymorphous forms of (BARLOW and POPE), T., 1554.
- catalytic power of (SENDEKENS), A., ii, 166.
- reduction of, by carbon (GREENWOOD), T., 1492; P., 188.
- action of aluminium powder on (WESTON and ELLIS), A., ii, 255.
- and alumina, estimation of, in bauxites (TIMBY), A., ii, 533.
- separation of, from tungstic acid (DEFACQZ), A., ii, 537; (NEGLARDOT), A., ii, 1074.
- and alumina, precipitation of gelatinous mixtures of, and their relation to allophane, halloysite, and montmorillonite (STREMMER), A., ii, 1041.
- Silicic acid**, action of phosphoric acid on (HETTINGER), A., ii, 583.
- in Whartonian jelly (FRATZBERGER), A., ii, 969.
- Silicates**, molten, dissociation of (DOELTER), A., ii, 178, 859.
- estimation of potassium in (ARTRIEBH), A., ii, 897.
- estimation of potassium and sodium in (THOMSEN), A., ii, 431.
- See also Alkali silicates and Metasilicates.
- Silicic acids**, Tschermak's method of preparing, from natural silicates (MÜGGE), A., ii, 277, 611; (TSCHERMAK), A., ii, 490.
- obtained by Tschermak (VAN EMMELÉN), A., ii, 808.
- Silicon phosphide** (GEWECKE), A., ii, 597.
- sulphides and oxy-sulphides (RANKIN and REVINGTON), P., 131.
- Silicon organic compounds** MARSDEN and KIPPING), T., 198; P., 12; (ROBISON and KIPPING), T., 423; P., 25; (KIPPING), T., 457; P., 47; (LIFE and KIPPING), T., 2091, 2099; P., 224, 236; (REYNOLDS), P., 279, 289; (LADENBURG), A., i, 432; (RIFF and GEISEL), A., i, 966; (MELZER), A., i, 967; (KHOTINSKY and SEREGENKOFF), A., i, 1032.
- Silicon**, estimation of commercial; separation of silica and (LAMMER), A., ii, 131.

- Siliconaphthoic acids**, α - and β -, and their ortho-esters (KROTINSKY and SEREGENKOFF), A., i, 1032.
- Siliconitrogen hydride** (RUFF), A., i, 967.
- Silicophenylacetic acid** and the ester of the ortho-acid (MEIZER), A., i, 967.
- Silicotetrapyrrole** (REYNOLDS), P., 279.
- Silicostungstic acids**, preparation of (COPAUX), A., ii, 147.
- Silk worms**, composition of chrysalis oil from (TSUJIMOTO), A., ii, 517.
- Silver**, atomic weight of, according to Stas's experiments (DUBREUIL), A., ii, 1035.
- preparation of chemically-active, by electrolysis (TANANAEFF), A., ii, 377.
- colloidal (KOHLSCHÜTTER), A., ii, 182.
- hydrogel (*silver-gel*) in photographic films (LÜPPO-CRAMER), A., ii, 841, 943, 1024.
- colloidal solutions, viscosity of (WOODSTRA), A., ii, 466, 818.
- action of some electrolytes on (WOODSTRA), A., ii, 160; (LOTTERMOSER), A., ii, 365.
- grey, existence of different modifications of ordinary (PISSARJEWSKY), A., ii, 494.
- and its oxides, electrochemical behaviour of (LUTHER and POKORNÝ), A., ii, 277.
- electrochemical equivalent of, especially in reference to the so-called anode liquid (KOHLETSCH), A., ii, 657.
- electrolytic valve action of (SCHULZE), A., ii, 560.
- and selenium, freezing point diagram of (FRIEDRICH and LEROUX), A., ii, 696.
- partition of, between lead and zinc (POTDAR), A., ii, 945.
- reaction of, with nitric acid (STANSBIE), A., ii, 497.
- use of, in the combustion of nitrogenous substances (ERSTEIN and DOHT), A., ii, 132.
- Silver alloys** (PANNAIN), A., ii, 495.
- with silicon (ARRIVAUT), A., ii, 1035.
- Silver compounds**, quantitative indications furnished by the dissociation spectra of (DE GRAMONT), A., ii, 787.
- Silver salts**, decomposition of certain (ANGELI and MARCHELLE), A., ii, 841.
- toxicity of, to fishes (PICORINI), A., ii, 412.
- Silver chloride**, solubility of, in mercuric nitrate solution (BUTTE and HEWITT), T., 1405; P., 173.
- separation of, from silver iodide (BAUBIGNY), A., ii, 321.
- Silver ammonium chromate** (GRÖGER), A., ii, 691.
- halides, attempt to produce dichroism by pressure in (CORNU), A., ii, 647.
- and thiocyanate, relative solubilities of (HILL), A., ii, 378.
- sub*-halides (TRIVELLI), A., ii, 1036.
- iodide, solubility of, in ammonia (BAUBIGNY), A., ii, 691.
- adsorption of silver nitrate and potassium iodide by amorphous (LOTTERMOSER and ROTHE), A., ii, 364.
- nitrate, equilibrium in the system, pyridine and (KALLENBERG and BREWER), A., ii, 469.
- action of, on chloroauric acid (JACOBSEN), A., ii, 601.
- action of, on inorganic hydroxides (BILTZ and ZIMMERMANN), A., ii, 104.
- nitrite, molecular volume of (RÄV), T., 999; P., 75.
- oxide in ammoniacal solution, explosion of vessel containing (MATIGNON), A., ii, 587.
- reduction of, by hydrogen (KOHLSCHÜTTER), A., ii, 182.
- peroxide, so-called (BABOROVSKÝ and KIZMA), A., ii, 378.
- selenide, compounds of, with selenides of antimony, arsenic and bismuth (PELABON), A., ii, 587.
- potassium silicomolybdate (COPAUX), A., ii, 379.
- sulphate and silver sulphide, reaction between (SACKUR), A., ii, 1036.
- germanium sulphide. See Argyrodite.
- Silver**, new test for (GREGORY), P., 125.
- detection of, by the metaphosphate bead (DONAU), A., ii, 484.
- estimation of, volumetrically (LANG and WOODHOUSE), T., 1037; P., 122.
- copper, and lead, estimation of, in complicated organic salts (RINDL and SIMONIS), A., ii, 432.
- electrolytic separation of copper and (GILLET), A., ii, 226.
- quantitative separation of thallium from (SPENCER and LE PLA), T., 558; P., 75.
- Silver assaying**, apparatus for the prevention of acid fumes in (DARD), A., ii, 72.
- Silver and lead assays**, dry, in ores (LOEVY), A., ii, 323.
- Silver film**, transparent (TURNER), A., ii, 1034.
- Silver group**, microchemical analysis of the (SCHOORL), A., ii, 432.

- Simaruba bark**, constituents of (GILLING), A., ii, 527.
- Simplon**, radioactivity of the rocks of the railway line to the (GALLO), A., ii, 917.
- Sitosterol** and its phenylcarbamate, and oxidation products (PICKARD and YATES), T., 1928; P., 227.
- Slag**, basic, estimation of phosphoric acid in, by Grete's method (KETNER), A., ii, 64.
- Slag-ammonia**, basic, as manure (BACHMANN), A., ii, 624.
- Slags**, analysis of some (NAMIAS), A., ii, 326.
- Snake poison**. See Poison.
- Snow**, ionisation phenomena produced by (COSTANZO and NEGRO), A., ii, 551.
- fertilising value of (SHUTT), A., ii, 422.
- Soaps** considered as colloids, physico-chemical investigations on (MAYER, SCHEFFER, and TERROINE), A., ii, 264.
- hemolysis by (FRIEDEMANN and SACHS; SACHS), A., ii, 866.
- Soda felspar**. See Felspar.
- Soda industry**, electrolytic; theory of the Bell-chamber process (BUCHET), A., ii, 1034.
- Soda-lime apparatus** for organic analysis and carbon dioxide estimation (DENNSTEDT), A., ii, 225.
- Sodamide**, action of, on ketones (HALLER and BAUER), A., i, 987.
- Sodium** vapour, resonance spectra of (WOOD), A., ii, 546.
- fluorescence of (ZICKENDRAHT), A., ii, 910.
- thermo-electric power of (BURNINI), A., ii, 255.
- apparent molecular weight of, dissolved in liquid ammonia (KEATS), A., ii, 834.
- atom, existence of positive electrons in the Wood, A., ii, 159.
- solutions of, in liquid ammonia (RUFF and ZEDNER), A., ii, 555.
- use of, as a desiccating agent for gases (MATHONN), A., ii, 377.
- importance of, for sugar beet (ANDERLIK and URRAN), A., ii, 219.
- Sodium amalgam**, behaviour of, as electrodes in solutions of neutral salts (BYERS), A., ii, 926.
- Sodium salts**, reciprocal compounds of, with potassium salts (ANDERLIK), A., ii, 898, 840.
- Sodium dithionite**, action of sulphoacetic acid on (BARTHE), A., i, 271.
- perchlorate, preparation of (DEUTSCHE GELB- & SILBER-SCHMIDT ANSTALT), A., ii, 650.
- Sodium bromide and iodide**, esterase (PAAL and KÜHN), A., ii, 179.
- rhodium bromide and chloride, comparison of (HÜTTLINGER), A., ii, 200.
- carbonate, new reaction for the reduction of (CHRIST), A., ii, 190.
- and oxalic acid solutions, means of comparing (TIAN), A., ii, 985.
- hydrogen carbonate, carbon dioxide, sodium phosphate, and disodium phosphate, equilibrium between, at body temperature (HENDERSON and BLACK), A., ii, 467.
- hydrogen percarbonates, preparation of (MERCK), A., ii, 180.
- chloride, and barium and copper chlorides, and water, the system (SCHREINEMAKERS and DEBAAT), A., ii, 1020.
- and hydrochloric acid, chemical and physiological properties of a solution of (PETERS), A., ii, 411.
- colloidal (PAAL and KÜHN), A., ii, 179.
- excretion of, in phloisizin diatoms (BIBERFELD), A., ii, 972.
- See also Rock salt.
- chromosilicates (WEYBANG), A., ii, 857.
- fluoride in nepheline-syenite from Ls. Islands (LACROIX), A., ii, 290.
- and manganese sulphide, a reaction on anions (NAMBIA), A., ii, 625.
- detection of arsenic in, by means of the Gutzzeit and Flückiger reaction and the Marsh apparatus (VAN RYN), A., ii, 224.
- hydrosulphide and thiosulphide anhydrous, preparation of (VIERI, CHEMISCHER FABRIKEN IN MAXHEIM), A., ii, 659.
- hydroperoxydide (GUTMANN), A., ii, 972.
- hydroxide, estimation of, volumetrically, in presence of sodium carbonate (ANDERSEN), A., ii, 985.
- perhydroxide (WOLFFSTENHIN), A., ii, 859.
- hypobromite, characteristic colour reactions produced by (DEHN and SCOTT), A., i, 789; (DEHN), A., ii, 907.
- hypochlorite; properties of the electrolytic bleaching solution (PESCH), A., ii, 492.
- hyposulphite *thioarsulphite*, constitution of (ORRIDGE), A., i, 192.
- action of, on nitro-derivatives (SEYFWEITZ and NOEL), A., i, 498.

- Sodium hyposulphite**, aniline, and formaldehyde, interaction of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 151.
 application of, in volumetric analysis (BOLLENBACH), A., ii, 229.
periodate, specific gravity of (BARKER), T., 17.
 iodide cubes, rapid valuation of (FIORA), A., ii, 735.
 molybdate and *d*-tartaric acid, formation of compounds in solutions of (QUINER), A., i, 713; (GROSSMANN), A., i, 854.
 molybdates, anhydrous (GROSCHUFF), A., ii, 501.
 nitrate, polymorphism of (BARLOW and POPE), T., 1528; P., 193.
 and lead nitrate, the temperature of spontaneous crystallisation of mixtures of (ISAAC), T., 384; P., 30.
 as manure (NAZARI), A., ii, 1068.
 commercial, effect of, on rye (DE GRAZIA), A., ii, 420.
 ammonium salts, and calcium cyanamide, manurial experiments with (WAGNER, HAMANN, and MENZINGER), A., ii, 622.
 and ammonium sulphate, manurial experiments with (BAESSLER), A., ii, 127; (CLAUSEN), A., ii, 981.
 and calcium cyanamide, action of, on mangolds (KLÖPFEL), A., ii, 619.
 action of organic nitrogen manures as compared with (POPP), A., ii, 727.
 nitrite, molecular volume of (RAY), T., 999; P., 75.
 oxide, heat of combination of, with acidic oxides (MIXTER), A., ii, 929.
di- and *tri*-oxide carbonates (WOLFENSTEIN and PETER), A., ii, 180.
peroxide (or *dioxide*) and ammonium persulphate, reaction between (KEMPF and OEHLER), A., ii, 764.
 action of, on gold (MEYER), A., ii, 47.
 and metallic sulphides, use of, for decomposing minerals and industrial products (WALTON and SCHOLZ), A., ii, 732.
 oxidising power of, and its use in qualitative analysis (CALHANE), A., ii, 635.
 use of, in qualitative analysis (CARON and RAQUET), A., ii, 630.
 use of, in quantitative analysis (PARK), A., ii, 628.
 analysis of (NIEMEYER), A., ii, 182.
- Sodium phosphate**, disodium phosphate, sodium hydrogen carbonate, and carbon dioxide, equilibrium between, at body temperature (HENDERSON and BLACK), A., ii, 467.
 ferripyrophosphate, ferropyrophosphates (PASCAL), A., ii, 193.
 silicate, interactions of, with metallic salt solutions (JORDIS and HENNIS), A., ii, 291.
 sulphate solutions, spontaneous crystallisation of (HARTLEY, JONES, and HUTCHINSON), T., 825; P., 70.
 and barium chloride, antagonistic action of, on the heart action (SCAFFIDI), A., ii, 520.
 and magnesium sulphate system (NACKEN), A., ii, 698.
 sulphide, estimation of, volumetrically (PODESCHETNIKOFF), A., ii, 66.
 sulphite, detection of, in presence of sulphate and thiosulphate (WESTON and JEFFREYS), A., ii, 320.
 thioantimonate (DONK), A., ii, 763.
 thioantimonate and thiosulphate, mixtures of, in water (DONK), A., ii, 953.
 thioantimonates (DONK), A., ii, 859.
 thiosulphate, the chemical dynamics of the reactions between organic halogen compounds and (SLATOR and TWISS), P., 286.
 titration of (MILOBENDSKI), A., ii, 130.
- Sodium alkyl compounds** and syntheses therewith (SCHORIGIN), A., i, 866, 881, 886.
 alkyl thiosulphates, action of alkalis on (PRICE and TWISS), T., 1395, 1403; P., 179, 185.
o-, *m*-, and *p*-nitrobenzylthiosulphates and the action of alkalis on (PRICE and TWISS), T., 1403; P., 185.
- Sodium and potassium**, estimation of, in silicates (THOMSEN), A., ii, 431.
- Soil**, physico-chemical processes in the production of (ROHLAND), A., ii, 59, 620.
 influence of plant constituents on the chemical and physical properties of (ZAILER and WILK), A., ii, 60.
 composition of the air in (LAT), A., ii, 888.
 distribution of solute between water and (CAMERON and PATTEN), A., ii, 125.
 influence of solubility on availability in (DAIKUHARA), A., ii, 128.
 constituents, effect of lime on the availability of (GUTHRIE and COHEN), A., ii, 889.

- Soil**, changes of availability of nitrogen in (LOEW and ASO), A., ii, 621.
 the Dyer method for the determination of plant food in (SHUTT and CHARRON), A., ii, 733.
 chemical and bacteriological effects of liming (VOORHEES, LIPMAN, and BROWN), A., ii, 317.
 experiments with ammonium salts on (EHRENBERG), A., ii, 1068.
 action of calcium cyanamide on different kinds of (REMY), A., ii, 220.
 effect of carbon disulphide on (EGOROW), A., ii, 421.
 are, containing less than 0.02% SO₂, benefited by special manuring with sulphates? (DAIKUHARA), A., ii, 128.
 fixation of nitrogen in, by free bacteria and its importance for the nutrition of plants (KOCH, LITZENBORFF, KRULL and ALVES), A., ii, 56.
 constituent, organic, isolation and toxic properties of (SCHREINER and SHOREY), A., ii, 421.
 microbiobiochemical formation of ammonia in (PEROTTI), A., ii, 124.
 apparatus for showing the ammonia-condensation power of (RÜSING), A., ii, 620.
 isolation of dihydroxysebacic acid from (SCHREINER and SHOREY), A., ii, 1067.
 ammoniacal nitrogen in (EHRENBERG), A., ii, 60.
 some properties of the organic matter in (KÖNIG, HASENBAUMER, and GROSSMANN), A., ii, 888.
 ammonia-soluble phosphoric acid of (FRAYS), A., ii, 622.
 amount of phosphoric acid in, relation between the, and the increased yield due to phosphatic manure (PILZ), A., ii, 123.
 isolation of pizolin-carboxylic acid from, and its relation to soil fertility (SCHREINER and SHOREY), A., ii, 889.
 acid, nitrification in (HALL, MILLER, and GIMMINGHAM), A., ii, 521.
 arable, ten years' experiments on denitrification in (AMFOLA), A., ii, 525.
 black, nitrification in (SASANOFF), A., ii, 614.
 clay, protective action of colloids on (KEFFELER and SPANGENBERG), A., ii, 60.
 lamias carbonate, and their conversion into grey sand soils (LEEBERFF), A., ii, 229.
 of the northern portion of the Great Plains region, estimation of nitrogen and humus in (ALWAY and TRUMBULL), A., ii, 1067.
 paddy, behaviour of nitrates in (DAIKUHARA and IMASEKI), A., ii, 127.
 Roman, presence of thionium in (BLANC), A., ii, 248, 452.
 poor sandy, why are, often easily injured by liming? (YOKOTAMA), A., ii, 621.
 analyses, comparative investigation of the results of chemical, and of cultivation experiments (GRIFF), A., ii, 421.
 a method of, for investigations in plant physiology (MITSCHERLICH), A., ii, 428.
 improved method for estimating the acidity of (SECHTING), A., ii, 221; (VAN SCHERMBECK), A., ii, 743, 994; (TACKE and SCHÜTTE), A., ii, 994.
 biological method for estimating alkali carbonates in (CHRISTENSEN), A., ii, 67.
 estimation of alkaline earths in (FOERSTER), A., ii, 1072.
 use of nitron for estimating nitrates in (LITZENBORFF), A., ii, 120.
 colorimetric estimation of nitrogen in (CHOTCHAK and POTGER), A., ii, 223.
 estimation of phosphoric acid as phosphomolybdic acid in (CHRISTENSEN), A., ii, 895; (RADEN), A., ii, 896.
 estimation of potassium in (SCHENKE), A., ii, 321; (RONNER), A., ii, 194.
 application of the cobaltinitrite method to the estimation of potassium in (DRUSHEL), A., ii, 755.
 See also Manurial experiments and Plants.
Soil bacteria. See under Bacteria.
Soil moisture, apparatus for measurement of the osmotic pressure of (KÖNIG, HASENBAUMER, and GROSSMANN), A., ii, 888.
Soja bean oil (KAMETAKA), A., i, 851.
Solanin from the seeds and flowers of *Solanum tuberosum* (COLOMBANO), A., i, 99.
Solanum Dabestanum, fruit of (WELLS and REIDER), A., ii, 58.
Soldiers, composition and energy value of the food of (Pembrey and PARKER), A., ii, 306.
Solid state, the (KURBATOFF), A., ii, 600.
Solid substances, velocity of absorption of gaseous substances by (HASTZSCH and WILGNER), A., ii, 158.

- Solidification** of inorganic salts and salt mixtures (PLATO), A., ii, 758.
- Solubilities** in mixed solvents (HERZ and KUHN), A., ii, 569.
- Solubility**, influences of (KERNOT, D'AGOSTINO, and PELLEGRINO), A., ii, 563.
- Solubility product**, the (STIEGLITZ), A., ii, 673.
- Soluble substances**, action of insoluble substances on (OECHSNER DE CONINCK and ARZALLER), A., ii, 843.
- Solute**, volatile, vapour pressure and osmotic pressure of a (CALENDAR), A., ii, 1019.
- Solution** in a dissolved solid (PARSONS), A., ii, 89.
time taken by substance in dissolving (GAILLARD), A., ii, 567.
- Solutions**, theory of (SCARPA), A., ii, 473; (CALENDAR), A., ii, 671; (IKEDA), A., ii, 932.
refractive indices of (GETMAN and WILSON), A., ii, 1001.
viscosity of (FAWCSITT), T., 1004; P., 121; (RANKEN and TAYLOR), A., ii, 87.
viscosity and conductivity of some aqueous (GREEN), T., 2023, 2049; P., 187.
viscosity, "negative," of aqueous (TAYLOR), A., ii, 818.
viscosity of dilute alcoholic (HIRATA), A., ii, 930.
studies of the processes operative in (ARMSTRONG), A., ii, 814; (ARMSTRONG and WHEELER), A., ii, 815; (ARMSTRONG and CROTHERS), A., ii, 816; (CALDWELL and WHYMPER), A., ii, 817.
in mixtures of alcohol and water (CRNO), A., ii, 160.
in methyl alcohol, methyl chloride, and ethyl ether, critical temperatures of (CENTNERSZWER), A., ii, 13.
of certain salts, conductivity and viscosity of, in water, methyl alcohol, ethyl alcohol, and acetone and in binary mixtures of these solvents (JONES and VEZEY), A., ii, 259, 260.
aqueous, hydrolysis, hydrolation, and hydration as determinants of the properties of (ARMSTRONG), A., ii, 814.
concentrated aqueous, boiling and freezing points of, and the question of the hydration of the solute (JOHNSTON), A., ii, 661.
- Solvent power** and dielectric constant (WALDEN), A., ii, 159.
- Solvents**, relation between the ionising power and the dielectric constants of (McCoy), A., ii, 637.
influence of, on the equilibrium constant (PISSARJEWSKY and LEVITES), A., ii, 570.
influence of, on the rotation of optically active compounds (PATTERSON and THOMSON), T., 353; (PATTERSON and McDONALD), T., 936; P., 125; (PATTERSON), T., 1836; P., 216.
mixed, solubilities in (HERZ and KUHN), A., ii, 569.
organic, and their dissociative power (WALDEN), A., ii, 159.
supposed connexion between dielectric constant and isomerising power of, in keto-enol desmotropy (MICHAEL and HIBBERT), A., ii, 455.
- Soranjidiol** and its diacetyl derivative (OESTERLE and TISZA), A., ii, 527.
- Sorbic acid** and its polymeride (RIEDEL), A., i, 501.
- Sorbose**, formation of, from *l*-gulose and *l*-idose (ALBERDA VAN ERENSTEIN and BLANKSMA), A., i, 136.
- Sound**, measurement of the velocity of, in liquids (DÖRSING), A., ii, 153.
- Sorhlet extractor**, modification of the (WOOD), A., ii, 421.
- Spark discharge**. See under Electrochemistry.
- Spark spectra**. See under Photochemistry.
- Sparteine** (MOUREU and VALEUR), A., i, 43, 44, 103; (VALEUR), A., i, 736, 1006.
application of Hofmann's reaction to (MOUREU and VALEUR), A., i, 43.
methiodides (MOUREU and VALEUR), A., i, 563.
- iso***Sparteine** and its derivatives (MOUREU and VALEUR), A., i, 103.
constitution of (MOUREU and VALEUR), A., i, 206.
transformation of, into α -methylsparteine (VALEUR), A., i, 736.
additive salts (MOUREU and VALEUR), A., i, 44, 103.
- Specific cohesion**, heat of fusion, and molecular weight at the melting point (WALDEN), A., ii, 1014.
- Specific heat**. See under Thermochemistry.
- Specific inductive capacity**. See Dielectric constant under Electrochemistry.
- Spectra**. See under Photochemistry.

- Spectrophotometer and Spectroscopic apparatus and investigations.** See under Photochemistry.
- Sphaero rotation** (ROSENHEIM and TEBB), A., ii, 879.
- Spices,** estimation of essential oils in (REICH), A., ii, 1075.
- Spirits,** estimation of alcohol and extract in, by the refractometer (HACE), A., ii, 738.
- Splanchnic nerve.** See Nerve.
- Spleen,** guanilic acid of the (JONES and ROWNTREE), A., i, 487.
- Spleen,** nucleic acid of the. See Nucleic acids.
- Spleen glands.** See Glands.
- Spongostene and Spongosterol and its bromo- and bromoacetyl derivatives and chloride from *Suberites domuncula*** (HENZE), A., i, 418.
- Springs.** See under Water.
- Squalus acanthias*,** a globulin from the egg-yolk of (ALSBERG and CLARK), A., ii, 963.
- Stannic acids and chloride.** See under Tin.
- Stannichlorides.** See under Tin.
- Starch,** properties of pure (MAQUENNE), A., i, 249.
- properties of, in relation to its colloidal condition** (FOUARD), A., i, 503.
- colloidal properties of, and the unity of its constitution** (FOUARD), A., i, 138, 553.
- influence of the alternating current on the rate of hydrolysis of, by diastase and mineral acids** (LEBEDEFF), A., i, 321.
- action of formaldehyde on** (REICHARD), A., i, 606.
- serum inhibiting the action of malt-extract on** (GESSARD and WOLFF), A., i, 379.

- Stilbene, cis -diamino-, picrate and di-tormyl derivative of** (FISCHER and FRAUEN), A., i, 220.
- 2,4'-2,4'-6-tri-amino- and -nitro-** (GREEN and BADDLEY), T., 1725; P., 202.

- Stilbene**, 2-amino-4-cyano-, and its acetyl derivative, 2:4:6-*tri*- and 2:4:6:4'-*tetra*-nitro-2-nitro-4-cyano-, and its dibromo-derivative, and 4-nitro-2-cyano- (ULLMANN and GSCHWIND), A., i, 623.
- 3:3'-*di*-aminodicyano- and 3:3'-*di*-nitrodicyano- (HELLER), A., i, 217.
- Stilbene-4-carboxylic acid**, 2-amino- and 2-nitro- (ULLMANN and GSCHWIND), A., i, 623.
- Stilbenedicarboxylic acid**, nitration of (HELLER and LEVDEN), A., i, 216.
- Stilbene-2:2'-dicarboxylic acid**, 4:4'-*di*-nitro-, and its sodium salt (GREEN and BADDILEY), T., 1724; P., 202.
- Stilbenedicarboxylic anhydride** 3:3'-*di*-amino-, and 3:3'-*di*-nitro- (HELLER), A., i, 217.
- Stilbene group**, colouring matters of the (GREEN and BADDILEY), T., 1721; P., 201.
- Stilbene series** (ULLMANN and GSCHWIND), A., i, 622.
- Stilbene-4-sulphonamide**, 2-amino-, and its acetyl derivative, and 2-nitro- (ULLMANN and GSCHWIND), A., i, 623.
- Stilbene-2-sulphonanilide**, 4-nitro- (ULLMANN and GSCHWIND), A., i, 623.
- Stilbite** from Montresta, Sardinia (PELLACANI), A., ii, 864.
- Stirrer**, circulation, for liquids (GOETZE), A., ii, 681.
- Stirring**, relation between the velocity of, and the velocity of reaction in non-homogeneous systems (JABŁCZYŃSKI), A., ii, 1020.
- Stoicheiometric laws**, deduction of the (DE VRIES), A., ii, 366; (BAUR), A., ii, 573; (WALD), A., ii, 681.
- are the, intelligible without the atomic hypothesis? (KUHN), A., ii, 98, 826; (WALD), A., ii, 367.
- Stomach contents**, peptolytic ferments in the (ABDERHALDEN and MEDIGRECANI), A., ii, 1049.
- detection of free hydrochloric acid in the (STRENSMA), A., ii, 818.
- Stopcocks**, porous materials as substitutes for, in the manipulation of gases (STOCK), A., ii, 89.
- Strain theory**, v. Baeyer's, thermochemical evidence for (REDGROVE), A., ii, 758.
- Strontia**. See Strontium oxide.
- Strontium**, spectrum of, in the orange and red (JECHÉL), A., ii, 138.
- physiological action of, compared with that of calcium and magnesium (MELITZER and AUER), A., ii, 519.
- Strontium**, influence of, on the growth and composition of bone (STOELTZNER), A., ii, 769.
- Strontium salts** free from barium, preparation of (CARON and RAQUET), A., ii, 496.
- Strontium chloride**, physiological action of (BURGASSI), A., ii, 405.
- ammonium chromate (GRÖGER), A., ii, 690.
- nitrite, molecular volumes of (RÄY), P., 240.
- oxide (*strontia*), anhydrous, heat of formation of (DE FORCRAND), A., ii, 155.
- hydrates of (DE FORCRAND), A., ii, 764.
- silicide, preparation of (GOLDSCHMIDT), A., ii, 1037.
- Strontium**, quantitative separation of, from barium (KAHAN), A., ii, 133.
- Strophanthin** and Munchi arrow poison (MINES), A., ii, 522.
- Strophanthus** and digitalis, action of, on the heart (TIGERSTEDT), A., ii, 612.
- Strüverite** and its relation to ilmeno-rutile (PRIOR and ZAMBONINI), A., ii, 398.
- Strychnine**, new method of oxidising (LEUCHS), A., i, 563.
- physiological action of (SANO), A., ii, 974.
- behaviour of the brain towards (SANO), A., ii, 974.
- action of, on the nerve fibres of the vagus of the heart (FORLI), A., ii, 721.
- effect of, on muscular work (VARRIER-JONES), A., ii, 313.
- the supposed antidotes to (DORLEN-COURT), A., ii, 721.
- so-called antitoxic power of animal tissues towards (PELLACANI and FOLLI), A., ii, 1062.
- iodine derivatives of (BURACZEWSKI and KOZŃIEWSKI), A., i, 1007.
- Strychninonic acid** (LEUCHS), A., i, 564.
- Strychnos aculeata*, active principles of the fruit of an African (HÉBERT), A., ii, 317.
- Strychnos alkaloids** (LEUCHS), A., i, 563.
- Sturgeon**, Caspian, protamine from the spermatozoa of the (MALEŇČEK), A., i, 1030.
- Styphnic acid**, molecular compounds of (GIBSON), T., 2098; P., 241.
- Styrcitol** from the fruit of *Styrax Obassia* (ASAHINA), A., ii, 59.
- Styrene**, formation of, from cinnamic acid by means of moulds (HERZOG and RUPKE), A., ii, 1064.

- Styrene**, iodohydrins and alkyl iodohydrins from (TIFFENEAU), A., i, 19.
 oxide (TIFFENEAU and FOURNEAU), A., i, 337.
- Styrene**, *o*-hydroxy-. See *o*-Vinylphenol.
- Styrenes**, action of thionyl chloride on (BARGER and EWINS), T., 2086; P., 237.
- 2-Styrylbenzopyrylium salts**, *o*-hydroxy- (DECKER and FELSHER), A., i, 906.
- Styrylcarbamic acid** and *o*-nitro-methyl esters of (WEERMAN), A., i, 22.
- Sublimation**, vacuum, practical studies in (KEMPF), A., ii, 929.
- Substance**, C_8H_8OS , from acetylene and sulphur dioxide (LOSANTSCH), A., ii, 33.
 $C_2H_3O_2N_3$, from nitroacetamide chloride (STEINKOFF and BOHEMANN), A., i, 328.
 $C_8H_8S_2$, from carbon disulphide and hydrogen or hydrogen sulphide (LOSANTSCH), A., ii, 32.
 C_8H_8 , from acetylene and ethylene (LOSANTSCH), A., ii, 33.
 $C_2H_3N_3S$, formula of (PFEIFFER and TIGENER), A., i, 614.
 $C_2O_2S_2$, from carbon disulphide and carbon monoxide (LOSANTSCH), A., ii, 32.
 $(C_2H_3O)_n$, from ethylene and carbon monoxide (LOSANTSCH), A., ii, 33.
 $C_2H_3O_2N_2S_2$, from rongalite, ammonium chloride, and formaldehyde (BISZ and ISAAC), A., i, 940.
 C_6H_8O (two), and their oximes, from the condensation of acetaldehyde (ZEISEL and v. BITTO), A., i, 761.
 $(C_2H_3O)_n$, from the absorption of oxygen by the condensation product of acetylene (LOSANTSCH), A., i, 846.
 $C_8H_8O_2N$, from β -*p*-methoxyphenyl-propaldehyde (BALMANN), A., i, 901.
 $C_2H_3O_2N$, from the action of nitric acid on C_2H_2 (JOVITSCHITSCH), A., i, 118.
 $C_2H_3O_2N_2$, from chloroacetyl diglycinamide and ammonia (PHELPS and FERRIS), A., i, 149.
 $C_2H_8S_2$, from carbon disulphide and acetylene (LOSANTSCH), A., ii, 32.
 $C_2H_3O_2N$, from *o*-nitrotoluene (KALLE and CO.), A., i, 980.
 $C_2H_3O_2N$, from the action of nitric acid on C_2H_4 (JOVITSCHITSCH), A., i, 118.
 $C_2H_3O_2N_2$, from the oxidation of 1:2-methyl- Δ^2 -cyclopentene (KUSNER), A., i, 895.
- Substance**, $C_7H_5O_2N$, from ethyl iodomethylpiperidumacetate (v. BRAUN), A., i, 608.
 C_8H_{10} , from acetylene and ethylene (LOSANTSCH), A., ii, 33.
 $C_8H_8S_2$, from acetylene and hydrogen sulphide (LOSANTSCH), A., ii, 32.
 $C_8H_8O_2$ (two), from 8-hydroxy-1:2-dihydroquinoxaline (MOTTEWSEI), A., i, 870.
 $(C_2H_3N_2)_2$, from the decomposition of the silver salt of phenylmalononitril- (HESSLER), A., i, 182.
 $C_8H_8O_3$, from acetylene and carbon monoxide (LOSANTSCH), A., ii, 33.
 $C_8H_8S_2$, from carbon disulphide and ethylene (LOSANTSCH), A., ii, 32.
 C_2H_3O , polymeride of, from the action of the silent electric discharge on moist methane (LÖB), A., i, 117.
 $C_8H_8O_2N_2$, from isatin and hydrogen cyanide (HELLER and NOTZEL), A., i, 267.
 $C_8H_8ON_2$, from dicyanodiamide and benzoic anhydride (FOUL), A., i, 576.
 C_3H_5OCl , from salina ketone and hydrogen chloride (WALLAU and HEXER), A., i, 425.
 $(C_{10}H_7O)_n$, from the reduction of 4:7-dimethylcoumarin (FRIES and FICKERT), A., i, 821.
 $C_{10}H_7O_2$, from the condensation of acetaldehyde (ZEISEL and v. BITTO), A., i, 761.
 $C_{10}H_7S_2$, from acetylene and hydrogen sulphide (LOSANTSCH), A., ii, 33.
 $C_{10}H_7O$, from the Californian laud (TUTIN), T., 257; P., 24.
 $C_{10}H_7O_2$, from ethylene and carbon monoxide (LOSANTSCH), A., ii, 33.
 $C_{10}H_7O_2Cl_2$, from the action of thionyl chloride on isosafrole dibromide (BARGER and EWINS), T., 2090.
 $C_{12}H_9O_2I$, from the action of Wurtz solution on β -naphthol (WAKE and INGLEY), A., i, 416.
 $C_{12}H_9O_2N$, from the action of hydrochloric acid on ethyl ammonium 6-hydroxy-2-methylpyridine-3:5-di-carboxylate (SIMMONS), T., 1029.
 $C_{10}H_{13}OBr$, from the acid, $C_{10}H_{13}O_2Br$, from pinene (HENDERSON and HENDERSON), T., 291; P., 31.
 $C_{10}H_7OCl$, from pinene (HENDERSON and HENDERSON), T., 291; P., 31.
 $C_{10}H_{15}O_2N_2$, from silver pentosocampophor (ANGELL and MARCHETT), A., ii, 842.
 $C_3H_7O_4N_2S_2$, from the action of ethyl chloroacetate on hydrazine dithiocarbamate (ANDREASCH), A., i, 684.

- Substance**, $C_{11}H_{20}O_2N_2$ (two), from the hydrolysis of casein (SKRAUP), A., i, 931.
- $C_{12}H_{20}O_6$, from ethyl oxalate and ethyl bromodimethylacetate (RASSOW and BAUER), A., i, 316.
- $C_{12}H_{18}S_8$, from ethylene and hydrogen sulphide (LOSANITSCH), A., ii, 33.
- $C_{12}H_{20}O_5N_2$, from the hydrolysis of casein (SKRAUP), A., i, 931.
- $C_{12}H_{16}O_6$, from the oxidation of tetramethyldihydrobrazileinol (ENGELS, PERKIN, and ROBINSON), T., 1146.
- $C_{13}H_{18}O_8$, from the oxidation of tetramethyldihydrobrazileinol (ENGELS, PERKIN, and ROBINSON), T., 1145.
- $C_{13}H_{14}O_4N_4$, from 2:2-dimethylindole (ANGELI and MARCHETTI), A., i, 207.
- $C_{13}H_{22}O_5N_2$, and its copper salt, from the condensation of aminopinedicarboxylic acid and glycine (GODDEN), T., 1172.
- $C_{13}H_{20}O_2N$, from the action of propylamine on ethyl vinyl ketone (BLAISE and MAIRE), A., i, 399.
- $C_{14}H_{12}O$, from 9-methylfluorene alcohol (DAUFRESNE), A., i, 165.
- $C_{14}H_{12}O_2$, and its acetyl derivative, from Grindelia resin (POWER and TUTTIN), A., ii, 526.
- $C_{14}H_{16}N_6$, from the action of magnesium phenyl bromide on bistriazothane (FORSTER, FIERZ, and JOSHUA), T., 1072; P., 102.
- $C_{14}H_{22}O$, from ψ -euphorbone (TSCHIRCH and LEUCHTENBERGER), A., i, 196.
- $C_{14}H_{12}ON_2$, and its benzoate and acetate and methyl derivative, from α -phenylbenzylhydrazine and carbamide (MILRATH), A., i, 581.
- $C_{15}H_{12}O_3$, from aloë-emodin (HESSE), A., i, 439.
- $C_{15}H_{18}O_3$, from the action of benzaldehyde on magnesium and ethyl α -bromoisobutyrate (ZELTNER), A., i, 244.
- $C_{15}H_{18}Cl_8$ (or $C_{15}H_{20}Cl_8$), from cadinene (DEESSEN and LEWINSOHN), A., i, 354.
- $C_{15}H_{22}O_4$, from caryophyllene (DEUSSEN and LEWINSOHN), A., i, 354.
- $C_{15}H_{22}Br_8$, from cadinene (DEUSSEN and LEWINSOHN), A., i, 354.
- $C_{15}H_{15}O_4N$, from the action of ethyl pyruvate on *p*-toluidine (SIMON), A., i, 738.
- $C_{16}H_{10}O_3$, from the root-bark of *Morinda citrifolia* (OESTERLE and TISZA), A., ii, 527.
- Substance**, $C_{16}H_{16}O_2$, from the action of sodium ethoxide on phenylethylene glycol methyl ether (TIFFENEAU), A., i, 19.
- $C_{16}H_{16}O_7$, from the condensation of methyl 2:4-dimethoxybenzoylpropionate with ethyl oxalate (PERKIN and ROBINSON), T., 507.
- $C_{16}H_{18}O_5N_2$, from the substance, $C_{16}H_{18}O_5N_4$ (HELLER and SOURLIS), A., i, 208.
- $C_{16}H_{16}N_3S$, from 8-thiocyanoquinoline and aniline (EDINGER), A., i, 364.
- $C_{16}H_{18}O_3N_4$, and its reactions (HELLER and SOURLIS), A., i, 208.
- $C_{17}H_{18}O_3N_2$, from the interaction of *p*-nitrobenzyl chloride and isonitrosocamphor (FORSTER and HOLMES), T., 248; P., 8.
- $C_{17}H_{20}O_4N_2$ (m.p. 114°), from the interaction of *p*-nitrobenzyl bromide and isonitrosocamphor (FORSTER and HOLMES), T., 250; P., 9.
- $C_{17}H_{20}O_4N_2$ (m.p. 175°), from the interaction of *p*-nitrobenzyl chloride and isonitrosocamphor (FORSTER and HOLMES), T., 248; P., 8.
- $C_{18}H_{16}O$, from the action of magnesium ethyl bromide on anthraquinone (CLARKE), A., i, 331.
- $C_{18}H_{16}S$, from the action of sulphur on resin oil (SCHULTZE), A., i, 356.
- $C_{18}H_{18}N_4$, from methylanilinoacetonitrile and cyanogen bromide (v. BRAUN), A., i, 625.
- $C_{18}H_{20}O_5$, from the expressed oil of nutmeg (POWER and SALWAY), T., 1655; P., 198.
- $C_{18}H_{20}O$, from ψ -euphorbone (TSCHIRCH and LEUCHTENBERGER), A., i, 196.
- $C_{18}H_{14}O_6N_4$, from β -naphthol and 2:3:5-trinitro-4-acetylaminophenol (MELDOLA and HAY), P., 211.
- $C_{18}H_{20}OCl_3$, from the compound, $C_8H_{15}OCl$, and hydrogen chloride (WALLACH and HEYER), A., i, 425.
- $C_{18}H_{17}O_5N_4Cl$, from the action of nickel on carbazole (PADOA and CHIAVES), A., i, 105.
- $C_{19}H_{20}ON_2$, from the action of ethyl pyruvate on *p*-toluidine (SIMON), A., i, 738.
- $C_{19}H_{20}O_3N$, from the action of ozone on thebaine (RIEDEL), A., i, 1006.
- $C_{19}H_{20}O_2N_2$, from the action of pyruvic acid on *p*-toluidine (SIMON), A., i, 687.
- $C_{19}H_{20}O_2N_3$, from the decomposition of oleic acid ozonide (MOLINARI and BAROSI), A., i, 850.

- Substance, $C_{10}H_{15}N_3$** , from 2-methyl-indole, ethyl acetate, and sodium ethoxide (ANGELI and MARCHETTI), A., i, 208.
- $C_{20}H_{30}O_3$, and its acetyl, methyl, and benzoyl derivatives, from papaverinium methiodide (DECKER and DUNANT), A., i, 206.
- $C_{20}H_{25}N_3$, from ethylanilinoacetone nitrile and cyanogen bromide (v. BRAUN), A., i, 625.
- $C_{20}H_{25}O_3$, from 2-hydroxy-4-methyl-phenyldimethylcarbinol (FRIES and FICKEWIRTH), A., i, 821.
- $C_{20}H_{25}O_3N$, from the alkaloid, $C_{10}H_{15}O_3N$, from Chinese *Corydalis* tubers (MAKOSH), A., i, 825.
- $C_{20}H_{25}O_3N_2 \cdot 4H_2O$, from quinoline and methyl salicylate (STADY), A., i, 915.
- $C_{20}H_{25}O_3N_2$, from quinine (WOLFFENSTEIN and WOLFF), A., i, 283.
- $C_{20}H_{25}N_3$, and its trinitro-derivative, from the action of copper powder on indazole (JACOBSON and HUBER), A., i, 299.
- $C_{20}H_{21}O$, from α -577-tetraphenylbutyrolactone (REIMER and REYNOLDS), A., i, 989.
- $C_{20}H_{25}O_3$, from 1-[2:5-dimethylhydrocoumarinyl]-2:5-dimethylhydrocoumarone (FRIES and KLOSTERMANN), A., i, 822.
- $C_{20}H_{35}O_3$, from *Sinarauba amara* (GILLING), A., ii, 527.
- $C_{20}H_{25}O_4$, from methane, ethylene, and oxygen (LOSANTISCH), A., ii, 33.
- $C_{20}H_{21}O_3$, from the absorption of oxygen by the condensation product of ethylene (LOSANTISCH), A., i, 846; ii, 33.
- $C_{20}H_{25}O_4N_2$, from the action of ethyl pyruvate on *p*-toluidine (SIMON), A., i, 739.
- $C_{20}H_{25}O_3N_2S_2$, from dinitrodiphenyl disulphide (FROMM and WILLMANN), A., i, 632.
- $C_{20}H_{25}O_3$, from ethyl phenylpropionate, acetophenone, and sodium ethoxide (REDEMANN), T., 455; P., 52.
- $C_{20}H_{25}O_3N$, from the action of ethyl oxalacetate on benzylidene β -naphthylamine (SIMON and MARGUS), A., i, 296.
- $C_{20}H_{25}O_3N_2S_2$, from rongalite, aniline hydrochloride, and formaldehyde (BINZ and ISAAC), A., i, 941.
- $C_{20}H_{25}O_3N$, from benzyl cyanide, sodium methoxide, and ethyl cinnamate (VILEY and McDONALD), A., i, 244.
- Substance, $C_{20}H_{25}O_{10}N_3$** , and its copper salt, from the condensation of aspartic acid and aminopropionic oxylic acid (GODDEN), T., 1172.
- $C_{27}H_{45}O_3$, and its acyl derivatives, from the oxidation of cholesterol (PICKARD and YATES), T., 1955; P., 121.
- $C_{27}H_{45}O_4N_2S_2$, from rongalite and aniline hydrochloride (BINZ and ISAAC), A., i, 941.
- $C_{30}H_{35}$, and its bromo-derivatives, from the condensation of acetylene (JOVITSCHITSCH), A., i, 118.
- $C_{30}H_{35}$, from the condensation of ethylene, and the action of bromine on it (JOVITSCHITSCH), A., i, 118.
- $C_{30}H_{35}O_3$, and its acetate from the latex from *Euphorbia* (COHEN), A., i, 884.
- $C_{30}H_{35}O_3N_3$, from the action of fuming nitric acid on the substance, $C_{30}H_{35}$ (JOVITSCHITSCH), A., i, 118.
- $C_{30}H_{35}O_3S_2$, and $C_{30}H_{35}O_3S_2$, from thiadiphenylideneacetophenone (FROMM and LAMBERTH), A., i, 990.
- $C_{30}H_{35}OBr_2S_2$, from the action of bromine on thiadiphenylideneacetophenone (FROMM and LAMBERTH), A., i, 990.
- $C_{30}H_{35}O_3N_2S_2$, from the reduction of dibenzylidimethylthioninedisulphonic acid (GRIEM and SCHNOLZER), A., i, 113.
- $C_{30}H_{40}$ (or $C_{30}H_{40}O$), from the latex from *Euphorbia* (COHEN), A., i, 884.
- $C_{31}H_{43}O_3$, from olive leaves (POWER and TUTIN), T., 898; P., 117.
- $C_{31}H_{43}O$, from the reduction of geraniol (ENSKLAAR), A., i, 664.
- $C_{32}H_{31}O_3$, from β -methylanthraquinone (BADISCHE ANILIN- & SODA-FABRIK), A., i, 999.
- $C_{34}H_{45}O_3$, from the oxidation of the lactone of diphenyl-2-hydroxy-3-phenylanthranic acid (v. LIEBIG and KEIM), A., i, 449.
- $C_{34}H_{35}$, from diphenylketonequinoline and anthraquinone (STAUINGER), A., i, 411.
- $C_{34}H_{35}O_3$, from acetylene and oxygen (LOSANTISCH), A., ii, 32.
- $C_{34}H_{35}O_3N_2$, from the action of aniline on α -benzoylbenzoic acid (MEYER), A., i, 25.
- $C_{34}H_{35}O_3$, from the hydrolysis of methyl α -methoxyacetate (v. LIEBIG and KEIM), A., i, 449.
- $C_{34}H_{35}O_3N_2$, from ethyl oxalacetate and benzylidene β -naphthylamine (SIMON and MARGUS), A., i, 296.

- Substance**, $C_{16}H_{13}N_3$, from bisanhydrophenacylamine (GABRIEL and LIECK, A., i, 465).
- $C_{18}H_{15}$, from acetylene (LOSANITSCH), A., ii, 33.
- $C_{18}H_{15}N_3$, from the hydrolysis of aminooacetal (WOHL and LANGE), A., i, 17.
- $C_{18}H_{15}O_3$, from acetylene (LOSANITSCH), A., ii, 33.
- $C_{18}H_{15}O_3$, and its diacetate, from the oxidation of dicholestetyl ether (PICKARD and YATES), T., 1682; P., 121.
- $C_{20}H_{15}O_3N_3$, from aniline and benzoic acid (v. LIEBIG), A., i, 646.
- $C_{25}H_{15}O_3N_3$ and $C_{28}H_{15}O_3N_3$, from *o*-toluidine and benzoic acid (v. LIEBIG), A., i, 646.
- Substitution** of alkoxy-groups in the benzene nucleus by hydrogen (SEMMER), A., i, 557.
- of hydroxyl-groups by hydrazino-groups (FRANZEN and EICHLER), A., i, 831.
- of the sulphonic group by the cyano- and carboxyl-groups in azo-compounds (LANGE), A., i, 300.
- Succinamic acid**, ethyl ester (MOL), A., i, 77.
- Succindialdehyde**, molecular dispersion of (HARRIES), A., i, 317.
- unimolecular (HARRIES and HOHENEMSER), A., i, 133.
- Succinein**, $C_{18}H_{15}O_3$, and its acetate, from succinic anhydride and quinol (MEYER and WITTE), A., i, 671.
- Succinic acid**, production of, during alcoholic fermentation (KRELLICH), A., ii, 416.
- method of estimating, in fermented liquids containing other fixed and volatile acids (POZZI-ESCOT), A., ii, 993.
- Succinic acid**, alkaloidal salts, and their optical activity (HILDITCH), T., 704; P., 61.
- aluminium salt, occurrence of, in proteaceous trees (SMITH), A., ii, 885.
- ammonium ethyl ester-salt (MOL), A., i, 77.
- Succinic acid**, cetyl and *o*- and *p*-nitrobenzyl esters (MEYER and MARX), A., i, 602.
- ethyl ester, influence of certain sulphates on the formation of (PHELPS, PALMER, and SMILLIE), A., i, 790.
- Succinic acid**, amino-. See Aspartic acid.
- dibromo-, benzyl and cetyl esters (MEYER and MARX), A., i, 602.
- Succinic acid**, dioximinol-, ethyl ester, action of nitric acid on (WAHL), A., i, 141.
- Succinic acids**, aromatic, synthesis of some (AVERY and UPSON), A., i, 343.
- Succinimide** hydrogen peroxide (TANATAR), A., i, 400.
- 4-Succiniminophthalic acid**, methyl ester (BOGERT and RENSHAW), A., i, 652.
- Succinophenone**, dibromo-, action of phenylhydrazine and of *as*-phenylbenzylhydrazine on (MEYER and MARX), A., i, 602.
- Succinyl chloride**, tautomerism of (MEYER and MARX), A., i, 602.
- Succinylcresotic acids**, *o*-, *m*-, and *p*- (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 798.
- Succinylsalicylic acid** and its methyl homologues, preparation of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 798.
- Sucroclasm**. See Sugars, fission of.
- Sucrose** (*cane sugar*, *saccharose*), conductivity and viscosity of solutions of (GREEN), T., 2023; P., 187.
- and lithium chloride, conductivity and viscosity of mixtures of solutions of (GREEN), T., 2049; P., 187.
- solutions, osmotic pressure of, at 10° (H. N. and H. V. MORSE), A., ii, 671.
- osmotic pressure of, at 15° (MORSE and MEARS), A., ii, 1019.
- density of (FOUQUET), A., i, 855.
- density of aqueous solutions of (FOUQUET), A., i, 855.
- inversion of (OSAKA), A., i, 856.
- theory of the inversion of (MEYER), A., ii, 265.
- inversion of, by invertase (HUDSON), A., i, 605, 856; (ACREE), A., ii, 1022.
- and other substances (salts and non-electrolytes), changes effected by the reciprocal interference of (CALDWELL and WHYMPER), A., ii, 817.
- the storage and transportation of, in the beet (STROHMER), A., ii, 726.
- detection of (POZZI-ESCOT), A., ii, 740.
- polarimetric determination of (WATTS and TEMPANY), A., ii, 236.
- normal tubes for the polarimetric estimation of (ROUSSER), A., ii, 73; (PELLAT), A., ii, 235.
- and invert sugar, estimation of, in mixtures (LING and RENDLE), A., ii, 542.
- Sugar** in blood (RONA and MICHAELIS), A., ii, 117; (MICHAELIS and RONA), A., ii, 329.

- Sugar**, total amount of, in blood (LÉPINE and BORLUP), A., ii, 957.
 of blood, behaviour of, after bleeding (ANDERSSON), A., ii, 767.
 apparatus for polarising, at 87° (SV), A., ii, 1076.
 excretion of, in healthy men (SCHÖNDORFF), A., ii, 311.
 action of various chemical substances on the excretion of (BAER and BLUM), A., ii, 122.
 estimation of (JESSEN-HANSEN), A., ii, 638; (BANG), A., ii, 738.
 estimation of, by Allihn's and Meissl's methods (SCHAUWMAN), A., ii, 437.
 estimation of, in blood (BANG), A., ii, 235.
 estimation of small quantities of, in urine (SCHÖNDORFF), A., ii, 311.
Sugar from morindin and its phenylbenzylhydrazide and phenylsazone (OESFLE and TISZA), A., i, 37.
Sugar, invert, and sucrose, estimation of, in mixtures (LING and KENDLE), A., ii, 542.
 influence of clarification with lead acetate on the estimation of (SCHREFFEL), A., ii, 1676.
Sugar group, dissociation processes in the (NEF, A., i, 5; (KILIANI), A., i, 128.
Sugar solutions, effect of clarification with basic lead acetate on the optical activity and copper reducing power of (WATTS and TEMPANY), A., ii, 236.
 fermentation of formaldehyde in (RAMSAY), A., ii, 994.
Sugars (BLANKSMA and ALBERDA VAN EKENSTEIN), A., i, 951.
 and their reduction and bleatification from glucosides (ALBERDA VAN EKENSTEIN and BLANKSMA), A., i, 9.
 electrolysis of (NEUBERG), A., i, 128.
 fission of "sucrocloram" (LOU), A., i, 715, 764.
 rate of oxidation of, in an acid medium (BENZELD), A., i, 135.
 decomposition of (NEUBERG), A., i, 765.
 utilisation of, by the tissues (MCGHEE), A., ii, 466.
 the capacity of the liver to reverse the optical action of (FETTER), A., ii, 167.
 phenylhydrazones of (ROBERT), A., i, 1614.
 precipitation of, by cupric hydroxide (YOSHIMIZU), A., i, 765.
Sugars and glucosides, application of biochemical methods for the detection of, in *Taxus* (LEYEBURR), A., ii, 57.
 colour and spectral reactions of, with naphtharesorcinol and hydrochloric acid (TOLLENS and ROHVE), A., ii, 638.
 value of the different methods for estimating, in urine (FUSK), A., ii, 902.
Sugars, C_6 from meta- and para-saccharin (KILIANI), A., i, 135.
Sugars, reducing, detection and bleatification of certain, by condensation with *p*-bromobenzylhydrazide (KENDALL and SHERMAN), A., ii, 902.
 estimation of (ZERBAN and NAQTIN), A., ii, 902.
 volumetric estimation of (LING and JONES), A., ii, 541; (LING and KENDLE), A., ii, 542.
 volumetric estimation of, by Fehling's solution (WATTS and TEMPANY), A., ii, 437.
 the reduction of cuprous oxide in the estimation of (STANF), A., ii, 638.
Sugars. See also Carbohydrates.
Sulphanilic acid. See Aniline-*p*-sulphonic acid.
Sulphates. See under Sulphur.
Sulphides. See Metallic sulphides, Polysulphides, and under Sulphur.
Sulphination of phenolic ethers and the influence of substituents (SMILES and LE ROSSIGNOL), T., 745; P., 61.
Sulphines and sulphoxides (HOFMANN and OUF), A., i, 84.
Sulphinic acids, preparation of (KNOVENAGEL and KENNER), A., i, 979.
 and sulphonic acids, aromatic, alkaloidal salts, and their rotatory power (HILDITCH), T., 1620; P., 195.
Sulphoacetic acid, chloro-, strychnine salts, and their optical activity (POTZ and READ), T., 795; P., 99.
4 Sulpho-2-aminophenyl-*p*-toluenesulphonic acid, sodium salt (CASSELLA & CO.), A., i, 785.
4-*p*-Sulphobenzeneazo-1-dimethylnaphthylamine and its sodium salt (SCHARWIN and KALLANOFF), A., i, 704.
4-*p*-Sulphobenzeneazo-*o*-phenylene-tetramethyldiamine and its alkali salts (SCHARWIN and KALLANOFF), A., i, 704.
***o*-Sulphobenzeneazosalicilic acid** (GRANDROUIN and GUISAN), A., i, 927.
Sulphobenzylethyl-*o*-butylsilyl oxide, metallic, bornylamine, cinchonidine, cinchonidine hydrogen, and menthylamine salts (LITTE and KIRCHSE), T., 2010; P., 224.

Synthetisor (JOVITSCHITSCH), A., i, 118.
Syphon pipette. See Pipette.

T.

d-**Tallitol**, preparation and properties of crystallised (BERTRAND and BRUNEAU), A., i, 249.
d-**Talose**, isolation of (BLANKSMA and ALBERDA VAN EKKENSTEIN), A., i, 951.
Tamus communis, pectins from the fruit of (BRIDEL), A., ii, 125.
Tanacetone (*thujone*), identification of, in liqueurs (DUPARC and MONNIER), A., ii, 995.
Tannic acid in toxicological investigations (BIGINELLI), A., i, 40.
 condensation products of, with formaldehyde and the phenols (HILDEBRANDT), A., i, 135.
 action of reducing agents on (GARDNER and HODGSON), P., 272, 273.
 estimation of (GARDNER and HODGSON), P., 273.
Tannic acid, quinine salts (BIGINELLI), A., i, 562.
 solubilities of true and false (MURARO), A., i, 451, 1004.
Tannin (NIERENSTEIN), A., i, 40.
 constitution of (NIERENSTEIN), A., i, 90, 897.
 titration of, by means of iodine (JEAN), A., ii, 76.
Tannins, constitution of (LOYD), A., i, 347.
 estimation of, in white wines (KOEHNER), A., ii, 240.
Tannin-phenylmethane and -thymol-methane and its bromo-derivative (HILDEBRANDT), A., i, 185.
Tanning, new method of (MEUNTER and SEYFERTZ), A., i, 586.
Tanning material, some oxides as (LUPPO-CRAMER), A., i, 377.
Tanning processes, changes in (HERZOG and ADLER), A., ii, 262.
Tantalum compounds (BALKE and SMITH), A., ii, 1045.
Taramellite, a new silicate of barium and iron (TACCONI), A., ii, 863.
Tarbuttite from Rhodesia (SPENCER), A., ii, 897.
Tarragon oil, constituents of (DAUFRESNE), A., i, 436.

- Tarragon oil**, levorotatory component of (DAUFRESNE and FLAMENT), A., i, 558.
- presence of *p*-methoxycinnamaldehyde in (DAUFRESNE), A., i, 19; (DAUFRESNE and FLAMENT), A., i, 558.
- Tartar**, Goldenberg method for the estimation of tartaric acid in (CHEMISCHE FABRIK VORM. GOLDBERG, GEROMONT & Co.), A., ii, 237.
- d*-**Tartaric acid** and sodium molybdate, formation of compounds in solutions of (QUINET), A., i, 713; (GROSSMANN), A., i, 854.
- natural and added, in natural wines (ASTUC and MAHOUX), A., ii, 992.
- detection of, in cider (LE ROY), A., ii, 237.
- estimation of, in presence of malic and succinic acids (GOWING-SCOPES), A., ii, 905.
- estimation of, in argol and wine lees (POZZI-ESCUOT), A., ii, 740.
- estimation of, in wines by evaporation (MESTREZAT), A., ii, 1078.
- Goldenberg method for the estimation of, in wine dregs, tartar, and other crude materials (CHEMISCHE FABRIK VORM. GOLDBERG, GEROMONT & Co.), A., ii, 237.
- Tartaric acid**, antimonyl sodium salt (PLUMMER), A., i, 129.
- barium and calcium salts, decomposition of, by alkali chlorides (CANTONI and JOLKOWSKY), A., i, 128.
- bismuth salt (TELLE), A., i, 851.
- calcium salt, fermentation of (EMMERLING), A., ii, 772.
- basic ferric salt (ROSENTHALER and SIEBER), A., i, 216.
- Tartaric acid**, ethyl ester, rotation of, in aliphatic halogen derivatives (PATTERSON and THOMSON), T., 355.
- rotation of, in aromatic halogen derivatives (PATTERSON and McDONALD), T., 936; P., 125.
- rotation of, in aromatic nitro-derivatives (PATTERSON), T., 1836; P., 216.
- methyl hydrogen ester, crystallography of (TANNHAUSER), A., i, 713.
- Tate's laws** and the weight of a falling drop (MORGAN and STEVENSON), A., ii, 356; (MORGAN and HIGGINS), HIGGINS, A., ii, 668.
- Tautomerism**, RABE, SPENCE, and EHRENSTEIN, A., i, 539.
- the endo-ketonic (DUNSTAN and STUBBS), T., 1919; P., 224.
- Taxe**, application of biochemical methods for the detection of glucosides and sugars in plants of the tribe (LEFEBVRE), A., ii, 57.
- Tea leaves**, composition of, at various stages of development (SAWANTRY), A., ii, 125.
- Teeth**, chemical investigations on (GLASSMANN), A., ii, 609.
- Telluride ores**, assay of (BORROWMAN), A., ii, 777.
- Tellurides**. See under Tellurium.
- Tellurium**, native, from Asia Minor (CESARO), A., ii, 861.
- atomic weight of (MARKWALD), A., ii, 33; (BAKER), A., ii, 483.
- is, a mixture of two elements? (BEITEL), A., ii, 372.
- homogeneity of (LENHER), A., ii, 452.
- the ultimate rays of (DE GEORANT), A., ii, 645.
- radioactive. See Radium F.
- cryoscopic constant of (PÉLADON), A., ii, 687.
- action of various anhydrous chlorides on (LENHER and HILL), A., ii, 484.
- Tellurium compounds** with arsenic and bismuth (PÉLADON), A., ii, 687.
- Tellurium dioxide**, action of various anhydrous chlorides on (LENHER and HILL), A., ii, 484.
- Tellurides**, selenides, and sulphides, aromatic, and their halogen additive compounds, melting and boiling points of (LYONS and BRISH), A., i, 417.
- Tellurium dicyanide** and its compound with ether (COCKSEDGE), T., 217; P., 269.
- Tellurium**, estimation of (LENHER and HOMBERGER), A., ii, 426.
- Teloidine** and its additive salts PYMAN and REYNOLDS, T., 298; P., 294.
- Temperature**. See under Thermodynamics.
- Terbium chloride**, nitrate, *p*-oxide, and sulphate (URBAIN and JANINCH), A., ii, 189.
- Terephthalic anhydride** (BUCHER), A., i, 792.
- Terpene**, $C_{10}H_{16}$ from methyl dihydrocarveol xanthate (TSCHUGAEFF), A., i, 94.
- Terpene compounds**, resolution of linkings by addition of water to (WALLACH), A., i, 429.
- fatty, reduction of (ENGLADE), A., i, 664.
- Terpene and camphor series**, investigations in the (TSCHUGAEFF), A., i, 93.

- Terpenes and ethereal oils (WALLACH, EVANS, CHURCHILL, MALLISON, MENDELSSOHN-BARTHOLODY, and RENTSCHLER), A., i, 402; (WALLACH and HEYER), A., i, 424; (WALLACH), A., i, 425, 429, 813, 997; (WALLACH and VITCK), A., i, 809; (WALLACH, HEYER, and MEISTER), A., i, 811.
- from the Philippines and essential oils (BACON), A., i, 814, 815.
- contributions to the chemistry of the (HENDERSON and HELBRON), T., 258; P., 31.
- experiments on the synthesis of (HAWORTH and PERKIN), T., 573; P., 64; (FISHER and PERKIN), T., 1871, 1876; P., 228.
- iso*Terpenes, Flawitzky's (KREMERS), A., i, 434.
- Terpin, $C_{12}H_{22}O_3$, and its dibromide and dichloride, from sabina ketone (WALLACH and HEYER), A., i, 813.
- Terpin, some reactions of (ISSARD), A., ii, 908.
- Terpinene and its modifications (WALLACH), A., i, 813.
- constitution of (HARRIES and MAJIMA), A., i, 733.
- Terpinen-4-ol, formation of, from sabinene hydrate (WALLACH), A., i, 430.
- Terpinen-1 and -4-ols, synthesis of, and their degradation products (WALLACH, HEYER, and MEISTER), A., i, 811.
- α -Terpineol, homologue of, from ethylnopinol (WALLACH), A., i, 431.
- l*- α -Terpineol and its nitrosochloride and nitropiperidide, and its oxidation (WALLACH), A., i, 431.
- Terpinols, *d*- and *l*-, synthesis of (FISHER and PERKIN), T., 1871; P., 228.
- Terrya micifera*, oil of (KAMETAKA), A., i, 851.
- Tertiary bases reaction, definition of the term (WEDEKIND and HAEUSSERMANN), A., i, 671.
- Test-tube holder, new form of (STOLTZENBERG), A., ii, 1027.
- Tetanus toxin, material in the brain which unites with (TAKAKI), A., ii, 521.
- Tetra-acetoxyp-xylene (FICHTER and WILKS), A., i, 658.
- Tetra-acetyl-. See under the parent substance.
- Tetra-alkylammonium salts, viscosity of (TAYLOR and MOORE), A., ii, 818.
- p*-Tetra-aminyltetrazen (WIELAND), A., i, 1026.
- Tetra-arylhydrazines, decomposition of (WIELAND), A., i, 1014.
- $\alpha\alpha\beta\beta$ -Tetrabenzylbutan- $\alpha\beta$ -diol (HOUBEN and HAHN), A., i, 540.
- s*-Tetraethylaminodimethylcarbamide (EINHORN), A., i, 611.
- Tetraethylaminodimethyltartramide (EINHORN), A., i, 611.
- Tetraethylammonium iodide, conductivity and viscosity of, in water, methyl alcohol, ethyl alcohol, and nitrobenzene, and in binary mixtures of these solvents (JONES and VEZEY), A., ii, 260.
- solvent power and dielectric constant of (WALDEN), A., ii, 159.
- Tetraethylhydrofuran (HOUBEN and HAHN), A., i, 540.
- Tetraethylthionine and its derivatives (GHEM and SCHINDLER), A., i, 110.
- Tetrahydrocridine and its derivatives and β -carboxylic acid and its salts (BORSCH, TIEDTKE, and LOTTISPER), A., i, 682.
- Tetrahydrocloesol, *tetrachloro*-, and its acetyl derivative (LEGER), A., i, 980.
- Δ^{10} -Tetrahydrobenzo- α - and - β -naphthindoles (BORSCH, WITTE, and BOTHE), A., i, 366.
- Tetrahydrocarbazole, derivatives of (BORSCH, WITTE, and BOTHE), A., i, 365.
- cis*-Tetrahydrocarvestrenediol, synthesis of (FISHER and PERKIN), T., 1889.
- Tetrahydrocolumbamine methyl ether (FEIST), A., i, 102.
- Tetrahydrodi-coumaric acids and -coumarins, α - and β - (FRIES and FICKEWIRTH), A., i, 823.
- Tetrahydrodi-4:6-dimethylcoumarins, α - and β - (FRIES and FICKEWIRTH), A., i, 824.
- Tetrahydrodavanthrens, α - and β -, and their derivatives (SCHOLL and HOLDERMANN), A., i, 697.
- Tetrahydrofuran (BOURGUIGNON), A., i, 280.
- Tetrahydrojateorrhizine (FEIST), A., i, 103.
- Tetrahydrolinalool (β -*dimethyloctano- ζ -ol*), synthesis of (ENKLAAR), A., i, 934.
- Tetrahydropalmitine and its aurichloride (FEIST), A., i, 103.
- Δ^3 -Tetrahydropyridine, 3-carboxylic acid of, and its additive salts, and 3-cyano- (WOHL and LOSANTSCH), A., i, 47.
- Δ^3 -Tetrahydropyridine-3-aldehyde and its oxime and their hydrochlorides and 1-benzoyl and 1-*m*-nitrobenzoyl derivatives (WOHL and LOSANTSCH), A., i, 46.
- Tetrahydropyrone compounds (PETRENKO-KRITSCHENKO and DEMEN-TEYEFF), A., i, 560.

- Tetra-2:4 *d*-hydroxytritanol**, derivatives of (V. LIEBIG), A., i, 447.
- 2:3:4:5-Tetramethoxy-1-allylbenzene** (THOMS), A., i, 902.
- Tetramethoxyanthraquinone** (BENTLEY and WEIZMANN), T., 437; P., 52.
- 2:3:4:5-Tetramethoxybenzoic acid** (THOMS), A., i, 902.
- Tetramethoxy-2-benzoylbenzoic acid and hydroxy-** (BENTLEY and WEIZMANN), T., 437; P., 52.
- 7:8:4':5'-Tetramethoxy-4:3 indenobenzopyranol(1:4)** anhydroferriehloride (ENGELS, PERKIN, and ROBINSON), T., 1152.
- 2:4:3':4'-Tetramethoxy-6-methylbenzoyl-acetophenone** (TAMBORI), A., i, 350.
- 2:6:3':4'-Tetramethoxy-4-methylbenzoyl-acetophenone** (TAMBORI), A., i, 359.
- α -4:5:6'-Tetramethoxy- β -phenoxy- β -phenylisobutyric acid, 2:2'-dihydroxy-**, lactone of (ENGELS, PERKIN, and ROBINSON), T., 1161.
- Tetramethyl-2:4-/aminobenzaldehyde** and its salts (SACHS and APPENZELER), A., i, 186.
- Tetramethyl-/aminobenzhydrol**, constitution of the compounds of, with some methylenic derivatives (FOSSE), A., i, 567, 568.
- and benzenazo- α -naphthol, constitution of the acetates from, and condensation products from (AUWERS and EISENLOHR), A., i, 229; (MÖHLAU), A., i, 374.
- Tetramethyl-*p*-/aminobenzylbenzhydrol** (GUYOT and PIGNET), A., i, 569.
- Tetramethyl-2:4-/aminobenzylidene-acetophenone**, cyanoacetic acid, ethyl ester, hydrazine, malononitrile, β -nitrobenzylcyanide, and rhodanic acid (SACHS and APPENZELER), A., i, 187.
- 4-Tetramethyl-2:4-/aminobenzylidene-1-phenyl-3-methyl-5-pyrazolone** (SACHS and APPENZELER), A., i, 187.
- Tetramethyl-/aminobenzylphenylsulphone** (BINZ and ISAVO), A., i, 249.
- Tetramethyl-/aminodiphenylglycine-amide** (HINENBERG), A., i, 153.
- Tetramethyl-/aminodiphenylmethane**, constitution of the methylenic derivatives of (FOSSE), A., i, 568.
- 4:4-Tetramethyl-/aminodiphenylmethane dioxide and its derivatives** (BAMBERGER and RUDOLF), A., i, 1011.
- 4:4'-Tetramethyl-/aminodiphenyl-tolylmethane**, 2- and 4-amino-, and their oxidation (BIELECKI and KOLESIEN), A., i, 628.
- Tetramethyl-/diaminophenyl-ethylcarbinol and -hydroxy-/richloroethane** (SACHS and APPENZELER), A., i, 187.
- Tetramethyl-2:4-/diaminotriphenylmethane** (SACHS and APPENZELER), A., i, 188.
- 4:4'-Tetramethyl-/diaminotriphenylmethane dioxide and its derivatives** (BAMBERGER and RUDOLF), A., i, 1012.
- Tetramethylammonium bromide**, *salicyano-* (V. BRAUN), A., i, 608.
- s-Tetramethylbenzidine**, *s-s-dicyano-* (V. BRAUN), A., i, 625.
- Tetramethyl bromo- and chloro-glucose** (IRVINE and MOODIE), T., 105.
- 1:3:4:7-Tetramethylcarbazole and its picrate** (BORSCHKE, WITTE, and BOHNE), A., i, 367.
- Tetramethylcoumarins**, 3:4:6:7-3:4:6:8, 3:4:5:7-, and 4:5:6:8-, formation of (CLAYTON), T., 2019.
- Tetramethyldihydrobrazilein** and its oxidation (ENGELS, PERKIN, and ROBINSON), T., 1135.
- Tetramethyldihydrohemateinol** (ENGELS, PERKIN, and ROBINSON), T., 1142.
- Tetramethyldinaphthantheracene**. See Picene, alkyl derivative.
- Tetramethylcellogie acid**, preparation and reactions of (HERZIG and POLAK), A., i, 547.
- cyclo*-**Tetramethylene**. See *cyclo*-Butane.
- Tetramethylenediamine**. See Putrescine.
- Tetramethylethyl-/aminodiphenyl-naphthylcarbinol**. See Victoria Blue R.
- Tetramethylethylene oxide**, relation of, to pinacolm (DELAURE), A., i, 242.
- Tetramethyl glucose**, derivatives of (IRVINE and MOODIE), T., 95.
- Tetramethyl glucosamine** and its attempted alkylation (IRVINE and MOODIE), T., 103.
- Tetramethyl glucosamine and its alkylation** (IRVINE and MOODIE), T., 109.
- Tetramethylhematein** (ENGELS, PERKIN, and ROBINSON), T., 1141.
- 1:1-4:4-Tetramethyl-/hexan-3-one, 4-dichloro-** (AUWERS and HESSELBAUM), A., i, 551.
- 1:4:5:8-Tetramethylnaphthalene**, absorption spectra of (HOWER and PREVINS), T., 1321; P., 117.
- $\alpha\alpha$ 8(6-Tetramethyl- Δ^8 -octenoic acid** (*madimeth- $\alpha\beta$ -dihydroacetic acid*), β -hydroxy- (TIEFFENAU), A., i, 599.
- Tetramethylsparteinium dihydroxide** (MOPPER and VALLEJO), A., i, 43.
- 1:4:6:6-Tetramethyl Δ^4 -tetrahydro-2-pyridone** and its additive salts (PICCINIS), A., i, 51.

- 1:4:6:6-Tetramethyl- Δ^3 -tetrahydro-2-pyridone**, 3-amino-, and its platinum-chloride, and 3-hydroxy- (PICCINI), A., i, 908.
- 1:4:6:6-Tetramethyl- Δ^3 -tetrahydro-2-pyridone-3-carboxylic acid** and its amide and salts (PICCINI), A., i, 679.
- Tetranaphthyl**, absorption spectra of (HOMER and PURVIS), T., 1321; P., 147.
- Tetranthera polyantha* var. *citrata*, oil from the bark, leaves, and fruit of (CHARABOT and LALOUÉ), A., i, 279; ROURE-BÉTRAND FILS, A., i, 558.
- Tetraphenylaminobiuret** (MICHAELIS), A., i, 471.
- $\alpha\beta\gamma$ -Tetraphenylbutyrolactone** (REIMER and REYNOLDS), A., i, 989.
- Tetraphenyldiethylamine** and its nitroso-amine (BUSCH and LEEFHELM), A., i, 152.
- s-Tetraphenylethane** (ODDO), A., i, 748.
- Tetraphenylhydrazine**, decomposition of, with hydrogen chloride (GAMBARJAN), A., i, 1016.
- Tetraphenylmethylenediamine** (HOUBEN and ARNOLD), A., i, 534.
- Tetraphenyl- α -naphthaquinodimethane** (STÄUDINGER), A., i, 411.
- Tetraphenylquinodimethane** and bromo-, preparation of (TSCHITSCHIBARIN), A., i, 872.
- Tetraphenylxyloquinodimethane** (STÄUDINGER), A., i, 411.
- Tetrathionates**. See under Sulphur.
- p-Tetratolyltetrazen** (WIELAND), A., i, 1026.
- Tetrazens**, aromatic (WIELAND), A., i, 1026.
- Tetrazinedicarboxylic acid**, ethyl ester and salts (MÜLLER), A., i, 923.
- azomide of (CURTIS and RIMELE), A., i, 921.
- Tetrolie acid**, γ -hydroxy- (LESPIEAU and VIGUIER), A., i, 125.
- Thalleoquinine reactions**, quantitative relations of the (VONDRASEK), A., ii, 997.
- Thallium**, interaction of, with organic halogen compounds (SPENCER and WALLACE), T., 1332; P., 194.
- Thallium alloys** with calcium (DOŠSKI), A., ii, 279.
- with cobalt (LEWKONJA), A., ii, 853.
- with nickel (VOSS), A., ii, 195.
- with platinum (HACKSTILL), A., ii, 504.
- Thallium oxides** (RABE), A., ii, 498.
- sulphate and uranyl sulphate, double salt of (KOHN), A., ii, 696.
- Thallous salts**, new reaction of (EPHRAÏM), A., ii, 591.
- Thallium molybdenum thiocyanate** (ROSENHEIM and GARFUNKEL), A., i, 614.
- Thallium**, electrolytic estimation of, and probable existence of a new oxide of (GALLO and CENNI), A., ii, 986.
- quantitative separation of, from silver (SPENCER and LE PLA), T., 958; P., 75.
- Thallium ion**, subvalent, existence in aqueous solutions of a (DENHAM), T., 833; P., 76.
- Thallous salts**. See under Thallium.
- Thallylaminoacetoneitrile** (v. BRAUNS), A., i, 628.
- Thea japonica*, oil of. See Camellia oil.
- Thebaine**, constitution of (BUCHERER), A., i, 43.
- action of ozone on (RIEDEL), A., i, 1006.
- ψ -Theobromine** and its additive salts (SCHMIDT and SCHWABE), A., i, 45.
- Theophylline**, alkyl derivatives of (SCHWABE), A., i, 45.
- THERMOCHEMISTRY**—
- Thermochemistry**, calculation of hydrocarbon equilibria (v. WARTEMBERG), A., ii, 26, 676.
- Thermochemical constants**, calculation of (REDGROVE), A., ii, 463, 564, 812.
- equivalence, and the thermochemistry of nitrogen (THOMLINSON), A., ii, 1016.
- evidence of v. Baeyer's strain theory (REDGROVE), A., ii, 758.
- Thermodynamic calculation** of electromotive forces (HALLA), A., ii, 755.
- Thermodynamics**, outline of a new system of (LEWIS), A., ii, 16.
- of cells with fused electrolytes (LORENZ and FOX), A., ii, 656.
- of liquid cells (HENDERSON), A., ii, 653.
- of cells with solid substances (LORENZ and KATAYAMA), A., ii, 249.
- of non-homogeneous mixtures (BOSE and CLARK), A., ii, 84.
- of salts containing water of crystallisation (SCHOTTKY), A., ii, 1016.
- of the sulphur chloride equilibrium, $\text{SO}_3 + \text{Cl}_2 \rightleftharpoons \text{SO}_2\text{Cl}_2$ (TRAUTZ, BAISCH, and v. DECHEND), A., ii, 569.
- Heat-contents of binary systems** (TAMMANN), A., ii, 660.
- Heat power**, curves of instantaneous, determined from chemical reactions (MIELT), A., ii, 153.
- Thermal analysis**. See Analysis.

THERMOCHEMISTRY:—

- Thermal expansion**, compressibility, atomic volume, and atomic heat of metals, relation between (GRÜNEISEN), A., ii, 563.
and specific heat of metals (GRÜNEISEN), A., ii, 563.
- Atomic heat**, atomic volume, thermal expansion, and compressibility of metals (GRÜNEISEN), A., ii, 563.
- Atomic heats**, theory of Dulong and Petit's law (RICHARZ), A., ii, 562, 659.
- Specific heat and molecular magnetic field** of ferromagnetic substances (WEISS and BECK), A., ii, 659.
and osmotic pressure of solutions (v. BIRON), A., ii, 459.
measurement of the variation of, with temperature (LECHER), A., ii, 83.
and thermal expansion of metals (GRÜNEISEN), A., ii, 563.
of some elements and salts between the temperature of liquid air and room temperature (NORDMYER), A., ii, 353.
of solid elements and Dulong and Petit's law (WIGAND), A., ii, 13; (ROHLAND), A., ii, 459.
of liquids, new method for determining the (RICHARDS and ROWE), A., ii, 806.
of isomorphous substances and their mixtures (BOGOLAWIENSKY and WINOGRADOFF), A., ii, 896.
- Heat of combustion** of carbamides and alkyl argenticyanides (GUTHLEMAIR), A., i, 719.
of organic compounds, determination of the, by the platinum resistance thermometer (FISCHER and WREDE), A., ii, 155.
- Heat of formation** of organic fluorocompounds (SWARTS), A., ii, 354.
of quadrivalent oxygen compounds (McINTOSH), A., ii, 355.
- Heats of neutralisation**, hydrolysis as illustrated by (VELEY), A., ii, 813.
- Heat of fusion**, specific cohesion, and molecular weight at the melting point (WALDEN), A., ii, 1614.
- Latent heats of fusion** of isomorphous substances and their mixtures (BOGOLAWIENSKY and WINOGRADOFF), A., ii, 896.
- Critical temperatures**. See under Critical.
- Calorimetric study** of slow reactions (DECELAN), A., ii, 154.
- Temperature**, and electrical conductivity, relation between (RASCH and HINRICHSSEN), A., ii, 119.

THERMOCHEMISTRY:—

- Temperature and pressure** in relation to orthobaric volumes (HARGREAVES), A., ii, 813.
- Temperatures**, constant, in drying ovens, appliance for (HALLMANN), A., ii, 17.
high, and high pressures, apparatus for experiments at (THRELLALL), T., 1333; P., 131.
low, application of, to some chemical problems (DEWAR and JONES), A., ii, 258.
very low, use of, for spectrum analysis, and for the study of magneto-optical phenomena of solutions (BECQUEREL), A., ii, 3.
- Temperature coefficient** and ionic mobility, relation between (RASCH and HINRICHSSEN), A., ii, 119.
of ionic mobilities in water as a function of the mobilities (RASCH and HINRICHSSEN), A., ii, 118; (KOHLETSCH), A., ii, 261.
- Temperature velocities** of various physiological actions (SNYDER), A., ii, 768.
- Ignition temperature** and vapour pressure of inflammable liquids at low boiling point, relation between (CHARITSCHKOFF), A., ii, 255.
- Transition points**, determination of (DUNSTAN and THOLE), T., 1312; P., 213.
- Transition temperatures**, influence of foreign substances on, and the determination of molecular weights (DAWSON and JACKSON), T., 244; P., 26.
- Calorimeter**, bomb, modified (BRYGADE), A., ii, 255.
- Thermometer**, gas, measurements with (DAY and CLEMENT), A., ii, 1013.
pentane, scale of the (HOFMANN and ROTHE), A., ii, 152.
- Thermo-regulator**, a simple form of (GREEN), A., ii, 826.
- Thermostat**, water, for the normal temperature of 15° (BODAY), A., ii, 83.
- Thermostats**, glass, for higher temperatures (FISCHER and ROBERTS), A., ii, 757.
- Thermodynamics**. See under Thermodynamics.
- Thermometer**, Thermo-regulator and Thermostats. See under Thermodynamics.
- Thetines**, phenolic, and their reaction with benzoyl chloride (BARSEIT and SMILES), P., 123.

- Thianthren.** See Diphenylene *di*-sulphide.
- Thiazines** (GNEHM and WALDER), A., i, 63; (GNEHM and SCHINDLER), A., i, 110; (GNEHM and SCHÖNHOLZER), A., i, 112.
- Thienyl-dimethylcarbinol, -dipropylcarbinol, -heptylene, and -propylene** (THOMAS), A., i, 360.
- Thio-aldehydes, formation of** (VANINO), A., i, 318.
- Thioamides, constitution of** (BILMANN), A., i, 142.
- Thioantimonic acid.** See under Antimony.
- Thiocarbamide** (GROSSMANN), A., i, 10. and ammonium thiocyanate, isomerism of (PATTERSON and McMILLAN), T., 1049; P., 135. preparation of soluble and stable additive compounds of, with silver salts (FARBENFABRIKEN FORM. F. BAYER & Co.), A., i, 613.
- Thiocarbamides, reactions of, with acid chlorides** (DIXON and TAYLOR), T., 18.
- Thiocarbamidodiacetonitrile and its isomeride** (V. MEYER and LEHMANN), A., i, 910.
- 6-Thiocarbamido-2-*p*-tolyl-4-methylpyrimidine** (JOHNSON, STOREY, and McCOLLUM), A., i, 838.
- Thiocarbimides, action of, on the ethyl esters of malonic and cyanoacetic acids** (RUEHMANN), T., 621; P., 53.
- Thiocyanates, containing an electronegative group, constitution of** (DIXON and TAYLOR), T., 684; P., 73. action of iodine on (PFEIFFER and TILGNER), A., i, 614.
- Thiocyanic acid, constitution of** (PALAZZO and SCALZI), A., i, 718. action of certain oxidising agents on (BONGIOVANNI), A., i, 770, 859. detection of, by means of mercurous chloride (POLLACCI), A., ii, 782.
- Thiocyanoselenious acid.** See under Selenium.
- Thiocyano-.** See also under the parent Substance.
- Thiozanuric acid.** See under Cyanuric acid.
- Thiomethyl-1,5-diphenylpyrazole and its 4-nitroso-derivative and sulphone** (MICHAELIS and WILLERT), A., i, 214.
- Thiomethyl-1,3-diphenylpyrazole and its 1-*m*-nitro-derivative and their sulphones** (MICHAELIS and WILLERT), A., i, 215.
- thionaphthen and its derivatives** (BEZDIK, FRIEDLÄNDER, and KOENIGER), A., i, 200.
- Thionaphthen derivatives, synthesis of, from styrenes and thionyl chloride** (BARGER and EWINS), T., 2086; P., 237.
- Thionaphthen, -hexachloro- and 1:2-dichloro-4:5(or 5:6)-dihydroxy-, and its benzoyl derivative** (BARGER and EWINS), T., 2086; P., 238.
- 3-hydroxy-, preparation of, and its 2-carboxylic acid** (KALLE & Co.), A., i, 360, 451.
- 3-hydroxy-, preparation of, and a red dye from it** (KALLE & Co.), A., i, 678. preparation of the leuco-derivative of colouring matter obtained by oxidation from (KALLE & Co.), A., i, 785.
- Thionaphthen-3-aldehyde, 2-hydroxy-** (FRIEDLÄNDER), A., i, 373.
- Thionaphthen-2-carboxylic acid, 3-hydroxy-, preparation of** (KALLE & Co.), A., i, 797.
- 3-hydroxy-, preparation of, and a red dye from it** (KALLE & Co.), A., i, 673.
- dihydroxy-, preparation of** (FARBWERKE FORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1004.
- Thionaphthenindoleindigotins.** See Indoxylthionaphthenones.
- Thionoxal-*p*-chloroanilide, -4-cumide, -*p*-phenetide, and - α - and - β -naphthylamides** (FRIEDRICH and WILDT), A., i, 414.
- Thionoxalotoluidides, *o*-, *m*-, and *p*-** (FRIEDRICH and WILDT), A., i, 413.
- Thionyl chloride.** See under Sulphur.
- Thionylidglycollic acid and its salts, preparation of** (GAZDAR and SMILES), T., 1834; P., 216.
- Thiophen, derivatives of** (THOMAS), A., i, 360.
- Thiophten, bromo-derivatives** (CAPELLE), A., i, 201.
- 3-Thiopyrine, 1-*m*-nitro-** (MICHAELIS and STIEGLER), A., i, 213.
- Thiosulphonates, action of arsenites and cyanides on** (GUTMANN), A., i, 972. volumetric estimation of (GUTMANN), A., ii, 544.
- Thiosulphuric acid.** See under Sulphur.
- Thiozone and its derivatives** (ERDMANN), A., ii, 831.
- Thiozonides** (ERDMANN), A., ii, 830.
- Thio-.** See also under the parent Substance.
- Thoria.** See Thorium oxide.
- Thorianite, new elements in** (EVANS), T., 668; P., 60; (OGAWA), A., ii, 952, 953.

Thorium and helium, association of, in minerals (STEVUT), A., ii, 144.
 presence of, in the soil at Rome (BLANC), A., ii, 248, 452.
 quantitative spectra of (LEONARD), A., ii, 645.
 relative activity of emanation and active deposit from (BRONSON), A., ii, 792.
 emanation and actinium emanation, condensation of (KINOSHITA), A., ii, 652.
 specific radioactivity of, and the variation of the activity of, with chemical treatment and with time (McCox and Ross), A., ii, 81.
 distribution in electric fields of the active deposits of (RUSS), A., ii, 552.
 rate of production of helium from (SOODY), A., ii, 921.
Thorium alloy with nickel (CHAUVENET), A., ii, 558.
Thorium compounds, nomenclature of (HAHN), A., ii, 454.
Thorium salts, abnormal behaviour of, on hydrolysis of (DENHAM), A., ii, 380.

transformation of glycogen by enzyme
action in (MENDEL and SAIKI),
A., ii, 207.
embryonic muscular and nervous
(MENDEL and LEAVENWORTH), A.,
ii, 207.
Titanic sulphate. See under Titanium.
Titanium compound with aluminium
(MANCHOT and RICHTER), A., ii, 40.
Titanofluoride, hydroxylamine deriva-
tive (EBLER and SCHOTT), A., ii,
1031.
Titanium nitride (RUFF and EISENER),
A., ii, 700.
nitrogen haloids, new (RUFF and
EISENER), A., ii, 700.
phosphide (GEWECKE), A., ii, 597.
Titanous iodide, TiI_3 (DEFACQZ and
COPAU), A., ii, 699.
Titanic sulphate, electrolytic reduction
of solutions of (DIETHELM and
FOERSTER), A., ii, 350.
Titani-dihydroxymaleic acid (FEN-
TON), T., 1064; P., 133.
Titanium and zirconium, simultaneous
precipitation of, in presence of iron
(DITTRICH and FREUND), A., ii,
134.
detection of (FENTON), T., 1064; P.,
133.
estimation of, volumetrically (NEW-
TON), A., ii, 325; (GALLO), A., ii,
780.
separation of, from thorium (DITTRICH
and FREUND), A., ii, 134.
separation of thorium, zirconium, and,
from iron (DITTRICH and FREUND)
A., ii, 135.
separation of, from zirconium
(DITTRICH and FREUND), A., ii,
134.
Titanous iodide. See under Titanium.
Tobacco, estimation of non-volatile
organic acids in (TÔTH), A., ii,
238.

(Tolyl compounds, $M_e=1$.)

- Tobacco**, estimation of volatile organic acids in (TÖTH), A., ii, 330.
- Tobacco smoke** (HABERMANN and EHKENFELD), A., ii, 888.
estimation of carbon monoxide in (MARCELET), A., ii, 533.
- Tolidine**, formation of, from hydrazotoluene (VAN LOON), A., i, 331.
- tolil** (EKKERANTZ and ALLQVIST), A., i, 993.
- p-Tolidioximes**, isomeric, and their behaviour as to formation of complexes (TSCHUGAEFF and SPIRO), A., i, 686.
- o-Tolualdehyde**, 3-hydroxy-, ethylene ether (GATTERMANN), A., i, 34.
- m-Tolualdehyde**, 4-hydroxy-, and its azine, synthesis of (GATTERMANN), A., i, 28.
6-hydroxy-, ethylene ether, and its derivatives, synthesis of (GATTERMANN), A., i, 34.
- p-Tolualdoxime peroxide** (TSCHUGAEFF and SPIRO), A., i, 687.
- Toluene**, benzene, and acetone, dispersion in the electric spectra of (COLLEY), A., ii, 909.
chemical dynamics of the bromination of (BRYSER and DLUSKA), A., i, 146.
simultaneous production of 1:6- and 2:5-dimethylanthracenes in the action of methylene dichloride, chloroform, or acetylene tetrabromide on, in presence of aluminium chloride (LAVAN), A., i, 151, 256.
aluminium bromide, electrolysis of (NEMINSKY and PIOTNIKOFF), A., i, 497.
- Toluene, di- ω -bromo- ω -nitro-** (PONZIO), A., i, 869.
 ω -bromo- ω -nitro-, ω -chloro- ω -nitro-, and ω - δ -nitro- and its phenylhydrazine salt (PONZIO and CHARRIER), A., i, 522.
 m -, m' -, and p -chloro- and -nitro-, oxidation of (LAW and PERKINS), T., 1634 : P., 195.
2:4-dihydroxy-. See Cresorcinol.
2:5-dihydroxy-. See Orcinol.
2:iodo-4-nitro-, derivatives of, with polyvalent iodine (WILLGERODT and KÖK), A., i, 629.
 p -nitro-, action of caustic alkalis on derivatives of (GREFEN and BADWILLY), T., 1721 : P., 291.
kinetics of the sulphonation of (MARTINSEN), A., ii, 572.
 ω -nitro-, transformation of, into the ω - δ -nitro-compound (PONZIO), A., i, 869.

(Tolyl compounds, $M_e=1$.)

- Toluene**, ω -isocitro-, velocity of formation of (PATERSON and MILLAN), T., 1048 : P., 165.
 ω - δ -nitro-, action of diazo-salts (PONZIO), A., i, 452.
- Toluenazodimethylaniline** and bromo-, coloured salts of (HANTZSCH and HILSCHER), A., i, 455.
- p-Toluenazo- β - δ -disulphthylamine** (FISCHER and STILWIS), A., i, 22.
ethyl
o-Toluenazoengenyl
(AUWERS), A., i, 229.
o-Toluenazoguaniscol and its derivative (COLOMBANO and L. ARDI), A., i, 68.
- Toluenazo- p -hydroxybenzoic acid** and p -, and their acetyl derivat and ethyl ester of the o -acid (GROUJIN and FREIMANN), A., i, 1.
o-Toluenazoinadazole and its acetyl benzoyl derivative (GRANDMOUGIN and FREIMANN), A., i, 1024.
- 4-Toluenazo-3-methyl-5-pyrazolon** and p -, and their 1-benzoyl derivat (BLOW and SCHAUB), A., i, 765.
- p-Toluenazo-orcinol**, 3:5-dihydroxy (ORTON and EVERATT), T., 1029.
o-Toluenazophenol and its 2 derivative and benzene-sulphonyl (GRANDMOUGIN and FREIMANN), i, 1023.
- m-Toluene-4-azoresorcinol**, 2:4-bromo (ORTON and EVERATT), T., 1029.
p-Toluene-4-azoresorcinol, 3:5-dihydroxy (ORTON and EVERATT), T., 1017.
- Toluenazosalicylic acids**, o -, m -, p -, and their nitro- and acetyl derivatives (GRANDMOUGIN and GU), A., i, 927.
- p-Toluenazo- ω -toluidine**, coloured of (HANTZSCH and HILSCHER), 455.
- Toluenazo-**. See also Tolyazo-.
- Toluenediazonium** bromides.
Diazotoluene bromides.
p-Toluenediazogenylyl (AUWERS), A., i, 228.
- Toluene- p -sulphinic acid** prepared (KNOVENAGEL and KESNER), 971.
- Toluene- p -sulphinic acid**, alkali salts, and their rotatory (HILDEITCH), T., 1621.
- Toluene- p -sulphinic anhydride**, preparation of (KNOVENAGEL and FOL), A., i, 971.
- Toluene-2-sulphennanilide**, 4-nitro- (MANN and GOSWAMI), A., i, 62.
- Toluene- p -sulphonic acid**, alkali salts, and their rotatory power (HILDEITCH), T., 1621.

(Tolyl compounds, $M_0=1$.)

ne-*p*-sulphonic acid, 2-amino-*p*-
-yl ester and sodium sulphobenzen-
-azo-2-amino-*p*-tolyl ester (ANILIN-
-ABFEN- & EXTRAKT-FABRIKEN
ORM. J. R. GEIGY), A., i, 1022.
-diaminophenyl ester and its
-acetyl derivative, 2:4-dinitro-
-phenyl ester, 2:4-dinitrophenyl-
-sulfonium ester, and 8:5-dinitro-
-tolyl ester (ULLMANN and NÁDAS),
..., i, 529.
-dinitro-*p*-tolyl ester (ULLMANN),
..., i, 626.
ne-*p*-thiosulphonic acid, sodium
-action of arsenites and cyanides
(GUTMANN), A., i, 972.
-acid, chlorodinitro- (two) (KUNC-
-ELL), A., i, 729.
-*o*-, and *p*-hydroxy-, hydrazine
compounds of (FRANZEN and EICH-
-JUN), A., i, 831.
nic acid, 4-hydroxy-, action of
mine on (ZISCKE and BUFF),
i, 613.
nic acid, 5-bromo-6-hydroxy-
(BREITSON), T., 789; P., 73.
nic acid, chlorotrimino-, chloro-
-mino-2-nitro-, and imino-2-nitro-,
-omeric esters of (HILFERT), A., i,
30.
-hydroxy-, preparation and reduction
(MELDRUM and PERKIN), T.,
29; P., 187.
-amides, anilides, and α -naphthal-
-yl normal fatty acids, melting
-points of (ROBERTSON), T., 1033;
..., 120.
nitine, action of dichloroacetic acid
(V. OSTROMISLENSKY), A., i, 82.
nitidine, 4-nitro-, hydrochloride of
(ILGERRODT and KOK), A., i, 620.
nitidine, preparation of, from mixed
-toluidines by means of *p*-toluidine
hydrazine (FRISWELL), A., i, 332.
-ion of glyoxylic acid on (V. OSTRO-
-MISLENSKY), A., i, 889.
-ion of ethyl pyruvate on (SIMON),
A., i, 687, 738.
nitinitrite (HOFMANN and BRU-
-NER), A., i, 875.
nitates (SUIDA), A., i, 523.
nitidine, 2-iodo-, and its salts
(ILGERRODT and GARTNER), A., i,
9.
nitines, *o*-, *m*-, and *p*-, action of di-
-chloroacetic acid on (HELLER), A.,
217.
-tines of (VIGNON and EYREUX), A.,
1, 665.
nitines, *o*- and *p*-, acetyl derivatives.
-Aceto-*o*- and *p*-toluidines.

(Tolyl compounds, $M_0=1$.)

Toluidines, *o*- and *p*-, calcium deriva-
tives of (ERDMANN and VAN DER
-SMITSEN), A., ii, 588.
1-*o*-Toluidino-4-hydroxyanthraquinone
and its acetate (GRANDMOUGIN), A.,
i, 808.
***p*-Toluidino-1-phenyltriazole**, 3:5-(or
5:3)-amino-, and its acetyl derivative
(FROMM and WELLER), A., i, 702.
2-Toluidinopyrimidines, *o*- and *p*-, 6-
-chloro-, and 6-amino- of the *o*-com-
-pound (JOHNSON, STORREY, and
-MCCOLLUM), A., i, 838.
Tolucins, *o*-, *m*-, and *p*- (EKECRANTZ and
-ANLQVIST), A., i, 993.
Toluoyl-*o*-benzoic acid, *o*- and *p*-chloro-
(HELLER and SCHLCKE), A., i, 994.
 α -*p*-Toluoyl- β -phenylhydrazine, α -nitro-
- β -nitroso- and β -nitroso- (PONZIO and
-CHARRIER), A., i, 582.
Toluquinone-2-oxime-5-*o*-mono- and
-5-*op*-di-nitrophenylhydrazones
(BOESCHE), A., i, 67.
Tolusafraninones, alkylated, preparation
of (FARBWERKE FORM. MEISTER,
-LUCIUS, & BREINING), A., i, 225.
***o*-Tolyl- β -bromoethyl ether** (GATTE-
-MANN), A., i, 32.
-trimethylene ether, and its di-4:4'-
-aldehyde (GATTERMANN), A., i,
34.
***m*-Tolyl ethylene ether** (GATTERMANN),
A., i, 34.
***p*-Tolyl benzoate**, *o*-nitro-, and its reduc-
-tion (AUWERS), A., i, 477.
Tolyl arsenites, *o*-, *m*-, and *p*- (LANG,
-MACKEY, and GORTNER), T., 1370.
-glycerol ethers, *o*-, *m*-, and *p*-
(SCHIVKOVITCH), A., i, 973.
***p*-Tolylacetaldehyde** and its derivatives
(KLING), A., i, 188.
***p*-Tolylacetone**, isonitroso- (PONZIO
and GIOVETTI), A., i, 835.
Tolylamine. See Toluidino-.
***p*-Tolylanthroxan** (KUEGL), A., i, 550.
Tolyl-5-arsinic acid (tolyl-5-*arsonic acid*),
2-amino-, and its sodium salt and
its *N*-acetyl derivative (PYMAN and
-REYNOLDS), T., 1181; P., 143; (D.
-and R. ADLER), A., i, 592.
2-hydroxy-, sodium salt (BARROW-
-CLIFF, PYMAN, and REMFERY), T.,
1896.
Tolylarsinic acids (tolylarsonic acids),
amino-, and their acetyl derivatives
(BENDA and KAHN), A., i, 592.
Tolylazoacetoacetic acids, *o*- and *p*-,
ethyl esters, and their benzoylhydr-
-azones (BÜLOW and SCHAUB), A., i,
705.
Tolylazo. See also Tolueneazo-.

(Tolyl compounds, $Me=1$.) β -*p*-Tolylbenzylhydrazine and its hydrochloride and benzoyl derivative (SCHLENK), A., i, 738.*p*-Tolylbenzylidenethydrizine (SCHLENK), A., i, 738.*p*-Tolylbenzylmethylallylammonium iodide and hydrogen tartrate, resolution of (EVERATT and JONES), T., 1790; P., 212.*p*-Tolyl- ψ -benzylthiocarbamide, cyano- (FROMM and WELLER), A., i, 703.*o*-*m*-Tolyl- Δ -butylene and its dibromide (GRISHKEWITSCH-TROCHIMOWSKY), A., i, 739.Tolylcarbamic acids, *o*- and *p*-, calcium salts (ERDMANN and VAN DER MISSEN), A., ii, 588.*p*-Tolylcarbamide, 2-iodo-, and its *N*-nitroso-derivative (WILLGERODT and GARTNER), A., i, 876.*o*-Tolyl chloromethyl ketone, 5-chloro- (3-chloro-6-chloroacetylthiobenzene) (KUNCELL), A., i, 729.*N*-Tolylidiacetonitriles, *o*-, *m*-, and *p*-(v. MEYER and SCHUMACHER), A., i, 909.*p*-Tolyl dimethylcyanomethylammonium iodide (v. BRAUN), A., i, 628.5-*p*-Tolyl 5:5-dimethylhydantoin (BAILEY and RANDOLPH), A., i, 742.Tolylethyl alcohols, *o*-, *m*-, and *p*- (KLING), A., i, 989.*m*-Tolyl ethyl ketone and its oxime and semicarbazone (WALLACH and RENTSCHLER), A., i, 495. β -*m*-Tolyl- α -ethylpropionic acid, β -hydroxy-, synthesis and properties of, and its ethyl ester and salts (GRISHKEWITSCH-TROCHIMOWSKY), A., i, 799. β -*p*-Tolylglutaric acid, nitration of, and its 3-nitro-5-amino-derivative (AVERY and UPSON), A., i, 796.*p*-Tolylguanido-*p*-tolyl- ψ -benzylthiocarbamide (FROMM and WELLER), A., i, 701.*p*-Tolylguanido-*p*-tolylthiocarbamide and its acetyl derivative and its anhydro-compound (FROMM and WELLER), A., i, 701.3-*p*-Tolylhydantoic acid and its ethyl ester (BAILEY and RANDOLPH), A., i, 741.*o*-Tolylidenacetone (MEERWEIN), A., i, 90.*p*-Tolylidenecarbamidoxime (CONDEHN), A., i, 155.*o*-Tolylidenemalonic acid, methyl ester (MEERWEIN), A., i, 90.*p*-Tolylmethylaminoacetonitrile, *o*-bromo-, and its platinumchloride and picrate (v. BRAUN), A., i, 626.(Tolyl compounds, $Me=1$.)1-*o*-Tolyl-2-methylbenzimidazole, dinitro-6-hydroxy-, and its acetyl derivative, and its ethyl ether (MELDOLA and HAY), T., 1673.*o*-Tolylmethylcyanamide (v. A.), i, 685.*p*-Tolylmethylcyanamide (v. A.), i, 626.*o*-Tolyl-*o*-methylmesatin (v. MISLENSKY), A., i, 82.*p*-Tolyl-*p*-methylmesatin (v. MISLENSKY), A., i, 89.1-*p*-Tolyl-3-methylpyrazole-5-*p*-acid and its derivatives (M. and DULK), A., i, 692.1-*p*-Tolyl-3-methylpyrazolone, and its derivatives (M. and DULK), A., i, 691.2-*p*-Tolyl-4-methylpyrimidine-6-chloro-, 6-thio-, 6-thio-6-thiocarbimido-derivative (v. STOREY, and Mc-COLLUM), S33.*b*-*p*-Tolyl- α -naphthylcarbamyl hydroxy- (SCHEIDER and DEJ), A., i, 725.*o*-Tolyl nitrosoamine, *N*-benzoyl- derivative (JACOBSON and HUPF), 299.

4-Tolyl-4:7-dimethylhydroxy- (FRIES and KLOSTERMANN), 822.

 β -*p*-Tolylpropionic acid, β -hydroxy-, synthesis of, and its ethyl salts (ANDRIEWSKY), A., i, 7.3-*m*-Tolylrhodanic acid and its reaction with aldehydes (ANN), A., i, 683.*m*-Tolyl- ψ -thiocarbinacetate ester (ANDREASCH), A., i, 689.*p*-Tolylthioacetic acid, preparation (KALLE & Co.), A., i, 605.*p*-Tolylthiopyrine (MICHAEL DULK), A., i, 691.*p*-Tolylthiuret, action of aremate and hydrazines on (FROMM and EB), A., i, 701.2-Tolyl-*o*-tolylodonium salts. (WILLGERODT and KOE), A., i.

Tomatoes, ripening of (ALBAHAR), ii, 771.

Tourmaline from Asmara, S (SERRA), A., ii, 116.

new mineral occurring with in gascar (LACROIX), A., ii, 766.

Toxicological investigations, conducted in (BIGISELLI), A., i, 40.

INDEX OF SUBJECTS.

- isolation of traces of mineral
s from saline* mixtures in
E., A., ii, 62.
- on in the dark of fluorescent
ces on, and its reversibility
and JOELRAUER, A., ii,
- Tetanus toxin.
- ides (MINZ), A., ii, 413.
- ureolysis, chemistry of (ZELL-
), ii, 216.
- ce numbers. See under Electro-
y.
- ation, law of, in stages and
ctivity (SCHMIDT), A., ii, 550.
- al, of isomerides under the
ce of chemical induction
(KAR), A., i, 750.
- concentrations. See under
y, chemical.
- See under Thermochemistry.
- steaceous, aluminium in
A., ii, 885.
- ethylbaptigenetin (GORTER),
See also under the parent
licane (RUFF), A., i, 966.
- Mercurium and its chloride,
ite, hydroxide, iodide, and
loride (HUTCHER and SMILES),
- Alphonium and its platin-
(SMILES and LE ROSSIGNOL),
- preparation of (MICHAELIS),
71; (GOLDSCHMIEDT), A., i,
- anthralenoid, azo-derivatives
LIA & Co.), A., i, 482.
- aldehyde (FORSTER and
T., 1865; P., 227.
- ic acid and its salts, ethyl
and amide (FORSTER and
T., 72.
- ion constants of (PHILIP), T.,
P., 114.
- one (*acetonphazone*) and its
and semicarbazone, and the *p*-
sulphonic derivative of the
(FORSTER and FIERZ), T., 72.
- utanone-2 and its semicarb-
and its oxime and its *p*-toluene-
nyl derivative, and 3-Triazo-
one-2 and its semicarbazone
TER and FIERZ), T., 675; P.,
- compounds, refraction and dis-
sion of (PHILIP), T., 918; P.,
4.
- nation of nitrogen in (RICHMOND),
, ii, 530.
- Triazoethyl alcohol (2-triazoethanol-1)
and its acetate and *p*-nitrobenzoate
(FORSTER and FIERZ), T., 1865; P.,
227.
- Triazofornic acid, ethyl ester (FORSTER
and FIERZ), T., 81.
- Triazo-group, the (FORSTER and FIERZ),
T., 72, 669, 1070, 1174, 1859, 1865;
P., 54, 102, 143, 226, 227.
- Triazole derivatives from dinitriles (v.
MEYER and SCHUMACHER), A., i, 912.
- 1:3:4-Triazole, 1-amino-2-thiol- (STOLLÉ
and BOWLES), A., i, 474.
- γ -Triazopropane, $\alpha\beta$ -dibromo- (FORSTER
and FIERZ), T., 1178.
- α -Triazopropionic acid and its ethyl
ester, silver salt, and amide (FORSTER
and FIERZ), T., 671; P., 54.
- resolution of, and its reduction to
alanine, and the levo-acid and its
brucine salt, ethyl ester, and amide
(FORSTER and FIERZ), T., 1859;
P., 226.
- dissociation constants of (PHILIP), T.,
925; P., 114.
- 3-Triazopropionic acid, ethyl ester
(FORSTER and FIERZ), T., 674; P., 54.
- Tribenzoyl-. See under the parent
Substance.
- Tribenzyl-silicic acid and -silicic chloride
(ROBINSON and KIPPING), T., 450;
P., 25.
- Tribenzylsulphine salts (HOFMANN and
OTT), A., i, 84.
- Triboluminescence of mineral substances
(KARL), A., ii, 549.
- of racemic compounds (GERNEZ), A.,
ii, 748.
- Tricalcium phosphate. See under
Calcium.
- Tricarballylic acid, glucinum salt (TANA-
TAR and KUROVSKI), A., i, 758.
- Tricarbon series (WOHL, SCHWETZER,
KOPPEL, ROTH, and LANGE), A., i, 941.
- Triethylcarbinol, chloro-. See Diethyl-
 β -chloroethylcarbinol.
- Triketone, $C_{10}H_{16}O_3$, from the sodium
derivative of acetylacetone and β -
chloroethyl ethyl ketone (BLAISE and
MAIRE), A., i, 391.
- Trimellitic acid, preparation of
(SCHULTZ), A., i, 356.
- 3:4:5-Trimethoxy-1-allylbenzene. See
Elemicin.
- Trimethoxyanthraquinone, hydroxy-
(BENTLEY and WEIZMANN), T., 437;
P., 52.
- 3:4:5-Trimethoxybenzaldehyde. See Tri-
methylgallaldehyde.
- 3:4:5-Trimethoxybenzoic acid and nitro-
and their ethyl esters (POLLAKE and
FELDSCHAREK), A., i, 543.

- 3:4:5-Trimethoxybenzonitrile** (SEMMLER), A., i, 558.
- 3:4:5-Trimethoxybenzoyl cyanide** (MAUTHNER), A., i, 348.
- Trimethoxy-2-benzoylbenzoic acid**, 2:3:4'-(or 3:4:5') (BENTLEY and WEIZMANN), T., 436; P., 52.
- 4:5:4'-Trimethoxy-2-benzoylbenzoic acid**, 2'-hydroxy-, preparation of (PERKIN and ROBINSON), T., 513.
- Trimethoxybenzylidenebisacetophenone** (MAUTHNER), A., i, 729.
- Trimethoxybenzylquinoxalones** (MAUTHNER), A., i, 986.
- 2:5:10-Trimethoxybrazan** (v. KOSTANECKI and LAMPE), A., i, 907.
- 2:7:8-Trimethoxybrazanquinone**, trinitro- (v. KOSTANECKI and LAMPE), A., i, 907.
- 7:4:5'-Trimethoxy-2:3-indenobenzopyranol(1:4) salts** (PERKIN and ROBINSON), T., 1106.
- 7:4:5'-Trimethoxy-4:3-indenobenzopyranol(1:4) salts** (ENGELS, PERKIN, and ROBINSON), T., 1149.
- anhydrochloride, attempt to synthesise (ENGELS, PERKIN, and ROBINSON), T., 1152.
- 7:8:4'-Trimethoxy-4:3-indenobenzopyranol(1:4) anhydroferriehloride**, 5'-hydroxy- (ENGELS, PERKIN, and ROBINSON), T., 1151.
- 2:4:3'-Trimethoxy-6-methylbenzoylacetophenone** (TAMBOUR), A., i, 350.
- Trimethoxy-4-methylbenzoylacetophenones**, 2:6:2', 2:6:3', and 2:6:4' (TAMBOUR), A., i, 358.
- 3:4:5-Trimethoxy- α -methylcinnamic acid** (MAUTHNER), A., i, 729.
- α -4:5-Trimethoxy-8-phenoxy-8-phenylisobutyric acid**, 2:5:2'-trihydroxy-, lactone of, and its acetyl derivative (ENGELS, PERKIN, and ROBINSON), T., 1156.
- 3:4:5-Trimethoxyphenylacetic acid** (*methylidic acid*, *trimethylhomogallie acid*), synthesis of (MAUTHNER), A., i, 986.
- and its methyl ester (SEMMLER), A., i, 558.
- Trimethoxyphenylglyoxylic acid** and its phenylhydrazine and amide (MAUTHNER), A., i, 348.
- α -Trimethoxyphenyl-8-naphthacinchonic acid** (MAUTHNER), A., i, 729.
- 3:4:5-Trimethoxyphenylpyruvic acid** and its oxime (MAUTHNER), A., i, 986.
- Trimethoxyphthalic acid** from columbamine methyl ether (FEIST), A., i, 102.
- 3:4:6-Trimethoxyphthalic acid**. See Gallcarboxylic acid trimethyl ether.
- 3:4:5-Trimethoxy-1-propenyl**. See *iso*Elenicin.
- Trimethoxytriphenylcarbinol**, acetyl derivative (HERRMANN), A., i, 551.
- $\alpha\alpha$ -Trimethyladipic acid** (AUWERS and HENSEN), A., i, 601.
- 1:3:5-Trimethylalbenzene**, 8-enetrialddehyde.
- γ -Trimethylaminoacetacetic cyano-, ethyl ester, β -lactone** (A.), i, 601.
- Trimethylaminodiphenylmethane**, its nitroso-derivative (v. E.), i, 685.
- Trimethylbrazilein and its salts** (ENGELS, PERKIN, and ROBINSON), T., 1133.
- Trimethylbrazilone** (ENGELS and ROBINSON), T., 114; constitution of (PERKIN and ROBINSON), T., 488.
- ψ -Trimethylbrazilone**, oxime, 2-carboxy-4:5-dimethoxyphenyl acid (PERKIN and ROBINSON), T., 488.
- 1:5-dimethylcarbazole** and its salts (v. E.), i, 685.
- Trimethylcarbinol** and phenyl ether of solutions of (PATERSON), A., i, 383.
- menthylurethane of (VALL), i, 976.
- Trimethylcarbinol**, amine, platinumchloride (KRASSUSKY), T., 139.
- 3:4:5-Trimethylcarbonatobenzene** and its bromo-derivative and salt, and its chloride salt (FISCHER), A., i, 893.
- p*-Trimethylcarbonatobenzoyl acid** (FISCHER), A., i, 893.
- 3:4:7-Trimethylcoumarin** and its salts, oxime, and phenyl ether (CLAYTON), T., 529; P., 26.

 2,5-dihydroxy-, preparation of its copper salt (FISCHER and SAMER), A., i, 858.
 hydroxy-, lactone of (BOUDRY), A., i, 538.
 2-Methylbutyric acid.
 acid, α -amino-, oxidation of, hydrogen peroxide (DAKIN), 80.
 (FISCHER and SCHEIBLER), 321.
 Y-, and its optical properties (FISCHER and SCHEIBLER), A., i, 321.
 d group, hypnotic action of (DER ECKHOUT), A., ii, 55.
 chloride, d - α -bromo- (FISCHER and SCHEIBLER), A., i, 858.
 carbamide, bromo-. See Ural.
 preparation of (KNOLL & Co.), i, 399.
 preparation of (KNOLL & Co.), 69.
 thylamide (EINHORN), A., i, 957.
 lysine, d - α -bromo-, and d -azine salt, and their optical properties (FISCHER and SCHEIBLER), 321.
 eneacetone and its semicarbazone (RUPPE and SCHMIDT), A., i, 13.
 etamide (EINHORN), A., i, 957.
 none, α -bromo-, preparation of (KNOLL & Co.), A., i, 1004.
 valeric acid, ethyl ester (FISCHER and SCHEIBLER), A., i, 760.
 valine, d - α -bromo- (FISCHER and SCHEIBLER), A., i, 958.
 2-, derivatives of (FISCHER and SCHEIBLER), A., i, 957.
 See α -Methylbutyric acid, 2-
 anhydride (FISCHER and SCHEIBLER), A., i, 953.
 safety (STOLTZENBERG), A., i, 953.
 le and 2-Valyl- γ -valine ethyl ester and their hydrochlorides (FISCHER and SCHEIBLER), 321.
 and Vanadates. See under Vanadium.
 alloys with iron (VOGEL and SCHMIDT), A., ii, 502.
 Vanadium difluoride (MANCHOT and FISCHER), A., ii, 47.
 Vanadic acid, reduction of, by magnesium and zinc (GOOCH and EDGAR), A., ii, 540.
 reduction of, by potassium iodide (WARYNSKI and MDIVANI), A., ii, 953.
 and chromic acid, iodometric estimation of, in presence of each other (EDGAR), A., ii, 989.
 and molybdic acid, estimation of, in presence of one another (EDGAR), A., ii, 540.
 Vanadates, stannometric estimation of (WARYNSKI and MDIVANI), A., ii, 636.
 acid, of univalent metals, spitting of the (FRANDEL and MÜRSCHHAUSER), A., ii, 46.
 Hypovanadic acid and some of its compounds (GAIN), A., ii, 598.
 hydrated, an isomeric modification of (GAIN), A., ii, 234.
 Vanadium aluminium silicides (MANCHOT and FISCHER), A., ii, 46.
 sulphide, naturally-occurring. See Rizopatrouite.
 Vanadium, estimation of, in iron and steel (CAMPELL and WOODHAMS), A., ii, 901.
 estimation of, in steel (BLAIR), A., ii, 900.
 and iron, estimation of, in presence of each other (EDGAR), A., ii, 736.
 simultaneous volumetric estimation of, in ferro-vanadium (WARYNSKI and MDIVANI), A., ii, 736.
 Vanillic acid, 2-bromo- (ROBERTSON), T., 792.
 Vanillin, preparation of, from guaiacol (ROESLER), A., i, 348.
 methylation of (DECKER and KOCH), A., i, 35.
 new isomeride of, from the root of a species of Chlorocodon (GOULDING and PELLY), P., 62.
 trimethylene ether and its aniline derivative and oxime (GATTERMANN), A., i, 35.
 Vanillylidene carbamidoxime (CONDUCHE), A., i, 155.
iso-Vanillonitrile. See Guaiacol, 5-cyano-.
 Vanillyldimethylcarbinol and its isomeride (BÉHAL and TIEFFENAU), A., i, 631.
 Vanillylideneacetone hydrochloride (FRANCESCOINI and CUSMANO), A., i, 803.

- Vanillylidene cinnamylidene acetone**
(FRANCESCONI and CUSMANO), A., i, 802.
- Vanthoffite** and langbeinite (NACKEN), A., ii, 692.
- Vaporisation** (v. JÜPTNER), A., ii, 663, 810.
- Vapour density**, new method suggested for determining (BLACKMAN), P., 8; A., ii, 157, 564.
determinations at very high temperatures (v. WARTENBERG), A., ii, 86.
use of charcoal in (DEWAR and JONES), A., ii, 258.
apparatus, Victor Meyer's, simple form of release for (PATTERSON), A., ii, 156.
See also Density.
- Vapour pressure** and ignition temperature, relation between of inflammable liquids of low boiling point (CHARITSCHKOFF), A., ii, 255.
and osmotic pressure of strong solutions (CALLENDAR), A., ii, 671.
of a volatile solute (CALLENDAR), A., ii, 1019.
of solutions, determination of, with the Morley gauge (TOWER), A., ii, 811.
reciprocal actions of dissolved substances as deduced from their (WROCZYNSKI), A., ii, 662.
- Vapour pressure interpolation formula**, new (BOSE), A., ii, 84.
- Vapours**, organic, supersaturation and nuclear condensation of (LABY), A., ii, 797.
- Vaso-dilatin** (POPIELSKI), A., ii, 1059.
- Vaso-motor apparatus**, action of barium chloride, adrenaline, and peptone on the (POPIELSKI), A., ii, 1059.
- Vegetable juices**, constant composition of, obtained by successive extractions (ANDRÉ), A., ii, 217.
organs, physiological function of potassium in (STOKLASA), A., ii, 417.
poisons. See Poisons.
substances, method for the complete analysis of (ALBAHARY), A., ii, 327.
estimation of potassium in (SCHENKE), A., ii, 321.
- Vegetables**, nitrates in (RICHARDSON), A., ii, 208.
organic compounds of nitrogen, phosphorus, and sulphur in (STUTZER), A., ii, 124.
- Vegetation**, influence of manures on. See Manurial experiments, Plants, and Soils.

INSTRUCTIONS TO ABSTRACTORS,

GIVING THE

ENCLOSURE AND SYSTEM OF NOTATION

ADOPTED IN THE ABSTRACTS.

One of the objects of the abstracts of chemical papers published elsewhere in the Transactions of the Society is to furnish the Fellows with an account of the progress of chemical science from month to month. It must be understood that as the abstracts are prepared for the information of the Fellows in general, they cannot possibly be so full or so detailed as to obviate on the part of those who are engaged in special investigations the necessity of consulting the original memoirs.

The abstracts of papers must be given literally.

When beginning to write the abstract, the whole of the original paper should be read, in order that a judgment may be formed of its scope and of the scale on which the abstract should be made. In the case of papers dealing with subjects not strictly chemical, the abstract should refer only to matters of chemical interest in the

The abstract should consist mainly of the expression, in the author's own words, of the substance of the paper.

The abstract should be made as short as is consistent with a concise and accurate statement of the author's results.

A concise statement showing the general trend of the investigation should be given at the commencement of those abstracts where the original permits of it.

In the case of an abstract of a paper on the same subject, either by the author of the paper abstracted, or by some other author, has already been abstracted, note should, as a rule, be made of this fact.

A paper which has appeared once in the *Abstracts* is not to be reabstracted; again, a reference being given to the volume in which the paper may be found.

As a rule, details of methods of preparation or analysis, or of the mode of speaking of work, are to be omitted, unless such details are necessary to the understanding of the results, or have some independent value. Further, comparatively unimportant compounds, such as organic salts of organic bases or acids, should be mentioned only. On the other hand, data such as melting and boiling points, specific rotation, &c., must be given in every case unless they have been given in earlier papers.

Nomenclature.

10. Employ names such as *sodium chloride*, *potassium nitrate*, etc., for inorganic compounds, and use the terminals *ous* and *ic* in distinguishing compounds of different orders derived from the same elementary radicle; such, for instance, as mercurous and mercuric chlorides, sulphurous and sulphuric acids.

11. Term compounds of metallic radicles with the terminal *hydroxides* and not *hydrates*, the name *hydrate* being reserved for compounds supposed to contain water of combination or crystallization.

12. Term salts containing an amount of metal equivalent to the replaceable hydrogen of the acid, *normal* and not *neutral*; assign names such as sodium hydrogen sulphate, disodium hydrogen phosphate, &c., to the acid salts. Basic salts as a rule are designated merely by their *formule*.

13. Names in common use for oxides should be employed. Example: NO, nitric oxide; CO₂, carbon dioxide; P₄O₁₀, phosphoric oxide; As₂O₃, arsenious oxide; Fe₂O₃, ferric oxide.

14. In open chain compounds, Greek letters must be used to indicate the position of a substituent, the letter α being assigned to the carbon atom in the formula, except in the case of CN or other groups. For example, CH₃·CH₂·CH₂·CH₂·I α -iodobutane, CH₃·CH₂·C≡CH α -cyanopropene.

15. Isomeric open chain compounds are most conveniently represented as substitution derivatives of the longest carbon chain. For example,

$\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3\text{CH}_2\text{CH} > \text{CH} \cdot \text{CH} < \begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 \end{array} \end{array}$ or CH₃·CH₂·CHMe·CHMe should be termed β -dimethylpentane, not methyl-ethyl-methane, and $\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3\text{CH} > \text{CH} \cdot \text{CH} < \begin{array}{c} \text{CH}_3 \\ | \\ \text{CO}_2\text{H} \end{array} \end{array}$ or CH₃·CHMe·CH(CO₂H)₂ should be termed $\alpha\beta$ -dimethylbutyric acid, not $\alpha\beta\beta$ -trimethylbutyric or α -methylisovaleric, or methylisopropylacetic acid.

16. Use names such as methane, ethane, &c., for the paraffin or hydrocarbon series of the C_nH_{2n+2} series of CH₄, (CH₂)_n, &c. Term the hydrocarbons C₂H₂ and C₃H₄ ethene and acetylene respectively (not ethene and ethine). For the ethylene series are to be indicated by the suffix *-ene*, and for the acetylene series, wherever possible, by *-yne*. Adopt the name *allene* for the hydrocarbon CH₂·C=CH₂.

17. Distinguish all hydroxyl derivatives of hydrocarbons ending in *ol*. Alcohols should be spoken of as monohydric, according to the number of OH-groups. Compounds are not alcohols, but for which names ending in *ol* have been assigned, are to be represented by names ending in *ol*, if a system cannot be given, thus anisole not anisol, indole not indol. Such as MeONa, EtONa, &c., should be termed sodium methyl ethoxide, &c.

18. The *radicles* indicated in the name of a compound

the order fluoro-, chloro-, bromo-, iodo-, nitro-, nitroso-, amino-, cyano-, thiocyno-, hydroxy-, keto-.

Compounds analogous to the acids of the lactic series containing hydroxy-groups should be termed *hydroxy-*derivatives, and not *oxy-*derivatives; for example, hydroxyacetic and not oxyacetic acid. Compounds containing the analogous groups OEt, OPh, OAc, &c., should in like manner be termed ethoxy-, phenoxy-, acetoxy-derivatives. Thus ethyl-lactic acid, $\text{OEt}\cdot\text{CHMe}\cdot\text{CO}_2\text{H}$, instead of ethyl-lactic acid; diethylproto-*l*-benzoic acid, $(\text{OEt})_2\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$, instead of diethylproto-*l*-benzoic acid; and *o*-acetoxypropionic acid, $\text{OAc}\cdot\text{CHMe}\cdot\text{CO}_2\text{H}$, instead of *o*-acetoxypropionic acid. Terms such as diethylprotocatechuic acid should be understood to mean a compound formed by the displacement of hydroxyl groups in the hydrocarbon radicle of protocatechuic acid by ethyl groups, $\text{C}_6\text{H}_3\text{Et}_2(\text{OH})_2\cdot\text{CO}_2\text{H}$, and not $\text{C}_6\text{H}_3(\text{OEt})_2\cdot\text{CO}_2\text{H}$, just as protocatechuic acid is understood to be the name of a compound with the formula $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})_2\cdot\text{CO}_2\text{H}$.

The term *ether* should be restricted to the oxides of hydrocarbons and their derivatives, and the esters (so-called compounds or ethereal salts) should be represented by names similar to those given to metallic salts.

When a substituent is one of the groups NH_2 , NHR , NR_2 , NH or N , the name should end in *ine*; for example, β -aminopropionic acid, $\text{H}_2\text{N}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, β -anilino-acrylic acid, $\text{NHPh}\cdot\text{CH}=\text{CH}\cdot\text{CO}_2\text{H}$, *o*-anilino-*l*-propionic acid, $\text{NH}\cdot\text{CMe}\cdot\text{CO}_2\text{H}$.

Compounds of the radicle SO_3H should, whenever possible, be termed sulphonic acids, or failing this, sulpho-compounds; for example, *o*-sulphonic acid, sulphobenzoic acid.

Basic substances should invariably be indicated by names ending in *ine*, as aniline instead of anilin, the termination *in* being used for certain neutral compounds, viz., glycerides, glucosides, alkaloids, and proteins, such as palmitin, amygdalin, albumin. Compounds of basic substances with hydrogen chloride, bromide, iodide, &c., should always receive names ending in *ide* and not *ate*, as hydrochloride and not morphine hydrochlorate.

The Collective Index, 3rd decade (1893-1902) should be adopted as the standard of reference on questions of nomenclature not provided for in the preceding sections.

Notation.

In empirical formulae the elements are to be given in the order O, N, Cl, Br, I, F, S, P, and the remainder alphabetically. Abbreviations should be omitted unless essential to the understanding of the results; as a rule, they should not be written on a separate line, but should "run on" with the text.

To economise space, it is desirable:

- 1) That *dots* should be used instead of *dashes* in connecting contiguous symbols or radicles, whenever this does not interfere with the clearness of the formula.

- (b) That formulæ should be shortened by the employment of the symbols Me for CH_3 , C_2H_5 , Pr^a for $\text{CH}_3\cdot\text{CH}_2\cdot\text{CH}_3$, Pr^s for $\text{CH}_3(\text{CH}_2)_2$ for C_6H_5 , Py for $\text{C}_5\text{H}_4\text{N}$, Ac for $\text{CO}\cdot(\text{CH}_3)_2$, and CO-C₆H₅.

- (c) That formulæ should be written *in one line* so that this can be done without obscuring their meaning.

28. In representing the constitution of benzene derivatives the relative positions of the radicles in the symbol of benzene should be indicated by numerals, instead of by means of the hexagonal figure.

- (a) The abbreviations *o*-, *m*-, and *p*-, should be used; of 1:2- or ortho-, 1:3- or meta-, and 1:4- or *p*-.
 (b) In numbering positions in the case of substitution derivatives of phenol, aniline, benzonitrile, benzenesulphonic acid, benzaldehyde, and the characteristic radicle of each of these substances is to be regarded as in position 1 (Collective Index).
 (c) Names of substitution derivatives should be such a way that the position of the substituent is indicated by a numeral prefixed; for example

29. In representing the constitution of derivatives of other "chain" hydrocarbons, graphic formulae should not be employed; the system of numbering positions indicated in Richter's *Lehrbuch der Kohlenstoff-Verbindungen* (2nd edition 1899, pp. 16-26) should be used, of which the following schemes may be regarded as typical.

Manuscript.

view of the difficulty of dealing with MSS. of widely varying
abstracts cannot be accepted unless written on quarto paper

more than one abstract must appear on a sheet.

When an abstract exceeds a sheet in length, the sheets must be
together by means of a pin at the top left-hand corner.

The name of the abstractor must be written diagonally at the
bottom corner of the first sheet of the abstract.

Proofs.

Abstractors are expected to read and correct proofs carefully,
checking all formulae and figures against MSS.

Proofs, however small, must be returned to the Sub-Editor
within 24 hours after receipt from the printers.

The Editor's decision, in all matters connected with the
manuscript, must be considered final.

The numbering, proposed originally by E. Fischer, is adopted in the text of the

JOURNALS FROM WHICH ABSTRACTS ARE MADE

Journal de Physique.	Journal de Physique.
Journal für praktische Chemie.	Journal für praktische Chemie.
Journal of the Royal Agricultural Society.	Journal of the Royal Agricultural Society.
Journal of the Royal Society of New South Wales.	Journal of the Royal Society of New South Wales.
Journal of the Physical and Chemical Society of Russia.	Journal of the Physical and Chemical Society of Russia.
Journal of the Society of Chemical Industry.	Journal of the Society of Chemical Industry.
Journal of the Society of Dyers and Colourists.	Journal of the Society of Dyers and Colourists.
Kongl. Svenska Vetenskaps-Akademiens Handlingar.	Kongl. Svenska Vetenskaps-Akademiens Handlingar.
The Lancet.	The Lancet.
Die landwirtschaftlichen Versuchs-Stationen.	Die landwirtschaftlichen Versuchs-Stationen.
Memorie della Reale Accademia delle Scienze di Torino.	Memorie della Reale Accademia delle Scienze di Torino.
Memoirs of the College of Science and Engineering Kyôto Imperial University.	Memoirs of the College of Science and Engineering Kyôto Imperial University.
Memoirs and Proceedings of the Manchester Literary and Philosophical Society.	Memoirs and Proceedings of the Manchester Literary and Philosophical Society.
Metallurgie.	Metallurgie.
Milchwirtschaftliches Zentralblatt.	Milchwirtschaftliches Zentralblatt.
Mineralogical Magazine and Journal of the Mineralogical Society.	Mineralogical Magazine and Journal of the Mineralogical Society.
Monatshefte für Chemie und verwandte Theile anderer Wissenschaften.	Monatshefte für Chemie und verwandte Theile anderer Wissenschaften.
Il Nuovo Cimento.	Il Nuovo Cimento.
Archiv für die gesammte Physiologie des Menschen und der Thiere.	Archiv für die gesammte Physiologie des Menschen und der Thiere.
Pharmaceutical Journal.	Pharmaceutical Journal.
Pharmaceutical Review.	Pharmaceutical Review.
Pharmaceutisch Weekblad.	Pharmaceutisch Weekblad.
Pharmazeutische Zeitung.	Pharmazeutische Zeitung.
Pharmazeutische Zentrallhalle.	Pharmazeutische Zentrallhalle.
Philippine Journal of Science.	Philippine Journal of Science.
Philosophical Magazine (The London, Edinburgh and Dublin).	Philosophical Magazine (The London, Edinburgh and Dublin).

JOURNALS FROM WHICH ABSTRACTS ARE MADE

ABBREVIATED TITLE.	JOURNAL.
<i>Phil. Trans.</i>	Philosophical Transactions of the Royal London.
<i>Physikal. Zeitsch.</i>	Physikalische Zeitschrift.
<i>Proc. Amer. Physiol. Soc.</i>	Proceedings of the American Physiological Society.
<i>Proc. Camb. Phil. Soc.</i>	Proceedings of the Cambridge Philosophical Society.
<i>Proc. K. Akad. Wetensch. Amsterdam.</i>	Koninklijke Akademie van Wetenschappen Amsterdam. Proceedings (English version).
<i>Proc. Phil. Soc. Glasgow</i>	Proceedings of the Glasgow Philosophical Society.
<i>Proc. Physiol. Soc.</i>	Proceedings of the Physiological Society.
<i>Proc. Roy. Soc.</i>	Proceedings of the Royal Society.
<i>Proc. Roy. Soc. Edin.</i>	Proceedings of the Royal Society of Edinburgh.
<i>Quart. J. exp. Physiol.</i>	Quarterly Journal of experimental Physiology.
<i>Quart. J. Geol. Soc.</i>	Quarterly Journal of the Geological Society.
<i>Rec. trav. chim.</i>	Recueil des travaux chimiques des Pays-Bas. Belgique.
<i>Rend. Accad. Sci. Fis. Mat. Napoli.</i>	Rendiconto dell' Accademia delle Scienze Matematiche-Napoli.
<i>Rev. de Metallurgie</i>	Revue de Metallurgie.
<i>Rev. intern. Falsif.</i>	Revue internationale des Falsifications.
<i>Sci. Proc. Roy. Dubl. Soc.</i>	Scientific Proceedings of the Royal Dublin Society.
<i>Sci. Trans. Roy. Dubl. Soc.</i>	Scientific Transactions of the Royal Dublin Society.
<i>Sitzungsber. K. Akad. Wiss. Berlin.</i>	Sitzungsberichte der Königlich Preussischen Akademie der Wissenschaften zu Berlin.
<i>Sitzungsber. K. Akad. München.</i>	Sitzungsberichte der königlich bayerischen Akademie der Wissenschaften zu München.
<i>Trans. Amer. Electrochem. Soc.</i>	Transactions of the American Electrochemical Society.
<i>Trans. Amer. Inst. Mining Eng.</i>	Transactions of the American Institute of Engineers.
<i>Trans. Faraday Soc.</i>	Transactions of the Faraday Society.
<i>Trans. Nova Scotia Inst. Sci.</i>	Transactions of the Nova Scotia Institute of Science.
<i>Trans. Path. Soc.</i>	Transactions of the Pathological Society.
<i>Trans. Roy. Soc. Canada</i>	Transactions of the Royal Society of Canada.
<i>Trans. Roy. Soc. Edin.</i>	Transactions of the Royal Society of Edinburgh.
<i>Trans. Roy. Irish Acad.</i>	Transactions of the Royal Irish Academy.
<i>Tsch. Min. Mitt.</i>	Tschermak's Mineralogische Mitteilungen.
<i>U.S.A. Dept. Agric. Bull.</i>	Bulletins of the Department of Agriculture.
<i>U.S.A. Dept. Agric. Rep.</i>	Reports of the Department of Agriculture.
<i>Verh. des deut. Naturforsch. Aerzte.</i>	Verhandlung der Gesellschaft deutscher Naturforscher und Aerzte.
<i>Wiss. Abhandl. Phys.-Tech. Reichsanstalt.</i>	Wissenschaftliche Abhandlungen der Physikalisch-Technischen Reichsanstalt.
<i>Zeitsch. anal. Chem.</i>	Zeitschrift für analytische Chemie.
<i>Zeitsch. angew. Chem.</i>	Zeitschrift für angewandte Chemie.
<i>Zeitsch. anorg. Chem.</i>	Zeitschrift für anorganische Chemie.
<i>Zeitsch. Biol.</i>	Zeitschrift für Biologie.
<i>Zeitsch. Chem. Ind. Kolloide.</i>	Zeitschrift für Chemie und Industrie der Kolloide.
<i>Zeitsch. Elektrochem.</i>	Zeitschrift für Elektrochemie.
<i>Zeitsch. Farb.-Ind.</i>	Zeitschrift für Farben-Industrie.
<i>Zeitsch. Kryst. Min.</i>	Zeitschrift für Kristallographie und Mineralogie.
<i>Zeitsch. Nahr. Genussm.</i>	Zeitschrift für Untersuchung der Nahrungsmittel und Genussmittel.
<i>Zeitsch. öffentl. Chem.</i>	Zeitschrift für öffentliche Chemie.
<i>Zeitsch. physikal. Chem.</i>	Zeitschrift für physikalische Chemie, Elektrochemie und Verwandtschaftslehre.
<i>Zeitsch. physiol. Chem.</i>	Hoppe-Seyler's Zeitschrift für physiologische Chemie.
<i>Zeitsch. prakt. Geol.</i>	Zeitschrift für praktische Geologie.
<i>Zeitsch. Ver. deut. Zuckerind.</i>	Zeitschrift des Vereins der deutschen Zuckerindustrie.
<i>Zeitsch. wiss. Photograph. Photophysik. Photochem.</i>	Zeitschrift für wissenschaftliche Photographie, Physik und Photochemie.
<i>Zeitsch. Zuckerind. Böhm.</i>	Zeitschrift für Zuckerindustrie in Böhmen.
